Musical Revivals.—The ever welcome works of Gilbert and Sullivan were wittily revived in three lengthy tours of London's authoritative D'Oyly Carte company, and there were American revivals of them by the Boston Comic Opera company and the Gilbert and Sullivan Opera company. The Mikado survived consternating changes when the score was tricked with jazz rhythms and Negro singers voiced it as a federal enterprise first in Chicago, where it was named The Swing Mikado. Failing in his ambition to take over this production, manager Todd staged his own The Hot Mikado, with the veteran tap-dancer Bill Robinson heading the Negro cast.

The untimely death of George Gershwin in 1937 may have hastened general recognition of the enduring worth of the many compositions he had written in the idiom of jazz. His Porgy and Bess, the libretto based on Du Bose and Dorothy Heyward's Negro folk play, began to gain acceptance even from musicologists as the master work of its genre. During this period it was several times revived in the capital cities and on tour. Jerome Kern's Show Boat was happily revived for a long New York run in 1946. The composer died shortly after the first night of this reproduction, survived by at least a dozen songs that had become a melodious part of the musical consciousness of the American people. Two enormously successful operettas, Blossom Time and The Student Prince, profitably continued their annual tours despite shoddy settings, imperfect casts and resentful reviews. Victor Herbert's ancient The Red Mill, verging on 40 years of age, was the surprise success of the Broadway revivals of 1946. One of its producers was Paula, daughter of Fred Stone, who had starred in the original with Dave Montgomery. Among the imports revived were Oscar Straus' The Chocolate Soldier and Franz Lehar's The Merry Widow, the latter withstanding the tenoric blasts of grand opera's Jan Kiepura.

New Words and Music.—Oklahoma!, based on the Riggs folk-play which the Theatre guild had produced 15 years earlier, was the most undebatably popular of the decade's theatrical offerings. Oklahoma! sounded a new high for the play with music. Its dialogue and lyrics were painless stage literature and its score the most unpretentiously musicianly since George Gershwin's enduring music for Porgy and Bess. Two Theatre guild "no-star" companies voiced it on the eastern and western coasts, and no one challenged the boast that neither of these organizations had ever been confronted with an empty seat. Compared with the costly song-and-ballet plays that followed, Oklahoma! was an inexpensive production. It had to be, for when it was timorously tried out the guild's financial stock pile was as depleted as its dramatic stock pile. But the guild's competitors followed the formula rather than the frugality of Oklahoma!

The abruptly munificent Todd expended a fortune on a spacious cantata re-exposing the scandal of old New York's crooked Tweed Ring and entitled *Up in Central Park*. The guild itself became open-handed in producing the enchanting *Carousel* when it commissioned *Oklahoma's* Rodgers and Hammerstein to Americanize Ferenc Molnar's Hungarian *Liliom*, with Agnes de Mille again devising the stirring associational ballets. The upcoming Billy Rose employed the agile wit of Hammerstein in *Carmen Jones*, his gorgeous and popular all-Negro variation of the opera *Carmen*, thriftily and triumphantly refitting the royalty-less Sevillian music of Bizet to New York's Harlem, where the Spanish bullfighter became a

Negro prize fighter.

As early as 1938 Maxwell Anderson provided in Knickerbocker Holiday a salty libretto for the satirical score of Kurt Weill and the wryly humorous acting of Walter Huston. The psychoanalytic was explored by Weill and librettist Ira Gershwin in an enormous and enormously successful music show by Moss Hart, named Lady in the Dark. But for Gertrude Lawrence's unsparing impersonation of the inhibited lady and Danny Kaye's uninhibited photographer it might not have been so successful. Not unlike the more ribald restoration comedies was George Abbott's fearless staging of John O'Hara's book, Pal Joey, as it had been made vocal by Rodgers and Hart, and was interpreted by Gene Kelly and Vivienne Segal with unflinching candour.

Lorenz Hart died in 1943 just as his and Richard Rodgers' A Connecticut Yankee, after—a long way after—Mark Twain's historical satire, had been revived. This industrious and gifted team had turned out during this period more than half a dozen characteristic hits, including Babes in Arms, I'd Rather Be Right, I Married an Angel, The Boys from Syracuse (an impudently amusing distortion of A Comedy of Errors) and By Jupiter, based on Julian F. Thompson's The Warrior's Husband and justifying the belated but brilliant starship of Ray Bolger, the dancer who was to score again in the Nancy Hamilton-Morgan Lewis revue Three to Make Ready.

Cole Porter, who like Cohan wrote his own lyrics, composed the scores of an even greater number of nationally welcomed music shows. In many of these the leading roles were sung and acted with trumpet power by Ethel Merman, notably Red Hot and Blue, DuBarry Was a Lady (in which she shared the robust comicalities with Bert Lahr), Panama Hattie and Something for the Boys. Other applauded Porter musicals were Leave It to Me, Let's Face It, Mexican Hayride and Seven Lively Arts.

The labour stage, expressing cultural criticism by the International Ladies' Garment Workers, turned out one of the most durable hits of this or any other theatrical period in *Pins and Needles*, with a cast composed of amateurs and semi-professionals.

Irving Berlin, undebatably the nation's most popular song writer, composed and wrote the outstanding soldier show of the World War II period. His This Is the Army, cast with enlisted men still under military discipline and played for the benefit of the Army Emergency Relief fund, was even more enthusiastically received than had been his Yip, Yip, Yaphank of World War I. Berlin's return to the commercial theatre in 1946 resulted in his phenomenally successful Annie Get Your Gun, in which Ethel Merman, as the riflewoman of a Buffalo Bill "Wild West" show, rang yet another bull's-eye. The freak hit among musicals of the period was achieved by Ole Olsen and Chic Johnson when in 1938 they put together the mossy remains of their vaudeville past, called it Hellzapoppin, and ran it for years on Broadway and throughout the country.

Biographical Plays.—There were biographical plays in the flesh as well as in the celluloid. During 1936–38 Helen Hayes was still playing extended engagements in the capitals and mighty tours on the road, impersonating England's best-loved queen in Laurence Housman's Victoria Regina, which marked the summit of her hard-won starship. Five years later she masqueraded as Harriet Beecher Stowe in Florence Ryerson and Colin Clements' Harriet, which ran 377 performances in New York alone and from

which ensued several catastrophic revivals of Mrs. Stowe's Uncle Tom's Cabin.

London's Robert Morley caught the fancy of the more sophisticated playgoers of Manhattan in his reasonable and witty lifelikeness of the poet-playwright in Leslie and Sewell Stokes' Oscar Wilde. That was in 1938, the year in which the Canadian-born American actor Raymond Massey first presented his finely felt and realized portrait of the martyred president in Robert E. Sherwood's brilliant and authoritative Abe Lincoln in Illinois. Hopes that this was the biographical play to end all biographical plays were pleasingly discouraged in the following year when George S. Kaufman and Moss Hart wrote-without objection from the waspish and witty guest lampooned, author Alexander Woollcott-The Man Who Came to Dinner. No actor failed as The Man, not even Woollcott, when after several false starts he nervously certified the caricature in Chicago.

But the most durable of the biographies was dramatized from the autobiographical humoresques of Clarence Day by Howard Lindsay and Russel Crouse in 1939 and entitled Life With Father. The millions collected from the public in the first seven years of this thoroughly delightful comedy, concurrently acted by three companies, would encounter unbelief even if totalized in a trustworthy work of reference. Sidney Kingsley's The Patriots, dealing with the animosities of Jefferson and Hamilton and the godlike patience of Washington in building a young democracy, was a tired piece about tired men and more elegy than drama. Emmett Lavery's The Magnificent Yankee celebrated the domestic rather than the judicial life of the great minority leader of the supreme court, Justice Oliver Wendell Holmes. The mellow dignity of Louis Calhern added to the stature of that actor and balanced an uneven play into a hit.

Modern Plays.—This period proved again that it is not always possible to measure the true worth of a play by the length of its run, nor by the Pulitzer prizes and the awards made by the New York Drama Critics' circle, an organization which was formed in 1935 to protest some of the Pulitzer selections and which eventually uttered many savage unilateral protests against its own findings. Harry Brown's realistic drama of soldiers in action, A Sound of Hunting, produced in 1946, died in two weeks on Broadway, yet continued to live in the admiring references of the more fastidious lay and professional playgoers. Philip Barry's mystical correction of a misguided world, Here Come the Clowns, endured less than three months on Broadway despite good acting and sympathetic direction; and William Saroyan's likeable collection of San Francisco crackpots, The Beautiful People, lasted only two months in New York although a third of the critics voted it the best play of the 1941 season. But in the long run the long runs were in most cases fair appraisals of diversionary, if not dramaturgic value. The "Broadwise" had not forgotten their ivied cliché to the effect that nothing is so dead as a dead play.

Season-by-Season Review.—The over-all popular hit of 1937 was George S. Kaufman and Moss Hart's joyous lunacy, You Can't Take It With You. Other lighthearted successes of the year were Clare Boothe's laughable betrayal of the female nation, The Women; Amphitryon 38, in which Alfred Lunt and Lynn Fontanne sparkled in S. N. Behrman's sportively free translation of Jean Giraudoux's droll notion of Plautus' Amphitryon, or Jupiter in Disguise; Rachel Crothers' Susan and God, an amusing

travesty on Buchmanism that owed its run to the energetic acting of Gertrude Lawrence and Room Service, a George Abbott-directed farce about a war between impecunious stage folk and their unpaid landlord.

Of higher and more serious aim were Maxwell Anderson's High Tor, not quite so successful an adventure in metrical prose as had been his Winterset, and The Star-Wagon, a prose comedy in which time alternately ran clockwise and counter-clockwise. This same season saw John Steinbeck's sometimes cruelly, sometimes compassionately realistic Of Mice and Men, and Clifford Odets' Golden Boy, whose violinist protagonist maimed his gifted hands while debasing them for money in the prize ring.

In 1938 Robert E. Sherwood, Maxwell Anderson, S. N. Behrman, Elmer Rice and Sidney Howard, who died a year later, formed the Playwrights' company, which produced and financed plays written by its members. Their three productions of that season were Sherwood's nationally welcomed Abe Lincoln in Illinois, Anderson's Washington Irvingesque Knickerbocker Holiday (with the musical score by Kurt Weill, who joined the playwrights in 1946, the year in which Behrman retired from the organization), and Rice's swiftly discarded American Landscape.

This was the year in which Thornton Wilder's sceneryless Our Town won critical as well as popular approval, and in which Sir Cedric Hardwicke built up a strong American following through his suave, ironical depiction of the proud and polysyllabic priest in Paul Vincent Carroll's uneven but absorbing Shadow and Substance.

The season saw another Odets play, Rocket to the Moon, which was more mellow but less exciting than his previous social criticisms. Death, the old reliable, was the lighthearted theme of Paul Osborn's On Borrowed Time, in which Dudley Digges was the expiring old gentleman who outwitted the grim reaper while he found a home for his grandson. Clare Boothe, pretending in the published preface that she had written "a political allegory on fascism in America," was represented by Kiss the Boys Good-bye, a laughable pasquinade on Hollywood's highly publicized search for an actress worthy of being photographed as the heroine of Gone With the Wind. And this was the time when adolescence began to be a best-seller in the show shops with Ian Hay's Bachelor Born and Clifford Goldsmith's even more profitable high school comedy, What a Life.

The discriminating Eddie Dowling produced another Carroll comedy-drama in 1939, The White Steed, in which bigotry battled tolerance without a chance and won only laughter. But Dowling's remembered offering of this season was William Saroyan's The Time of Your Life, which immediately established that young short-story writer's reputation as a playwright with a fresh and happy outlook on the native scene and in which the producer, not long graduated from vaudeville, gave a distinguished performance of the leading role. Another outstanding success was Lillian Hellman's The Little Foxes, an astringent comedy of interfamily chicaneries in which Tallulah Bankhead, as the victorious arch-schemer, scored her first definite hit in her own country, and Patricia Collinge sympathetically portrayed the bullied wife who overdrank by stealth.

Ethel Waters, heretofore known only as the foremost Negro songstress of character ballads, was the season's surprising discovery when she made Dorothy and Du Bose Heyward's Mamba's Daughters much more than melodrama by her tragic portrayal of a self-sacrificing mother. The Playwrights brought forth Anderson's Key Largo, which dealt with the conscience of an American soldier who had survived the civil war in Spain, and was the first

significant token of the numerous war plays that were to follow. A forthright token of the many plays of warning against American naziism was Clare Boothe's well-received Margin for Error.

The native comedy of manners was represented by S. N. Behrman's not-too-smooth levity that bore the bodeful title of No Time for Comedy, in which Katharine Cornell made her debut as a comedienne, ably aided by Laurence Olivier; and Philip Barry's Philadelphia Story, a somewhat emotional farce in which Katharine Hepburn found her first stage popularity impersonating a heroine with a stubborn case of arrested spinsterhood; 1939 was the year that saw the birth of Life With Father and The Man Who Came to Dinner.

Ethel Barrymore again came into her very own in 1940 by acting with unblandished straightforwardness the genius-mothering schoolmarm who determinedly fostered a boy poet she had the wit to discover among the grimy coal miners of Wales, in Emlyn Williams' sentimental but strong The Corn Is Green. In a chivalrous effort to pay his debts, her brother John Barrymore, the first Hamlet of the previous generation (he was to die in 1942 and live again in the glowing pages of Gene Fowler's Good Night, Sweet Prince), returned to the stage after too many years in Hollywood as a caricature of himself in a drooling comedy named My Dear Children, wherein the actor interpolated gusty asides that were as sad and pitiful to some members of the audience as they were sidesplitting to others.

Alfred Lunt and Lynn Fontanne, the most accomplished and admired stage couple since England's Mr. and Mrs. Kendal and U.S. E. H. Sothern and Julia Marlowe, triumphed on both shores of the Atlantic in Sherwood's admonitory There Shall Be No Night. James Thurber and Elliott Nugent wrote (the latter appearing in) The Male Animal, a pewter comedy plated with silver acting. Reginald Denham and Edward Percy's deftly written mystery melodrama, Ladies in Retirement, suffered none of the disabilities of sea change when Gilbert Miller imported it from London for the good acting of Flora Robson and others. The farcical fortunes and misfortunes of maiden innocency exposed to the dangers of a great city were entertainingly set forth in My Sister Eileen, a work workmanly dramatized from Ruth McKenney's magazine sketches by John A. Fields and Jerome Chodorov.

Lillian Hellman's Watch on the Rhine, which might have been called It Can Happen Here, was not only 1941's but the decade's most dramatic propaganda against the infiltration of naziism. Here Paul Lukas made a memorabie figure of the briefly visiting German anti-fascist whose American wife, the mother of three polylingual children, was forcefully played by Mady Christians. Exciting theatre (the hunted Negro, who had accidentally killed his white employer's daughter, exchanging shots and oaths with his captors when they charged down the aisles to the stage) was the very human melodrama written by Paul Green from the Negro Richard Wright's urgent social novel Native Son, in which the Negro actor Canada Lee took firm foothold on the American stage.

Life With Father-in-Law might have been a second title for Isabel Leighton and Bertram Block's Spring Again, wherein C. Aubrey Smith's seasoned acting was harmoniously matched by that of Grace George. Playscripts from England that duplicated their success throughout the United States were Noel Coward's fantastical Blithe Spirit, in which a husband was amusingly haunted by the wraiths of his deceased wives, and Patrick Hamilton's adult and tightly-built melodrama, Angel Street. Another long-lasting melodrama was Joseph Kesselring's Arsenic and Old

Lace. Twenty-one lay henchmen of its abruptly wealthy producers, Lindsay and Crouse, profitably hazarded \$1,000 apiece against the failure of a murder comedy that wound up with thirteen visible corpses taking their bows at the final curtain.

This was the year that started "diaper" comedies. Rose Franken's Claudia was a kindergarten of sex, whose beaming girl-bride questioned not only her own biological processes, but those of the cow, the cat, the hen, even the rooster. Jerome Chodorov and Joseph Fields' Junior Miss was a blurred proscenium view of Sally Benson's piercing magazine studies of preadolescence. Its popularity was more easily recorded than justified.

The only "juvenile" in 1942 was the comparatively esculent Janie, whose sixteen-year-old prodigy suffered comically in getting rid of scores of soldiers giving themselves a party in her home during the brief absence of her parents.

Thornton Wilder's spell-casting fantasy, The Skin of Our Teeth, which celebrated man's antlike perseverance in rebuilding a destroyed world from the primitive age of stone to the polished present of Excelsior, New Jersey, was rebuked by a few of the critics for not acknowledging the author's debt to James Joyce's widely unread Finnegans Wake, but with Miss Bankhead in the cast, un Joyceian New Yorkers vouchsafed it a long run. The still incomparable Lunts found and imparted joy in The Pirate, an imperfect but delightfully humorous Behrman adaptation in which Lunt, masquerading as the deadly buccaneer of Miss Fontanne's dreams, altitudinously crossed the stage to her chamber window on a clothesline.

If the war plays did not boom, at least they bombed; detonations were heard beyond the walls of their theaters. The Playwrights' Maxwell Anderson wrote *The Eve of St. Mark*, the transient heroic of an American farm boy who might have lived but for helpfully holding out on Bataan a day longer than honour compelled. It was an improvement on his *Candle in the Wind* of the previous year, whose short season would have been shorter but for the popularity of Helen Hayes. Steinbeck's *The Moon Is Down*, in which German officers as well as those they scourged were presented as victims of naziism, fared no better.

Playgoers seemed to be equally indifferent to war plays "hard" or "soft," and more friendly to the lighter adventures of the war-discomforted at home. Joseph Fields' critic-scolded *The Doughgirls* rejoiced in the turpitude of lodgingless women to whom any bed was home in crowded Washington. The long-to-be-remembered melodrama of the year was Thomas Job's *Uncle Harry*, whose melancholy villain poisoned one sister, fastened the guilt on the other and was regarded as merely a harmless liar by those to whom he confessed.

The year 1943 started the concurrent runs of Oklahoma!, thereby re-establishing the artistic as well as the financial credit of the Theatre guild, which for several seasons had been serving its subscribers in the capitals with the productions of other managements rather than with quickly proven guild failures.

On the more serious side was James Gow and Arnaud d'Usseau's *Tomorrow the World*, a wartime warning in which a precociously evil nazi aged 12 was miraculously reformed in an American home. It was the success of the season's dozen war plays. Moss Hart wrote for the army air forces *Winged Victory*, which was patriotically applauded.

The energetic acting of Elisabeth Bergner was the rea-

sonable excuse for the long run of Martin Vale's The Two Mrs. Carrolls, a poison melodrama that was cyanide to the critical. New York was hospitable for almost two years to Phoebe and Henry Ephron's Three's a Family, a wartime farce about three pregnant women in crowded quarters which was less tolerantly received in other cities. The farce of this year and several following was F. Hugh Herbert's Kiss and Tell, a juvenile which exploited the imagination of an innocent adolescent who sought to save the reputation of her secretly married sister-in-law by declaring herself to be an expectant mother.

But the one hit comparable with the songful Oklahoma! was John van Druten's enduring The Voice of the Turtle, in which this adroit author made relishably touching as well as amusing the prenuptials of a pair of young sinners who had elsewhere previously loved and erred in vain.

There were originality and flavour in the 1944 season. Mary Chase's *Harvey*, with its happily boozing hero, with his invisible but felt and almost seen rabbit, was a novelty indeed. It brought legitimate actorhood not only to Frank Fay of vaudeville and the night-club, but to Bert Wheeler and to Joe E. Brown following his long tour of the army camps overseas.

I Remember Mama was van Druten's skillful compaction of Kathryn Forbes' Mama's Bank Account, which warmly chronicled the lives of a Norwegian family and their dependable matriarch in old San Francisco. This was not only the year of the mentioned Anna Lucasta and the warborn Jacobowsky and the Colonel and A Bell for Adano, but of Lillian Hellman's loose and cluttered antiappeasement preachment The Searching Wind. A poised and polite satire on the higher inhabitants of what had once been called the nation's "Hub" was John P. Marquand and George S. Kaufman's The Late George Apley, which might have been as perfectly entitled There'll Always Be a Boston.

The season's one popular juvenile was Norman Krasna's Dear Ruth, in which the enfant terrible signed her big sister's name to love letters. From Ruth Gordon's twinkling typewriter and for her own enactment came Over 21, a smart little success which encouraged its author to declare herself ready to put by the rabbit's foot for the pen and write an autobiographical comedy.

Height was attained by American playwriting and playacting in 1945 when Tennessee Williams' The Glass Menagerie, following the sensational success of its initial production in Chicago, went to New York. For at least the third time in her career the Laurette Taylor of the youthful Peg o' My Heart, the mature Mrs. Midget of Outward Bound (revived in 1938) and now the burbling mother of a poverty stricken family with her boastful and exaggerated memories of suitors among the southern aristocracy, was acclaimed a great actress. The magic of the theatre was not only in Miss Taylor's performance but in the coordination of setting, lighting and complemental music. Eddie Dowling, who not only directed the four-character play with sympathetic feeling for its poetic overtones, but who had erased the crudeness of the original script, himself acted the role of narrator-son whose memories were the story.

Howard Richardson and William Berney's Dark of the Moon was a "hillbilly" witch's brew fantastically based on the folk ballad of Barbara Allen. It combined tenderness, passion, racy humour and gross comedy, and was justly reckoned a worthwhile contribution to the dramatic literature of the decade. The Hasty Heart, mentioned earlier,

was a wryly likeable Scotch soldier's adventure in dying, and deservedly popular. Sherwood's The Rugged Path was that author's first effort following extended service to the White House and World War II, and despite the reappearance in it of the cinema's Spencer Tracy, this study of a conscience-stricken anti-"isolationist" country editor was more homily than drama. Arnaud d'Usseau and James Gow wrote with less sincerity than had marked their Tomorrow the World a one-sided postwar examination of the Negro problem called Deep Are the Roots, which prospered beyond its dramatic merits. Yet theirs was the best of many arguments on a vital subject.

Lindsay and Crouse's durably successful *State of the Union* played politics without playing favourites. Any party, any politician, was a struck target for its breezy mirth, for at almost every performance the tireless authors telegraphed interpolations to the three companies serving the comedy.

Elmer Rice's *Dream Girl*, whose heroine, one of the longest roles ever written, beguiles her idle hours in a book-rental shop with trances gay and grave, profitably presented that playwrights' playwright as neither preacher nor propagandist and won lasting favour on Broadway and on tour.

The 1946 season, which reached its climax in Eugene O'Neill's *The Iceman Cometh*, was otherwise interesting for the six-weeks visit to New York of London's revitalized Old Vic players in a repertory that included both parts of Shakespeare's *Henry IV*, Chekhov's *Uncle Vanya* and a double bill that contrasted Sheridan's *The Critic* with Sophocles' *Oedipus*.

The Lunts returned from their long stay overseas with Terence Rattigan's Love in Idleness, newly named O Mistress Mine, a comedy more notable for the wit of its acting than its writing. The loudest laughter of the year was for Garson Kanin's Born Yesterday, wherein an illiterate chorus girl is so amazingly educated by a radical newspaper man hired for that purpose that she ultimately ruins the countless rackets of her nefarious protector. Lute Song, Sidney Howard and Will Irwin's picturesque paraphrase of China's ancient Pi-Pa-Ki, whose heroine is the classic oriental model of wifely fidelity, was a dramatic love song of exquisite tenderness and beauty.

The highly dramatic and debatable The Iceman Cometh proved to be a parabling realism densely populated by derelict spongers on a waterfront New York saloon of 1912. In the first of the four long acts one of the besotten boozily philosophized, "The lie of a pipe dream is what gives life to the whole misbegotten mad lot of us, drunk or sober." The final act attested the futility of taking pipe dreams away from the disinherited. While this work was criticized for lacking the diversification of scene and action of O'Neill's earlier "dinner-dramas" whose playing time exceeded four hours-Strange Interlude and Mourning Becomes Electra-its poignant characters and the steadily upclimbing strength of the fable which revealed them as vividly as were the misbegotten of Maxim Gorki's The Lower Depths, caused The Iceman to be regarded as the most distinguished American drama acted in the period considered. Dowling, who directed Williams as Kneisel had led string quartettes, directed O'Neill as Toscanini had conducted symphonies.

Tendencies in the U.S. Drama

During the period 1937–46 the only noticeable tendencies in the drama were as follows:

(1) An increasing concern of dramatists with the behaviour and the problems of the lower classes and the underprivileged.

(2) A tendency to use the theatre as a lecture platform on which the playwright became more important than the characters he created or than the story he was attempting to tell. He had a social or political conviction which he desired to make the audience accept. The proper medium for his views was the pamphlet, the public hall, the soapbox, the periodical essay, the argumentative book or the radio time reserved for commentators with individual and personal views to state.

(3) The decline of the poetic idiom in stage presentations. Not merely had playwrights veered very far away from the poetic forms of the Greek and Elizabethan dramatists, of Jean de Racine and Pierre Corneille and of Edmond Rostand and Carl Hauptmann; they had striven for colloquialisms to such an extent, in their flight from romanticism to naturalism, that going to the theatre was often no more of an aesthetic experience than that of listening to the conversation of one's most boresome neighbours.

(4) The introduction of the ballet-pantomime into musical comedy and the musical play, as a substitute for the chorus routines of old burlesque shows which had developed into what was a distinct American contribution to the theatre—the musical comedy. It was a metamorphosis, deriving from some of the worst features of Slavic and Latin grand opera formulas, seen at its best in Ohlahoma! and Carousel and one or two other Broadway productions during the decade; but it became so repetitious in musical play choreography by 1946 that the public, as well as the critics, revolted against it, and even when a musical had several ballet-pantomime numbers in it, they were not so designated but described as "dance numbers."

(5) The decline of the number of plays of an experimental nature in the treatment of theme and in originality of concept in favour of the time-tested plays designed for the broad base of popular appeal.

(6) The increasing reliance of the commercial producers upon Hollywood "box-office" names for the success of their productions, often without any consideration of the acting ability of the motion picture stars or of their suitability for the parts to which they were assigned.

(7) The rise, during the years of World War II especially, of amateur and semi-professional groups in small towns, universities and large-city cultural centres, more or less subsidized both privately and publicly. The plays put on by such groups were ordinarily those that had been successes on Broadway and they rarely were the work of new or untried writers; but these groups provided an apprenticeship in all aspects of theatrical production, from scenic designing and lighting to acting and from box-office account-management to direction; and so they were a constant source of abundant supply of talent and experience to Broadway and Hollywood. Moreover, in aggregate they paid to authors royalties amounting to close to \$6,000,000 a year on productions for which, in most cases, the prescribed fee to the author was only \$25 a performance, sometimes more than the gross receipts for such a performance.

(8) The decline of "drawing-room" or "smart" comedy in favour of more serious drama and in favour of comedy-drama of middle-class and lower middle-class life. This meant the elimination of wit and subtlety in favour of broad farce or melodrama, but it also meant the elimination of the wise-crack and the cynical epigram upon which so many sophisticated comedies of the '20s and of previous decades, going back to the Yellow '90s and Oscar Wilde, were based, based so much, indeed, that often such comedies were, or seemed to be, built entirely around a few

clever lines. And when one uses the words clever here, one means the paradoxical or the surprising or simply an observation contrary to one's experience or to one's normal sentiments or emotions.

The British and U.S. theatres had become practically identical. That is, the plays produced with success in New York sooner or later reached the London stage and vice versa. The reception, in either case, was not always the same; a smash hit in New York might be a failure in London, and a play that had great success in London might be a complete failure in the United States. A British author might find his countrymen indifferent to his playwriting efforts and be a great success in America. On the other hand, a new American playwright such as Elsa Shelley could find a Pick-Up Girl (1944), pulled off the boards after a short and unprofitable run in New York, the season's (1946) hit in London, doing a larger gross business than any musical and playing the provinces with six road companies, all successful, with enthusiastic acclaim not only from the critics but from Queen Mary herself (who rarely volunteered a commendation for a play). Incidentally, the recommendation of the wife of a president of the United States, or even of the president himself, had never enhanced the commercial value of a play or a book, with one notable exception, Theodore Roosevelt's recommendation of Penrod by Booth Tarkington and of Edwin Arlington Robinson's merits as a poet, the latter recommendation serving to lift a fine poet out of obscurity; but Mrs. Franklin D. Roosevelt, for instance, often praised books and plays in her widely syndicated column with no appreciable demand therefrom at the bookstores or the box offices.

From 1937 to 1946 the drama was, in effect, dead in Germany, Italy, Spain, France, the Scandinavian countries, China, Japan and elsewhere in the world, except the United States, Great Britain and U.S.S.R. During World War II the drama flourished, commercially at least, in the United States in a way that it had never flourished before. Money was easy to get for productions in the United States, even with the enormous increase of production costs, because of war prosperity for workers, business men and gamblers alike. Because of income taxes, a person in the higher brackets of income could lose \$10,000 in an investment in a Broadway flop and still-because it was a legitimate deduction in his income tax report-sustain an actual loss of only \$1,000 or less; and if he hit the jackpot by investing in a highly successful play or musical, his income from a \$10,000 investment might pay (with his cut in movie rights) from 3,000% to 6,000%.

U.S. play costs, before the actual opening, rose during World War II to an average of \$70,000 for a legitimate play and to an average of \$200,000 for a musical. The same productions 25 years before might have cost less than \$5,000 for a straight play and less than \$25,000 for a musical. The gains were labour gains, mostly, and for that reason to be applauded, because the actors' and stage-hand unions, the musicians' unions and other combinations of workers, had been effective in equalizing the profits from a gamble among all who contributed to it: it did not let the profits go mainly to the real-estate men who controlled the theatres and to other middle-men in a theatrical production.

Pity the Author.—The only ones who suffered from this situation were the authors of plays which were not successful. These authors included many whose work was highly praised by the majority of drama critics and published in Burns Mantle's Best Plays of the Year (including British

Above: Scene from Oklahoma!, a musical comedy with scores by Richard Rodgers and choreography by Agnes de Mille. The production opened in 1943 and in 1946 it broke existing long-run records for U.S. musicals with more than 1,400 performances

Right: The Iceman Cometh marked the first new offering by Eugene O'Neill within the decade 1937-46. Concerned with man's need for illusions, it was greeted with controversial reviews but drew full houses after its premiere in 1946

Below: Margaret Sullavan and Elliott Nugent, stars of the Voice of the Turtle, an appealing comedy by John Van Druten which opened in 1943 and had a successful run

Laurette Taylor and Eddie Dowling in a scene from Tennessee Williams' prize-winning play *The Glass Menagerie*, judged by the New York Drama Critics Circle in April 1945 as the best play of the season

Left: Paul Robeson was the first Negro to play Shakespeare's Othello in the U.S. He is shown (left) with Uta Hagen as Desdemona, in the production which opened in 1942 and later went on tour

and translated plays as well as U.S. plays). Actors got salaries for rehearsals, tryouts and for a full week after a Broadway opening, even if the play was closed after one performance. Theatre owners got rent for 3 weeks, amounting to from \$9,000 to \$16,000, even if the theatre was occupied for only 1 night. All of those engaged in the sheer mechanics of a production were amply protected. The author of the play was the "patsy"—unless his play was a tremendous success.

A producer, for instance, without putting a cent of his own money into the production, might charge against production costs \$2,000 a week or more as his salary. He might add another \$1,000 a week as director, beginning with the first week of rehearsals. A play could last only 1 night in New York and yet pay the producer \$18,000 or more, the theatre owner from \$9,000 to \$16,000, the actors, mechanics, costume designers and everybody (except the author) a fair return upon their investment of time, money, experience and talent.

The author, however, received \$500 as an advance against royalties from the producer who was considering his play. This play might have taken the author three years to write. The producer might get into a jam trying to get persons to put up money to produce the show. Persons with money to invest in shows, "angels," sometimes wished to see the script before they invested. They might take the script with them to Maine or Bermuda, along with many other scripts, and lose their copies of it. The producer (who charged this to the author's agent, who, in turn, charged it to the author-as was right) provided the "angel" with another script. The "angel" might not read it but get his wife or secretary to read it. Or the office boy. The wife, secretary, office boy and the "angel" all were incipient playwrights. They had never tried to write a play but they knew just how a play should be written. They had suggestions. Usually these suggestions represented a dozen different plays, none of which the original author had in mind, and all of them stark plagiarisms of scenes and incidents and gags which these amateur drama critics had found pleasing to themselves in the shows for which they had been given free tickets.

The author's headaches would then begin. He would like to see his play produced, without having his orchid turned into a ragweed. He would sweat and compromise; his play would be produced. But the producer had imported a high-priced director from Hollywood with his own ideas about plays-and, under Equity rules, all actors must take the director's direction, no matter how they might differ with the director about how a scene should be played—and the leading lady (salary \$3,000 a week and a percentage of the gross) might decide that all the good lines given to a comedienne (salary only \$1,500 a week) must be killed. The producer would decide he couldn't lose his star, who had cost him so many telegrams and telephone calls and dinners at the Stork club with the star's adamant agent. So the show would go on. It would be bad; critics would squelch it; the audience would walk out on it in great numbers. It would be a flop. And the author's net income for his three year's work would be \$500, less 10% agency fees, \$225 in telephone and telegram charges and \$145 in dinner, railroad and hotel charges, plus taxes. He was lucky if he emerged with 47 cents, net. But, if he hit the jackpot with his play, he would find himself the object of solicitude by the treasury department, which would need all the details about the \$750,000 he made last year, out of which, when all taxes and agency legal fees were paid, he might (if lucky) emerge with \$45,000 (or \$15,000 a year for three years)—pretty good pay for a writer, even if not for a criminal or corporation lawyer, a political boss, a war contractor, a labour czar, a night club comedian, a stage-hand, a jazz musician, a movie pin-up girl, the head of an advertising agency or a theatrical producer.

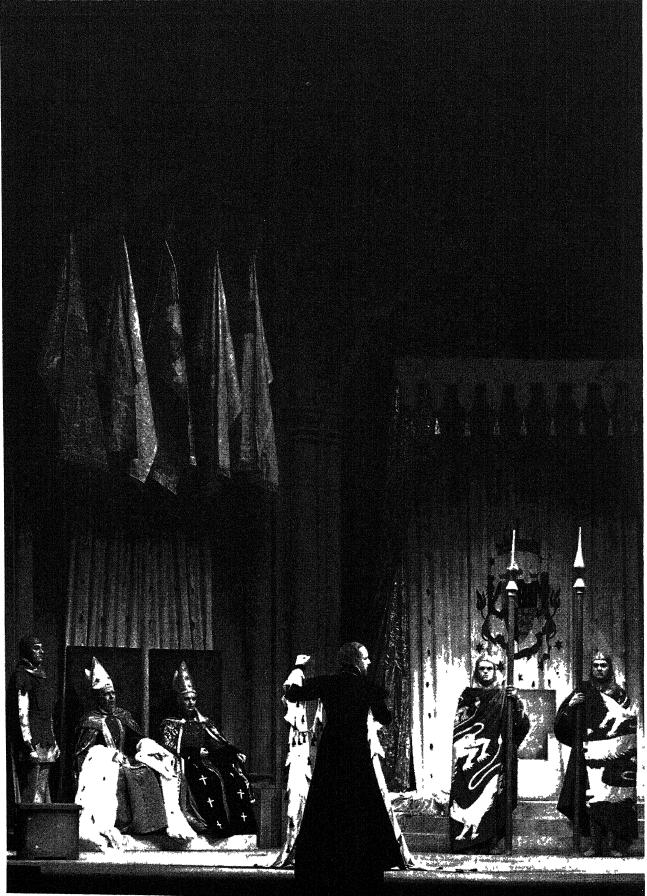

Plays and Dictatorships.—In U.S.S.R. they ordered these things differently. The system there was payment according to one's worth to the state as a whole. This was nice for authors, composers and other artists, for a while. The Politburo at first decided that playwrights, novelists, composers, painters were very important to the state—as propagandists—so such persons enjoyed for a while the highest incomes and the highest consideration that it was possible for anyone to receive in the U.S.S.R. except members in the highest councils of the Politburo. During World War II playwrights, novelists and composers—who were supposed to entertain the people—fared very luxuriously. War-torn Russia was a hotbed of feverish theatrical activity, more plays, new and old, being produced there than in all the rest of the world combined.

But in 1946 the Politburo of the U.S.S.R. decided that all the plays by western writers (that is, plays by U.S. and British writers, such as Wilde, Maugham, Behrman, Kaufman, Hart, etc.) which had been enjoying popularity in Russia were guilty of portraying "bourgeois ideology" and that popular plays by Russian writers were guilty of the same offense. The Politburo thereupon banned all plays except those which the Politburo should find acceptable to the Politburo, that is, all plays which did not idealize the aims and achievements of the current political leaders of the U.S.S.R. It would seem that soviet writers were not yet able to produce plays by fiat and that the drama was as dead in Russia as it was in Germany, Italy and Spain under the fascist-nazi regimes.

An examination of Annuraio del Teatro Italiano (Annual of the Italian Theatre) April 30, 1937—June 1, 1939, showed what a totalitarian dictatorship of culture could do to that culture. In that period there were 108 original plays produced in Italy, under the reign of Mussolini, and under the reign of Hitler, who dominated Mussolini and Italy from 1938 until the defeat of the axis.

It was the theory of Hitler and Mussolini that France was a decadent country, easily to be destroyed because its birthrate had been declining for more than a century, and that Germany and Italy would become more powerful if the subjects of these countries would produce more chil-

dren, *i.e.*, more "cannon fodder." Therefore both Germany and Italy offered bonuses to women who would produce children, in or out of wedlock. And their propaganda agents and official censors saw to it that no plays could be produced which did not glorify the German and Italian ideals in this as well as in all other respects. The results were 108 plays in Italy which were not only pornographic but sentimentally so—plays so repulsive to adult civilized minds that it was difficult to conceive of human beings in 20th century culture seeing them without ridicule or overt resentment.

In the United States there were many movies and radio "soap-operas" and even quite a few plays on a low intellectual level, and they were not ordered to be so written by the state; but, in this republic of (more or less) free enterprise, the highest level of theatrical productions were not represented—as it was in Italy and Germany—by claptrap. Rubbish was about all a country could expect when the politicians of a totalitarian state prescribed the sort of plays to be produced. (B. Ras.)

Great Britain

The most positive achievement of the English theatre during the years 1937–46 was a new standard of acting. So high was this standard at the period's close that it became almost a duty to believe in the dawn of a new golden age of English acting, comic as well as tragic. Contributions to serious drama were rare, and after World War II no new work of any significance appeared. The U.S.A., it would seem, had the dramatists; England the actors. However that may be, undoubtedly the most important thing that happened to the English theatre was that it was discovered by a great new public. Never at any time in its history had it meant so much to so many people; its appeal extended from London to the big cities, the towns and even the villages. It was the war which brought this new public into being.

Outside London before World War II there was constantly rumoured to be a widespread unsatisfied demand for drama. The evidence for it, unless collected with the eye of faith, was scanty and unconvincing. Amateur acting societies and playgoers' clubs might be numerous and active, but, to offset the hopes they inspired, famous provincial theatres continued to be turned into cinemas by a process that seemed automatic and irresistible; the half dozen well-known repertory theatres obviously depended on the efforts of a few brave spirits possessed of exceptional driving power and private means. Yet when London companies were driven into the country they found a surprising welcome; and for some years all things, good and bad, apparently conspired to advance the cause of the theatre from end to end of the country.

Government Help.—Even the government, with an air of doing good by inadvertence, took a hand. The Council for the Encouragement of Music and the Arts (later rechristened the Arts council), a body directly under the authority of the Board of Education, was originally formed by a few individuals in the autumn of 1939 to assist artists during the period of the nation's adjustment to war conditions by finding for them a useful part in the war effort. At the outset, drama and music were particularly hard hit, although their subsequent recovery was spectacular, and it was through the council's initiative that the government was prevailed upon to provide a grant in order that

Maurice Evans in the title role of Richard II. Evans' popular and critical success as a Shakespearean actor became widespread during World War II when his production of Hamlet, staged in relatively modern dress, played to enthusiastic audiences of U.S. servicemen and women overseas

the practice of these and other arts might continue. Thus aimed, the council enabled the Old Vic to form two touring companies of high quality which continuously played their way through the industrial areas, bringing Shakespeare and the classics before audiences to many of whom such things had hitherto been a sealed book. The council's support was later extended to many other theatrical ventures of genuine merit, and one frequent effect of its anomalous independence was that its acquisition of the 18th century Theatre Royal at Bristol provided the first recorded case of state purchase in the history of the English theatre. Thus by accident, as it were, the English drama was accorded official rank with the fine arts.

It is difficult to over-estimate the benefits which accrued to the theatre as a result of the assistance that it received during World War II from this curiously British organization which, under the astute and imaginative chairmanship of Lord John Keynes, continued to be a government hand doing things which the government's other hand knew nothing about. It was due to the Arts council that the Old Vic ramified into many permanent companies covering the country. It was with the support of the Arts council that the Old Vic's main company, led by Laurence Olivier and Ralph (later Sir Ralph) Richardson, was established at the end of the war in classical repertory in the heart of London. In the next few years it was to make acting history there, and there was general satisfaction when it was learned that the Old Vic company, already the strongest dramatic force in the country, was to become the nucleus of the National theatre whenever that almost fabulous project might become a reality of bricks and mortar. The skill and judgment of the Arts council in playing kindly providence was recognized when its original purposes had all been served. It was given a permanent place in the peacetime life of the country.

Discriminating Audience.—The new audience that had discovered this new theatre differed much in size and in requirements from the audience of tradition. Partly it was a listeners' audience, called into existence by the radio and the talking film, star-conscious no doubt but with a catholic taste born of its freedom from tradition and from the circumstance that only a very small proportion of it was within reach of the London theatre. Ivan Turgenev, William Congreve, G. B. Shaw, Henrik Ibsen, Michael Chekhov, all came alike to it, provided that the play was finely presented and finely acted by well-known actors. Outside London, in towns up and down the country, many and various plays of quality filled the theatres as they had not been filled since the actor-management times of Henry Irving, Herbert Tree or John Alexander. It became, during World War II, the rule rather than the exception that a London success of the better sort should be the culmination of weeks or even months of country touring. In London itself the audience of tradition remained fairly stable, and it was for this audience that the commercial syndicates continued to ply an honourable trade, supplying the musicals, the light comedies and the whimseys running for years on end. It was only after the war that this audience tended to monopolize the stage. Until a few years previous managers had been casting a shrewdly adventurous net over the centuries for plays likely to revive well, and they succeeded in revealing the singular richness of the English dramatic heritage. The wartime theatre had in truth little chance to be more than an heir, but in that role it must be allowed to have administered its noble estate with wisdom and imagination. The revival habit con-

tinued into peacetime, but, except where the Old Vic was concerned, neo-classics rather than classics were chosen and even the general public began to grow tired of the Edwardian scene.

Barren Dramatists.—The habit grew up in wartime, and there was no escaping it. If excuses could be made for the drying up of dramatic inspiration, plenty were at hand. Young British writers were born into a period highly discouraging to creative effort. In 1937 their plans may well have been unsettled by the growing sense that they were drifting between one catastrophe and another. Came the catastrophe, and the young were swept into the fighting lines. The survivors found themselves in a society which was harassed by drab uncertainties. Genius would doubtless have made light of such an atmosphere, but genius tailed to appear. It seemed to be absent in 1937. Then J. B. Priestley had three new plays running simultaneously -Time and the Conways, I Have Been Here Before and People at Sea. The first two, based on the time theories of Ouspensky and Dunne, were plays of quality. And James Bridie's Susannah and the Elders revealed a writer of considerable ability. But neither of these dramatists was wholly to realize the hopes they then raised. Both wrote a number of entertaining and successful plays during World War II, but Priestley seemed too intent on enheartening his fellow countrymen as often as possible to concentrate his great gifts; and Bridie's brilliant first acts invariably put to shame those that followed. They Came to a City was Priestley's most solid work, and Mr. Bolfry Bridie's most sustained. Most of the dramatic honours of war fell to Noel Coward with three plays-Blithe Spirit, an almost purely nonsensical intellectual farce, Present Laughter, a slightly sophisticated comedy, and This Happy Breed, a somewhat self-conscious excursion into the lesser suburbs. Bernard Shaw's Geneva and In Good King Charles's Golden Days were written just before the war, but so many of his plays were revived that he never ceased to be a major figure of the period. And after the war Somerset Maugham enjoyed an outstanding vogue. Peter Ustinov had few rivals among the talented young, and his comedy The Banbury Nose showed a more mature psychological insight than either of his previous pieces.

Inspired Actors.—It was natural under the circumstances that critics, whether of amateur or professional status, should have concerned themselves less with the play than with the manner of its presentation. The merits and shortcomings of John Gielgud's Lear, Hamlet and Macbeth and of Donald Wolfit's playing of the same parts were eagerly disputed and with the end of World War II Laurence Olivier's Lear and Sir Ralph Richardson's Falstaff were generally felt to have challenged comparison with the great Lears and Falstaffs of stage history. Indeed, by introducing Lear as a choleric humourist, made by the habit of tyranny the slave of his own abounding whims, Laurence Olivier may be said to have made a contribution to Shakespearian interpretation; at any rate, his version made the hitherto improbable act of the division of Lear's kingdom plausible and entertainingly playable. Alongside this Lear, Laurence Olivier placed a magnificent Richard III, an unforgettable Oedipus, a brilliant Hotspur, to say nothing of his Justice Shallow and his Mr. Puff. John Gielgud showed once more that as Hamlet he had no rival. Donald Wolfit's great feats of acting did not enjoy the same measure of acclaim, perhaps because he acted in a company which seldom satisfied the exacting standards of London production. The Old Vic had magnificent leaders, but it also had a

splendid team. Donald Wolfit was too often the sole attraction of his own stage. Yet it must be remembered that he and his chosen actors carried Shakespeare, Ben Jonson, John Ford and Ibsen all over the country, that they seized a London stage when theatrical life seemed near to extinction in 1940 and that they reappeared in easier times with an extensive repertory of high endeavour. Lear during these years proved to be his greatest part.

Besides these distinguished actors were many more who showed great promise, from whom should be singled out Alec Guinness and William Devlin. (A. V. Cm.)

Theosophy

The Theosophical society, proclaiming as its main tenets the spiritual reality of the one life and the fact that humanity is a universal brotherhood, had naturally to suffer considerable material reverses during the decade 1937 to 1946. The national society in Germany had already been disbanded in 1933; its numerical strength was somewhat small after secession of Dr. Rudolf Steiner in 1912. The last general secretary in Germany was Baron Egenolf Roeder von Diersburg, and in 1946 it was not known whether he was alive or dead. As the German invasion of Europe gradually proceeded, the national societies were forcibly disbanded by the nazis, and their buildings and libraries confiscated. The movement in the invaded countries went underground and members continued to meet in private almost everywhere. Elsewhere the society continued its activities without losing ground.

Dr. G. S. Arundale, president from 1934 onward, died in Aug. 1945 and was succeeded by C. Jinarajadasa, a Sinhalese and Buddhist, author and traveller.

With the ending of World War II came a great resurgence of life throughout the society. Many inquiries regarding its philosophy were being made, and new members joined in countries where there was political freedom. The largest individual groups were to be found in the United States, India and Great Britain. The national president of the society in the U.S. in 1946 was James S. Perkins, and the headquarters were at Wheaton, Ill. The designation of national president corresponds to that of general secretary in Great Britain. The total membership

of the society in England was 3,752 in 1946. The number of members was slightly higher in the U.S. and possibly about twice the number in India. (D. Gs.)

Thomas, Rolland Jay

Thomas (1900—), U.S. labour leader, was born June 9 in East Palestine, O. He completed high school and attended Wooster college (Wooster, O.) for two years. In 1923 he entered the automobile industry as a metal finisher and six years later emerged as a labour union leader at the Chrysler plant in Detroit. In 1934 he was chosen by his fellow workers on the first shop committee under the National Recovery act (N.R.A.); he was president of Chrysler Local No. 7, when it amalgamated with the United Automobile Workers (U.A.W.) in 1936. One of the militant leaders in the General Motors and Chrysler strikes of 1937, he was named one of the vice-presidents of the international union in that year.

In 1938 Thomas was elected president of the U.A.W. international union and vice-president of the Congress of Industrial Organizations (C.I.O.) in 1939. During World War II Thomas denounced wildcat strikes no matter what the provocation and adhered rigidly to the no-strike pledge.

Thomas and Walter Reuther were the leading union figures in the General Motors strike that started Nov. 21, 1945, and ended March 13, 1946. While the strike was still in progress, Thomas and Reuther disagreed. Reuther became a candidate for Thomas' post as president of the U.A.W. In the voting March 27, 1946, at the party convention in Atlantic City, N.J., Reuther was elected by a very narrow margin, but Thomas was elected first vice-president.

Thorez, Maurice

), French politician, was born April Thorez (1900-28 in Noyelles-Godault, a village in the department of Pasde-Calais. The son of a coal miner, he started work in the pits when he was 12 years old. After World War I he joined the Socialist party but left in 1920 to join the newlyformed French Communist party. A talented dialectician and a forceful leader, he rose high in the party ranks and in 1930 became secretary general of the Communist party in France. Two years later he was elected to the chamber of deputies from Ivry-sur-Seine, a suburb in Paris' "Red Belt." In 1936 Thorez rallied the Communist deputies to support Léon Blum's first popular front government. At the outbreak of World War II, Thorez was conscripted into the French army, but soon disappeared. Court-martialled in absentia, he was convicted of desertion and sentenced to serve six years' imprisonment. In 1943 it was disclosed that he was living in Moscow. That year, Thorez's appeal to be permitted to return to liberated French territory was denied by Gen. Charles de Gaulle, but in Nov. 1944 after his election, also *in absentia*, to the consultative assembly in Paris, he was amnestied under a general order pardoning French deserters who had engaged in resistance movements.

He returned to Paris on Nov. 28, 1944.

On resuming the leadership of the Communist party, Thorez followed a restrained policy. While he continued to attack the postwar remnants of the "200 families" which leftists said were the real rulers of prewar France, he agreed to three-party rule of France with the middle-of-the-road Socialists and the conservatively-inclined Popular Republican movement (M.R.P.).

Thorez made three bids for the presidency and premiership of France in 1945 and 1946, all of which failed because the Communist party, although the strongest single party in France, could not muster enough votes in the assembly to support a government of its choosing.

Tibet

A country of central Asia, Tibet lies north of the Himalayas and south of the Kun-lun mountains; mainly a high tableland. Nominally a Chinese dependency, it is in practice independent. Area: c. 463,200 sq.mi.; pop.: 1936 est. 3,722,000. Capital: Lhasa (pop. c. 50,000). Religion: Lamaism.

Ruler: 14th dalai lama, Lingerh Lamutanchu (born 1933, enthroned Feb. 22, 1940).

On the death of the 13th dalai lama on Dec. 7, 1933, the administration of Tibet was taken over by Reting Hutukhtu until, according to Tibetan tradition, the spirit of the deceased lama should be found reincarnated in one of its people. In 1938 Reting Hutukhtu reported the rebirth of the spirit of the dalai lama in the person of a

Portrait of Lingerh Lamutanchu, a Chinese boy, who was enthroned 14th dalai lama of Tibet in 1940. He was born in Dec. 1933

child found in Chinghai, whereupon the Chinese government appointed Wu Chung-hsin, chairman of the commission on Mongolian and Tibetan affairs, to assist Reting Hutukhtu in taking charge of the affairs concerning the rebirth of the dalai lama. A special envoy escorted the child from Sining to Lhasa, and on Feb. 22, 1940, the solemn ceremony of enthronement took place. Reting Hutukhtu was instructed by the Chinese government to continue the administration of Tibet until the dalai lama came of age.

The panchan lama, the religious head of the Tibetan state, who since 1924 had been travelling in the interior provinces of China, died on Nov. 30, 1937, on his way home to his country. The Chinese government, in recognition of his services to Tibetan-Chinese relations, conferred on him the posthumous title of "Hui Kuo Hsuan Hua Kwang Hui Yuan Chuch Ta Shih" and his remains were given an official escort back to Tibet. Panchan Chasa-ro-sang-chien-tsan was appointed to seek for the reincarnation of the panchan lama. His mission was successful, and on Feb. 8, 1944, the 10th panchan lama was enthroned. The ceremony was presided over by members of the Kuomintang's central executive committee.

The standard of living of Tibet was very low at the best of times, and during the decade 1937–46 was reduced by famine, and in the autumn of 1942 by plague in the Huangyuan region in Chinghai. The Chinese government sent relief on many occasions. Tibet for its part gave aid to China during the war, sending clothes, furs and wool, and in 1940 a comfort mission went to Chungking where it presented a banner to Generalissimo Chiang Kai-shek and a money gift for Chinese troops.

Tibetans held office in the central government of China and more frequent exchanges of visits between Tibet and China contributed to a closer feeling of unity than existed before. A delegation of 20 lamaists visiting Chiang Kai-shek on his assumption of the presidency of China asked that he help Tibet to develop politically, economically and culturally. China's policy, as stated by Chiang in 1945, was to allow Tibet a higher degree of autonomy.

Tien, Thomas

Cardinal Tien (1890—), Chinese Catholic prelate, was born Sept. 27 at Changtsiu, China. Orphaned in his childhood, he was taken into the Society of the Divine Word orphanage of Puoli, run by Catholic missionaries, in Shantung. He completed his studies in both the minor and major seminaries operated by the society in Yenchowfu. After his ordination in 1918, he taught at mission schools until 1921 and was then assigned to various missions in Shantung.

Entering the Divine Word novitiate in 1929, he took his final vows in 1934. Consecrated vicar apostolic of Yang-kü by Pope Pius XII, Msgr. Tien was named titular bishop of Ruspe and vicar apostolic of Tsingtao in 1942. His appointment to the Sacred College of Cardinals was announced, Dec. 23, 1945, and he was proclaimed a cardinal at ceremonies in Vatican City, Feb. 18, 1946.

Timor

See PORTUGAL; PORTUGUESE COLONIAL EMPIRE; WORLD WAR II.

Timoshenko, Semyon Konstantinovich

Timoshenko (1895–), soviet army officer, was born Feb. 18 in Furmanka, Bessarabia. The son of impoverished peasants, he had virtually no formal education and was working as a farm labourer when he was inducted in the tsarist army in 1915. He fought in the Don region against the Whites and became commander of the 6th Red cavalry division.

After the civil war, Timoshenko joined a Red army military academy to acquire the formal schooling that he had missed in his youth. On completing his studies he was made joint commander and commissar of the 3rd cavalry corps in 1925. He was assistant commander of the Kiev military district at the outbreak of World War II in Sept. 1939.

During the Russo-Finnish war, Stalin assigned Timoshenko to command the Karelian front in Dec. 1939. Timoshenko spent the entire month of Jan. 1940 preparing for a break-through of the Mannerheim line; he opened his offensive Feb. 1, 1940, and within a month his forces had broken through the fortress chain to reach the outskirts of Viipuri (Viborg).

Timoshenko was appointed people's defense commissar and was raised to the rank of a marshal May 8, 1940. When the Germans launched their invasion of the soviet union, June 22, 1941, he was in command of the central group of Red armies blocking the route to Moscow. On Oct. 23, 1941, Timoshenko was shifted to the southern front, where he launched a surprise attack against extended German lines and recaptured Rostov, Nov. 29, 1941.

The following summer, when German armies had broken through soviet lines in the Ukraine and were racing toward Stalingrad, Timoshenko conducted a rapid but orderly retreat from Rostov and Novocherkassk. Later he was transferred to the Ilmen-Leningrad front, where he launched offensive operations around Lake Ilmen.

In the summer of the year 1943 he was returned to the southern front and led the concentrated Russian drive that resulted in the final recapture of the Taman peninsula in October.

Tin

Data on world production of tin were still lacking for many countries, mostly those occupied by axis troops, after World War II.

Mine production, as compiled and estimated by the U.S. bureau of mines, is shown in Table I.

Since two-thirds of the prewar tin output originated in countries that were occupied by Japanese troops, the tin industry of the world was recast during World War II, especially the supplies of the United Nations, which had been only partially offset by increased production in countries still accessible. After the loss of the oriental smelting capacity, a tin smelter was built in the United States, making that country the largest smelter of tin in the world during the war years. Smelters of the United States, Great Britain and the Belgian Congo handled about two-thirds of the known ore supply in the latter years of World War II, while minor outputs from Australia, Canada, China, Mexico and South Africa increased the United Nations supply to nearly three-quarters of the world total. However, the total had shrunk so much below its normal level

that the available supply was far less than normal, and stringent controls were necessary to restrict consumption to essential uses. To compensate as much as possible for the loss of the major oriental sources, output was expanded elsewhere, especially in Belgian Congo, Bolivia and Nigeria; in 1939 these 3 countries supplied only 26% of the world total, rising to 54% in 1942 and 82% in 1945.

After the fall of Japan and the reoccupation of the major producing centres in Malaya, Netherlands Indies and Burma, and the expulsion of the Japanese

from Siam and Indo-China, small tonnages of Japaneseproduced tin were seized and exported to replenish dwindling stocks. The conditions reported in the producing areas, however, were such as to indicate a lapse of at least two years before production could be much improved. Production during the first half of 1946 showed only a very slight improvement over that of 1945.

Widespread readjustments were required. As the occupied areas came back into production their output could be absorbed for a time in expanding consumption above the restricted wartime level, but eventually the time would come when supply would outrun demand, and production would have to be adjusted between these countries and those in which production had been pushed above normal levels by the demands of World War II. Then, too, there was the question as to whether the postwar consumption rate would be as high as the prewar rate; during the years of forced economy many uses, in which tin was formerly thought to be essential, were drastically rationed, or even eliminated entirely. It was quite possible that users in some lines of consumption had discovered that they could get by with less tin than they had formerly thought necessary. Finally, there was the problem of the disposal of the Texas smelter; this plant would continue as essential until smelting capacity in the orient and the Netherlands was sufficiently rehabilitated to handle the normal ore supply. However, the question would then have to be settled as to whether the Texas plant was to be dismantled, held in a stand-by condition or kept in operation in competition with other world smelting capacity. This problem had so many features which seriously impinged on the return to normal living in other smelting centres that it would probably become the subject of international negotiations.

The United States had long been the world's largest consumer of tin, though domestic production remained practically nil. Demand and a price up to double the normal during World War I brought a domestic output of only 157 short tons in 1916 and a total of 588 tons in 1914-18. Although agitation for the production of strategic metals led to a peak output of 189 tons in 1937, domestic production was abandoned as hopeless, and the combined total for 1942-44 was only 19 tons, with none reported in 1945. Practically the entire domestic demand had been supplied in normal years by imports of metal, but with the loss of the oriental smelters through Japanese occupation, and with the shortage of shipping to carry Bolivian ores to

English smelters and then back to the United States, it became necessary to establish a domestic smelting industry. There was a small metal output from private smelters, beginning in 1940, but it was not until the government-owned plant near Galveston, Tex., went into operation in April 1942 that domestic smelting was able to carry any appreciable load. Later, 64% of the available metal supply was furnished by domestic smelters, against 36% by imports, and in 1945 the proportion rose to 83%.

Domestic smelting was established in the United States by private plants on a small scale during World War I, but after the close of that war they were not able to secure ore supplies and were forced to close down. All of the British empire ore output was produced under export restrictions, and the bulk of the Bolivian output was under contract to English smelters, and it was only as a necessary war measure that readjustments were made to provide an ore supply for the Texas smelter. As conditions were brought back to normal there would doubtless be a resumption of restrictions on the export of ore, and it was questionable whether domestic smelting could be continued except after international negotiation and agreement as to the extent that smelting in the United States might be permitted to encroach on the old established smelting interests. Commercially, these interests had the upper hand, but for security reasons it was desirable to have the smelting industry continued in the United States.

With the discontinuance of price control, in Nov. 1946, the price of tin in the United States advanced to 70 cents per pound. as compared with the controlled price of 52 cents. (See also Metallurgy; Mineral and Metal Production and Prices.) (G. A. Ro.)

Tires

See RUBBER.

Tiso, Josef

Tiso (1887–1947), Slovakian politician and ecclesiast, was ordained a Roman Catholic priest in 1909; he joined the Slovak autonomy movement after the end of World War I and associated himself with Father Andreus Hlinka's movement.

Following the Munich pact in Oct 1938, Czechoslovakia

granted the Slovaks their long-desired autonomy and Tiso became prime minister of the Slovak state. Suddenly ousted from his post by the Czechoslovak government on March 10, 1939, Tiso appealed to Adolf Hitler for assistance. Four days later, Slovakia, with German backing, proclaimed its independence. Reinstated as prime minister, Tiso signed a pact with Hitler on March 23, 1939, under which Germany guaranteed Slovakia's political integrity for 25 years. At that time, Hungarian forces were invading eastern Slovakia. On Aug. 18, 1939, Germany assumed military control over Slovakia and Tiso was elected first president of the Slovak republic Oct. 26, 1939.

Hostility to Tiso's rule by Czechs and left-wing Slovak elements was heightened by the Slovak premier's anti-Semitic measures and his dispatch of the Slovak army to help the Germans crush the partisan uprising in 1944 in which thousands of patriots were killed. After the collapse of Germany, he was captured by U.S. 3rd army troops.

At the opening session (Dec. 2, 1946), of his trial in Bratislava, Tiso challenged the authority of the court and the impartiality of the presiding judge, Dr. Igor Daxner. Both protests were overruled. Tiso was condemned to death and hanged April 18, 1947.

Titanium

Of the two commercial ores of titanium, ilmenite and rutile, the former continued to supply the bulk of demand, but the latter had some uses for which ilmenite was not suitable. World production of rutile prior to World War II was only of the order of 5,000 tons a year, and even the top war demand brought out not more than 20,000–25,000 tons. Australia remained the chief producer, followed by the United States, Brazil and French Cameroun. Ilmenite output, on the other hand, totalled about 320,000 tons in 1937, after a more than 10-fold increase in 20 years resulting from the expanding demand for titanium pigments—two-thirds from India and most of the remainder from Norway; the United States was the third largest producer. The output of the leading producers was as follows in short tons:

						Ta	ble	I.—Produ	ction of Ilm	enite

When transportation conditions made it impossible to move the Indian output to the United States, production in India declined and that of the United States was developed to cover the shortage. No reports were received on Indian output after 1943, when it had dropped to under 42,000 tons, but improvement was evidenced by U.S. imports of 62,066 tons of Indian origin in 1944 and 179,693 tons in 1945. The Norwegian output declined about a third from the prewar level, while Canada developed a temporary production almost equal to the Norwegian. War demand led to increased outputs by a number of minor producers, chiefly Australia and Brazil, while shipping difficulties reduced output in Senegal.

The United States was slow in supplying increased demand for titanium pigments from domestic sources and made no great advances in domestic ilmenite production until war transportation difficulties cut off imports, most of which had come from India. Output was expanded beginning in 1942, and by 1945 was well above the prewar level of consumption. In the meantime, however, demand

had continued to increase, and as soon as shipping conditions permitted, imports came back almost to the prewar level. All told, the supply in 1945 was more than double that of 1940. The salient statistics of the industry in the United States are shown in Table II.

		š š			7,813
Alloys and carbid	··· •	*	709	5,221	1,923
Stocks		ę	5,678	6,173	10,130

In the first half of 1946, the production of ilmenite dropped to 139,179 tons, but imports soared to 209,690 tons, or almost as much as in the full year 1945. Consumption rose slightly to 199,430 tons, leaving a considerable balance for stocks, which increased to 397,430 tons. Rutile production dropped to 2,840 tons and imports to 2,759 tons; consumption declined 2,994 tons, with stocks increasing to 12,643 tons.

Although much of the titanium pigment went into war uses, the most important contribution of titanium to direct war uses was in welding rod coatings and in titanium alloys and carbides.

(G. A. Ro.)

Tito

Tito (Josip Brozovich or Broz) (1892—), Yugoslav army officer and statesman, was born near Zagreb in Croatia. He served in the Austro-Hungarian armies during World War I and in 1915 went over to the Russians. Returning to Croatia after the war, he became a labour leader and Communist, assuming the pseudonym Tito. After the Germans overran Yugoslavia in 1941, Tito organized a leftist guerrilla group, which effectively harried axis occupation forces. Subsequently, Tito engaged in a struggle for power with Gen. Draja Mikhailovitch, who had organized a similar guerrilla organization but with rightist leanings. Tito, whose armies were numerically larger and had more mass support, emerged from this internecine battle victorious and won Allied recognition.

On March 7, 1945, Tito formed a new Yugoslav government with himself as premier. On May 2, after the surrender of German armies in northern Italy, his partisans occupied Trieste, slightly ahead of British imperial forces also trying to seize the port. Tito's unilateral seizure was denounced by the Allies and on June 9 he reluctantly agreed to turn over command of the military government of Trieste to the Allies and to withdraw his troops to Gorizia. Tito's government held national elections on Nov. 11, 1945, although the political opposition stayed away from the polls. However, the Yugoslav electorate endorsed his policies and on Nov. 29 he proclaimed the dissolution of the monarchy and establishment of a republic. His government was recognized by the United States and Great Britain on Dec. 22, 1945.

In 1946 Tito renewed his claims to Trieste and charged that the Allied military government was encouraging infiltration of Italian "Fascist bandits" into Trieste. In the early part of the year, he made visits to Prague, Czechoslovakia, Warsaw, Poland, and Tirana, Albania, and in the summer of 1946 he visited Moscow, securing a pact

Tito's portrait on a German notice offering 100,000 marks for the capture of the Yugoslav partisan leader, dead or alive, which appeared in the Belgrade Novo Vreme July 21, 1943

(June 8) whereby the soviet union agreed to help rebuild Yugoslavia's industries and equip its army. In Aug. he became embroiled in a serious controversy with the United States over the shooting down of U.S. planes over Yugoslavia. On Aug. 21 the United States delivered a warning to Yugoslavia to free the occupants of one of the craft shot down, failing which the state department would take the case before the United Nations Security council. Although he complied with the U.S. ultimatum for "satisfaction" and subsequently paid a \$150,000 indemnity for the deaths of five fliers, Tito maintained that infringement of Yugoslav frontiers by the U.S. planes was "deliberate."

Titulescu, Nicolae

Titulescu (1883–1941), Rumanian diplomat and statesman, was born in Craiova, the son of a prominent Rumanian jurist. Educated in Craiova and Paris, he became professor of law at the universities of Jassy and Bucharest. Titulescu entered Rumanian politics in 1912 and 5 years later, at the age of 34, he was appointed minister of finance. In 1927 Titulescu became foreign minister in the

Vintila Bratianu government. Under his tutelage Rumania championed collective security, entered both the Balkan and Little Ententes and embarked on a policy of friendship with France and the U.S.S.R. His support of a pro-French policy was so militant that his political enemies called him "foreign minister-at-large of France." Titulescu's power waned with the rise of Adolf Hitler's Germany. His countrymen had lost all faith in collective security, and Titulescu was dropped from the cabinet in Sept. 1936 while he was in France. As Rumanian Fascists had openly threatened to kill him, the former foreign minister was lorced to remain abroad. In 1937 he returned to Rumania, but fled again to France in 1940. He died at Cannes on March 17, 1941.

Tobacco

The place of tobacco in U.S. farm economy underwent a remarkable change during the decade 1937-46. Before World War II, tobacco was not considered an essential crop; even in the first years of the war in Europe it was not highly regarded in comparison with food crops. But by 1944 it began to hold high rank as a wartime commodity and an essential to the maintenance of morale. Consumption increased rapidly and production rose to new record heights in 1944, 1945 and 1946. When the war began, no other group of U.S. farmers was in more serious jeopardy than the growers of flue-cured and dark tobacco. More than half of these types had been exported, and the war put a sudden end to this market. Supplies of tobacco had been large for six years. Production reached a high level in 1930, and stocks reached a peak in 1932. By 1937 exports had not reached the predepression level of 1928 and 1929. Prices had declined to the lowest point in 20 years in 1931 but had recovered somewhat by 1934. The growers' income was slowly recovering and favoured some expansion of planting.

Tobacco acreage in 1937 was 1,752,800 ac., the highest for 6 years; in 1939, acreage increased to 1,999,900 ac., a record until that year except for the year 1931. The acreage then dropped to 1,305,900 ac. in 1941, followed by expansion to more than 1,900,000 ac. in 1946, almost as high as in 1939. The total acreage was less significant than that of particular types of tobacco. The remarkable increase in yield was more a factor in attaining the high production. In five of the seven years beginning with 1940 the yield per ac. was more than 1,000 lb., compared with a 10-year (1935–44) average of 952 lb. The record was made in 1944 at 1,117 lb. per ac.

Total tobacco production was high in 1937 and still higher in 1939 at 1,880,793,000 lb.—the record up to that time. Four smaller crops followed, but in 1944 a new high mark, 1,950,000,000 lb., was made which was exceeded in 1945 with 1,997,000,000 lb. and 1946 with 2,162,900,000 lb. (Aug. estimate).

Upon the outbreak of war in 1939 the British buyers, who usually took about one-third of the flue-cured crop, ceased buying. Markets were closed to prevent a collapse of prices, which were down to about 15 cents compared to 22 cents for the 1938 crop.

The U.S. government held a referendum of growers on marketing quotas and agreed to finance the grades usually taken by the British trade. A purchase and loan program supported prices for the rest of the year. The large crop of 1939 increased stocks, and exports declined. Flue-cured stocks were particularly large, and Burley supplies were high. Marketing quotas were again voted in 1940, and

*Preliminary estimate.

the loan and purchase program was continued. The foreign market for fire-cured types, 60% of which had been exported, began to decline. The outlook was so gloomy that acreage for 1941 was reduced by 600,000 ac. from the high of 1939. Prices in 1940 averaged only 16 cents per lb. national average. The law was amended to provide for marketing quotas for three years, and 86% of growers voted in favour of such quotas for 1941-43. In 1941 the law was broadened to apply to more types of tobacco, and the parity base was changed from 1919-29 to 1934-38. In May loans at 85% of parity were offered to producers of all types of tobacco who co-operated with the Agricultural Adjustment administration. Free inspection service was provided in one-third of all auction markets in 1941. The average growers' price was 26.4 cents per lb. in 1941 compared to 16 cents a year earlier. In 1942 the price advanced to 36.9 cents per lb. average.

By 1943, tobacco had come to be regarded as essential to the war effort. Cigarette manufacture increased more than 50% over that of 1940, to new high record levels. Both military and war-worker demand contributed to this expansion. The foreign demand also increased. Lendlease took large quantities for export, about 87% to Great Britain. The use of tobacco by-products to replace the shortages of insecticides and fungicides increased. Large quantities of nicotine sulphate were made and sold under a price ceiling with subsidies for by-product manufacturers to cover the difference between the price paid for the leaf and the price at which the product had to be sold.

Changes in the consumer demand for tobacco developed rapidly during the war period. Cigarette consumption increased rapidly to about three-fourths of the total of tobacco consumed. Chewing tobacco and snuff consumption increased because of the restrictions on smoking in the military forces and in war plants. On the contrary, the use of cigars and smoking tobacco declined. The demand for most types of tobacco exceeded the supply in 1943 and price ceilings were placed on most types of

The War Food administration allocated supplies of the 1943 crop to buyers to divide stocks equitably. The Combined Food board made international allotments. The large British requirements were supplied by the Commodity Credit corporation; two-thirds was sold for cash and one-third was shipped under lend-lease for military forces. By 1945 tobacco had become a war crop of which a very large proportion went to the military forces. Civilian cigarettes became scarce, even with the record production, which was more than 50% above the 1935-39 average. During 1944-45 cigarettes accounted for about 80% of the total volume of tobacco products, an increase of 7%; production of smoking tobacco increased 17%, and production of cigars also increased. About 30% of the cigarettes made were exported. The per capita consumption of cigarettes was estimated at 1,262 in 1937 and 1,889 in 1943.

The cigarette shortage became so acute in the United States that investigations were conducted which found that the situation was due to: (1) limi-

tations of manufacture caused by labour shortage; (2) large military demands which were met before supplying civilians and (3) the increase of smoking by civilians with higher incomes. The lack of leaf was not a limiting factor. With the end of hostilities the military demand declined and civilian supplies became ample. The large crops of tobacco assured plenty. The termination of lend-lease put exports on a sale basis. During the war years the CCC handled about 1,700,000,000 lb. of tobacco, mostly for the military forces, and about half shipped under lend-lease. Foreign demand was expected to continue at a high level until stocks abroad were restored and foreign production recovered.

The world tobacco crop was estimated at an average of 6,560,000,000 lb. during 1935-39 and at 5,306,000,000 lb. 1940-44. The principal decline was in Europe and Asia. By 1945 the total was up to 6,027,000,000 lb. because of increases in the United States and South America and a small recovery in Asia. The early estimates for 1946 put the world crop at 6,654,000,000 lb., larger than the prewar average, mostly in the western hemisphere. The world's big tobacco producers in 1945 were the United States, 1,997,000,000 lb.; India, 1,050,000,000 lb.; China, 902,000,-000 lb.; Brazil, 240,000,000 lb.; Turkey, 145,500,000 lb., all other countries producing less than 100,000,000 lb. Burma, Japan and Java produced about 100,000,000 lb. each before World War II but lost production steadily during the war. Great Britain, Europe and the soviet union greatly increased consumption during the war but produced relatively little tobacco leaf. Canada produced. 72,093,000 lb. of tobacco in 1937 and increased the crop to an average of 84,484,000 lb. during 1940-44. In 1945 more than 92,000,000 lb. were raised, and a new high record of 115,000,000 lb. was estimated for 1946. The Cuban crop was much less than that of Canada—55,000,000 lb. in 1937 and an average of 53,154,000 lb. during 1940-44, with a top of 60,000,000 lb. in 1946. Mexico grew a crop slightly larger than that of Cuba, reaching 70,000,000 lb. in 1946.

Production by Types.-Flue-cured tobacco amounted to more than half the total U.S. crop in 1937 and was about twice the quantity of air-cured Burley. Production jumped from about 866,300,000 lb. in 1937 to 1,275,000,000 lb. in 1939, then declined for 4 years, after which came the 3 big crops of 1944-46. The price dropped from about 22 cents per lb. in 1937 to 15 cents in 1939 and 16 cents in 1940. It then jumped to 38 cents in 1942 and made slight gains to more than 40 cents, where it held through 1946. The total supply of this type of tobacco was more than 2,000,000,000 lb. from 1939 on, stocks being only about one-fourth larger than production.

The average price for the 1945 crop was 43.3 cents per

Ib., the highest since 1919, when the average was 44.4 cents per lb. Growers voted to continue acreage controls and marketing allotments through 1949–50. The British loan was expected to be a factor in sustaining the export trade. With continuing high consumption of cigarettes, the domestic disappearance of cigarette types of tobacco seemed likely to continue high. U.S. exports of flue-cured tobacco were at the low point in 1940, then recovered in 1941 and 1942. By 1944 exports were above the level of 1937 and 1938 and then made a new high in 1945.

The U.S. Burley tobacco crop was high in 1937, 402,-200,000 lb., and did not exceed this amount until 1944, when the output jumped to 591,800,000 lb. and then held close to that amount through 1945 and 1946. The large crops of 1944 built up the supply from 974,000,000 lb. in 1937 to 1,334,300,000 lb. in 1945. Consumption was high, however, and promised to reduce the stocks. The average price of Burley rose from 16.2 cents per lb. in 1940 to 45.6 cents in 1943 and then declined a little through the next two years. The tobacco goals for 1946 did not call for any increase in Burley acreage. The large domestic consumption would probably reduce the stock to normal if the 1946 crop could be moved. The 1946 yield of Burley was highest in Virginia, 1,450 lb. per ac., and North Carolina, 1,350 lb., compared with an average of 937 lb. in 1935-44 for the whole Burley belt.

Fire-cured tobacco had begun to decline in importance before 1937, when the crop was 119,000,000 lb. The decline continued irregularly until 1945, when the crop was only 57,095,000 lb., the smallest on record in 30 years. In 1946 the crop increased to 87,700,000 lb. Prices advanced after 1941, when it was 9.5 cents per lb., to more than 24 cents in 1945. Stocks were low through the decade after 1937. The smallness of the supplies held down exports.

All of the fire-cured tobacco came from Kentucky, Tennessee and Virginia.

Dark air-cured had changed little in supply from 1926 to 1937. The crop was 48,000,000 lb. in 1937 and dropped to a low of 30,000,000 lb. in 1943, then rose again to 47,275,000 lb. in 1946. This type of tobacco was largely used in chewing tobacco and declined with the decreasing use of this form of tobacco. Exports continued small. The price rose from an annual average of 7.3 cents per lb. in 1939 to 27.3 cents in 1943. Stocks were stable within a range of 56,000,000 to 74,000,000 lb. during the whole decade. This type was still mostly grown in Kentucky, except about one-fifth from Tennessee, Indiana and Virginia.

Cigar types of tobacco amounted to 105,000,000 lb. in 1937, increased to 139,000,000 lb. in 1939, then declined slightly until 1946, when the total reached a new high of 143,378,000 lb. The cigar filler types of Pennsylvania and Ohio ranged from around 55,720,000 lb. in 1937 down to 50,000,000 lb. and then up to 59,540,000 lb. in 1946. Cigar binder types followed a similar swing—a decline after 1939 and a great increase to 72,000,000 lb. in 1946. Cigar wrapper, shade-grown types, continued with less fluctuation throughout the decade, from an average of 8,800,000 lb. during 1933–42 to 11,800,000 lb. in 1946. All of the foregoing types reflected the decline in demand for cigars during World War II.

As shipping became available, the normal U.S. export demand caused an increase in exports toward the prewar level. In 1939 the United States exported a record amount of 473,757,000 lb. of all tobacco types; it imported 76,085,000 lb., giving net exports of 397,672,000 lb. Imports changed little until 1945, while exports increased from a

low level of 179,626,000 lb. in 1940, leaving a net export of about 300,000,000 lb.

The principal destinations of exports in 1946 were Great Britain, China, Australia, New Zealand, France, the Netherlands, Norway, Sweden and India. These exports represented chiefly the movement of stocks owned by foreign buyers to storage abroad to replenish stocks. The high price of U.S. tobacco was expected to stimulate the expansion of foreign production wherever possible.

Togo, Shigenori

Togo (1882-), Japanese statesman, was born in Kagoshima, Japan. He was graduated in 1908 from the Tokyo Imperial university, where he specialized in law; he entered the foreign service four years later. After holding a number of minor diplomatic posts in Europe and Asia, 1912-20, he became chief of the first section of the European and U.S. bureau of the foreign office in 1921. Later Togo headed the European and Asiatic affairs bureaus of the foreign office. He was ambassador to Berlin, 1937, and to the U.S.S.R., 1938. During his tenure as envoy to the soviet union, he helped negotiate agreements for settling the Soviet-Japanese fighting along the Manchurian border. Togo, who became foreign minister in Gen. Hideki Tojo's cabinet on Oct. 17, 1941, rejected as "fantastic" a U.S. proposal for settling the far eastern crisis, and reaffirmed Japan's determination to proceed with its expansionist program for establishing a "new order" in Asia. A week later, Japan attacked Pearl Harbor, bringing the United States into World War II.

Togo went out with the Tojo cabinet on July 18, 1944, but in the following year he returned as foreign minister in Baron Kantaro Suzuki's cabinet (April 1945). The Suzuki cabinet retired in turn after the emperor's surrender broadcast of Aug. 15, 1945. Togo was subsequently arrested by Allied authorities and was among the 28 Japanese leaders indicted April 29, 1946, in Tokyo by the Allied War Crimes tribunal.

Tojo, Hideki

Tojo (1884—), Japanese army officer and politician, was born in Tokyo of a samurai family. He attended the Imperial Military academy in Tokyo and upon graduation became a sublieutenant in the army. Later he was graduated from the Military Staff college (1915). After the close of World War I, he served for a while as military attaché in Japan's embassy in Berlin; returning to Japan he became an instructor in the Military Staff college and subsequently filled a number of important war office posts.

In 1928 Tojo was made commander of the 1st infantry regiment, which, eight years later, participated in the mutiny of the Tokyo garrison. In 1937 Tojo was appointed commander of gendarmerie headquarters, and shortly thereafter he became chief of staff of the Kwantung

army in Feb. 1937. He returned to Tokyo in 1938 to become vice-minister for war. Two years later (July 1940) he was appointed minister of war in the Konoye cabinet. Tojo succeeded Konoye as premier in Oct. 1941 and also assumed the war ministry and home production portfolios. On taking office, he pledged his government's firm adherence to its pro-axis and "greater east Asia" policy. Six days after the Pearl Harbor attack, Tojo declared that Japan was "fighting in self-defense and in the cause of righteousness."

Allied military successes in the Pacific in late 1942 and early 1943 caused consternation in Tokyo, and in Feb. 1943 Tojo assumed dictatorial powers over the nation's economy and political life in an effort to bolster home front morale.

He reshuffled his cabinet frequently in 1943, adding the portfolios of education, commerce and industry to those already under his control.

Further U.S. military successes in the Marshalls and in New Guinea, and the U.S. naval bombardment of Truk in early 1944 generated dissatisfaction with the rule of Tojo, who nevertheless assumed additional posts in February, becoming chief of the army general staff, minister of munitions and governor of the Imperial Rule association.

However, the successful Allied invasion of the Marianas Islands in June 1944 destroyed what remnants of confidence existed in his leadership and on July 16, 1944, he was removed as chief of staff and two days later (July 18) his entire cabinet resigned.

On Sept. 11, 1945, after Japan's formal surrender to the Allies, Tojo shot himself in a dramatic attempt at suicide. He was nursed back to health, however, and on April 29, 1946, along with 27 other Japanese leaders, was indicted by the Allied Military tribunal on 55 counts as a war criminal.

Books being returned to the shelves of the Ueno Imperial library in Tokyo. They were brought back in 1946 from small towns where they had been stored for safekeeping during World War II

Tokyo

The heart of Tokyo, capital of Japan and the world's third largest city (pop. 1940, 6,778,804) is situated in the sprawling, wood, paper and glass buildings that are the abode of the nation's spiritual and temporal leader, the emperor.

Facing the massive stone walls, gates and moat surrounding the imperial palace, many of Tokyo's citizens gathered in mid-1937 to bow in awe toward the palace and to pray for victory in the undeclared war which the emperor's forces had begun to wage in north China.

Exultant thousands paraded the streets and saluted Emperor Hirohito once again in Dec. 1941 when the government, now securely in the hands of Japan's lanatical militarists, announced that the nation was at war with England and the U.S. and revealed the startling success of the surprise attack on U.S. naval forces at Pearl Harbor. Pravers arose from Buddhist and Shinto shrines, and thousands upon thousands of young men made their way to the Yasukuni shrine, on a hillside near the palace, to pray that they might die as warriors and bring victory to their homeland.

Four years later, at the end of the eventful decade 1937–46, two-thirds of Tokyo lay in charred ruins, and the burned skeletons of perhaps 300,000 people were scattered among the ashes. All buildings in great areas of the city had disappeared completely. There were less than 5,000,000 residents of Tokyo now, poorly clad, on scant rations; many of them living in shanties of corrugated tin.

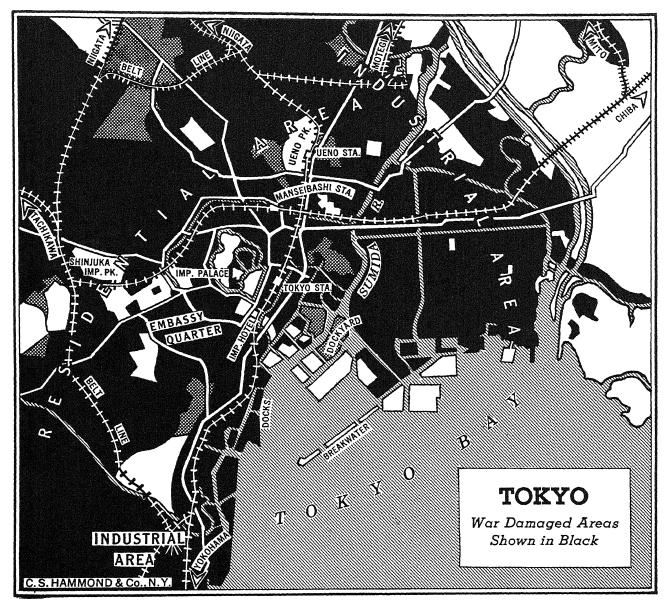

Outwardly, one thing had not changed. Tokyo's people still made pilgrimages to the imperial palace. But behind its concealing stone wall, the palace was partially burned out, too. And in addition to bowing toward the emperor, the Japanese also saluted the foreign sentries guarding his gates—U.S. soldiers of the army that occupied the country after Japan's defeat and surrender in 1945. For the first time in the 2,000-year reign of its imperial household, the flag of a foreign conqueror flew over the Japanese capital. By sufferance of the conquerors and under their orders, Hirohito still ruled, but his empire had dwindled until now it consisted of only the four main islands of Japan proper.

Few cities in history had undergone such dramatic changes as did Tokyo in the ten years from 1937 to 1946. Two dates stand out in that period: the first months of 1945, and September of that year. It was in the span from January through April that U.S. bomber planes first brought the facts of war home to the heart of Japan.

Tokyo offered an ideal target. Except for its business district, modernized after the 1923 earthquake, it consisted mostly of highly inflammable, tightly-packed buildings of wood and paper. Its industrial district stretched in a narrow belt along the railway to Yokohama, and extended into that neighbouring port city. Outside of its few modern areas, the city was composed of small villages which it had encompassed and cemented together in its centuries of growth.

Despite its size, it had never been a cosmopolitan city, nor a place of festivity. The few foreigners living there before the war had been swallowed up by the millions of Japanese. The native inhabitants of Tokyo took their pleasures in a handful of cinemas, baseball stadia or behind the closed doors of geisha houses and in the streets of the Yoshiwara. The city had no splendid vistas, no outstanding boulevards.

It was on this target that the B-29's loosed their bombs. Incendiaries spread fire and death through the capital.

Most of the industrial section, with its war plants, was wiped out. During one raid, a 40-mile-an-hour wind swept flames through the city; paper and wood buildings burned like tinder as the antiquated fire fighting system was overwhelmed. Helplessly, Tokyo's residents battled the flames with small buckets of sand.

By government order, a mass exodus started. On foot and by crippled train facilities, millions made their way into the country and to ancestral villages. The survivors worked as best they could to get war industries reorganized. But no materials were coming in through the blockade by U.S. submarines; no rice from Korea and French Indo-China.

Truck gardens were planted in the middle of the wide Nishi Ginza and amid the ruins of the Ginza which had been Tokyo's main shopping street.

Up until the surrender on Sept. 2, 1945, government officials worked in the charred shells of their ministries. A week later, General Douglas MacArthur occupied Tokyo. A few Japanese leaders took their own lives in their Tokyo homes rather than submit. A half-hundred ordinary citizens performed hara-kiri at the gates of the palace. But Tokyo's millions, ever obedient to the emperor's orders,

submitted in sullen silence to the occupation of their sacred city.

MacArthur found that the modern section of Tokyo, the buildings that housed the great firms controlling Japan's finance and industry, was nearly intact. Here he set up headquarters for the vast job of remodelling Japan from a feudal, militaristic state bent on world conquest, to a democratic nation. After the shock of the first contact between the populace and the U.S. troops, the people of Tokyo proved unexpectedly co-operative.

Hundreds of Japanese stood in the streets daily to watch MacArthur enter his offices, to take his picture or to bow reverentially.

Tokyo's jail doors were opened to free political prisoners who had starved in dark cells for years; and to admit new occupants, generals and admirals who were shortly placed on trial as war criminals, and the lesser men who had inflicted practised brutality on Allied prisoners of war. The dreaded Kempetai (military gendarmerie) was broken up; the police force reorganized as an instrument to serve the people and not to terrorize them.

After a year of occupation, black markets dealing in U.S. army goods still flourished, their customers mainly the

Dead trees and the shell-like remains of buildings characterized postwar Tokyo

new rich who had profited from the war. There was still starvation and cold. But the diet met again in its undamaged building after the first free elections in Japanese history. Rice was coming in from the U.S. Contact with the U.S. occupation troops had freed the Japanese from some of their fear and distrust of foreigners and foreign ways. Tokyo, still bleeding and ruined, was starting to rebuild for a more enlightened future. (Cl. L.)

Doolittle's Raid on Tokyo.¹—It was a month after Pearl Harbor. The United States war machine had not yet been geared to full fighting effectiveness, and the axis was riding the crest of an offensive wave from the burning sands of north Africa to the steaming jungles of the southwest Pacific. Berlin and Tokyo were making blatant and ominous threats in accompaniment to nazi and Jap victories over desperately battling, but out-manned Allied armies. This was before Midway and Guadalcanal, before El Alamein and Stalingrad.

These were crucial days—days of holding actions, defensive strategems and retreat. But in Jan. 1942, plans for a bold and daring offensive thrust against the heart of the Japanese empire were conceived in Washington, D.C. and executed successfully three months later. The plan was to bomb Tokyo itself.

The primary purpose of this raid was twofold: to cause material damage by destroying military targets and consequently to retard Jap war production; and to effect a psychological reaction by developing a fear complex in Japan, making it necessary for their military leaders to recall combat equipment from other theaties for home defense, and thereby case the pressure on Allied units elsewhere in the Pacific area. Secondarily, it was hoped that the raid would improve relationships of the U.S. and its Allies, and obtain a favourable response from the U.S. people who had been reading nothing but "bad news" from the fighting fronts.

It was with a great deal of satisfaction that Lieut. Col. (later Lieut. Gen.) James H. Doolittle was able to report the successful completion of the raid to Gen. H. H. Arnold, then commanding general of the army air forces. It later became evident that the raid exceeded expectations; aims were fulfilled completely, and in addition, the mission provided a proving ground upon which the A.A.F. learned many valuable lessons subsequently used in the victorious prosecution of the war.

In working out raid plans, the bomber deemed best for the attack was the B-25, the "Mitchell" medium bomber. Aeroplanes were obtained from the famed 17th bombardment group along with a small, selected group of volunteers—men who had had some experience with this type aircraft. Doolittle was put in command of the raiders, and after the planes had been specially outfitted for the mission, *i.e.*, stripped down, extra gas tanks installed and other modifications made, training began at Eglin field, Valparaiso, Fla., in early March 1942.

The original plan called for both take-off and landing on an aircraft carrier. However, in actual practice it was found that although take-off was comparatively easy, landing on the floating flight deck would be extremely difficult, and thus, it was decided that after "bombs away," the planes would head for either unoccupied China or Vladivostok in Siberia. The latter was much closer to Japan, but negotiations with Russia in connection with possible landings inside their territory were unsuccessful. China was the only alternative.

It was decided that the entire mission would be flown at extremely low altitude—tree-top level all the way into Tokyo, 1,500 ft. when actually bombing, and down again to low level the rest of the way into China. Each plane was to carry 2,000 lb. of bombs made up of both demolition and incendiary, depending on the targets each was to hit. And since the Norden bombsight was not very effective at low altitude, and was still secret, a simplified sight was installed in the aeroplanes. Called the "20-cent" sight, it was designed by Capt. (later Colonel) C. Ross Greening, one of the pilots on the raid, and was used with excellent results.

At Eglin, the entire group entered upon a three-week period of intensive and exhaustive training. Concentrated courses of instruction simulating carrier take-offs were instituted under the supervision of Lieut. Henry Miller, a naval officer. White lines were drawn on two runways of an auxiliary field near Eglin outlining a carrier's flight deck, and the pilots practised hour after hour getting the fully-loaded "Mitchells" into the air within the required distance.

There were long periods of special training in crosscountry flying, night flying and navigation. Flights over the Gulf of Mexico were scheduled regularly to permit pilots and navigators to become accustomed to flying without visual or radio references or landmarks. Low altitude approaches to bombing targets, rapid bombing and

¹This section was checked by James H. Doolittle for technical and factual accuracy.

evasive action were practised with diligence. Emphasis was placed on ground and air-to-ground firing for the gunners, but time did not permit drills in air-to-air tow target firing.

All the volunteers were highly capable—the cream of the nation's youth, but the transition from civilian to soldier had come swiftly; practically all of them needed more training. The pilots were the most experienced, and they were all excellent; the co-pilots were good, but required more "polish"; the bombardiers needed practice; the navigators had good training, but little practical experience; and the gunners had never before fired from an aeroplane at either moving or stationary targets. They were far from the crews trained to razor-edged sharpness which the U.S. sent into combat in later years. After three weeks, the Tokyo raiders were deemed ready, and despite the fact that additional training undoubtedly would have improved everyone's efficiency, they took off from Eglin for the last time and headed for California.

On April 2, 16 B-25s were loaded on the flight deck of the aircraft carrier "Hornet" at Alameda naval base, and a day later, the flat-top steamed out toward the take-off point deep in Jap-controlled waters—about 400 mi. off the coast of Japan. That point was never reached.

In the meantime, training continued on the carrier without respite. Lieut. Stephen Jurika, Jr., of the navy gave the raiders a series of lectures on Japan itself; Lieut. Thomas R. White, who was to play a heroic role on the mission as flight surgeon, addressed the men on first aid and sanitation; and lectures on gunnery, navigation and meteorology were given by members of the Doolittle unit and by men of the "Hornet." Gunners engaged in actual gunnery and turret practice using kites flown from the ship as targets.

The crews were briefed thoroughly on procedure to be followed on the mission. Each crew was assigned its specific targets, with alternates if conditions made it impossible to bomb the primaries. Each flight of three planes was assigned a course and coverage all its own. The entire mission was spread over a 50-mi. front in order to provide the greatest possible coverage, to create the impression that a larger number of aeroplanes took part in the raid than were actually used, and to dilute Japanese air and ground fire. This also prohibited the possibility that more than one plane would pass over any given point on the ground and assured the element of surprise.

Five flights were assigned: the first, led by Lieut. Travis Hoover, was to cover the northern part of Tokyo; the second, led by Capt. David M. Jones, was to cover the central part of Tokyo; the third, led by Capt. Edwin J. York, was to cover southern Tokyo and the north-central part of the Tokyo Bay area; the fourth, led by Capt. Greening, was to cover the southern part of Kenegawa, the city of Yokahama, and the Yokasuka navy yard; and the fifth was to go south of Tokyo, proceed to the vicinity of Nagoya and break up—one plane bombing Nagoya, one Osaka and one Kobe.

Col. Doolittle was not too encouraging in these briefings, and made it a point to emphasize that once the mission took off, the fliers were on their own. There was to be no radio communication of any kind, of course, for success and personal safety depended almost wholly on complete surprise. On shipboard, Doolittle wanted only to make sure the men knew what to do; he realized that they could and would do the job if it were humanly possible.

In addition to the "Hornet," the naval force consisted of another carrier, the "Enterprise," and several escort vessels. All aerial scouting and patrolling during the voyage was done by planes from the "Enterprise" since it was impracticable for the "Hornet" to release any of its own planes because of the B-25s parked on the flight deck. In command of this force was Rear Adm. William F. Halsey, who was destined in the months to come to lead powerful naval task forces which helped break the back of Japan's sea power. Commanding the "Hornet" itself was Capt. (later Admiral) Marc Mitscher.

(This mission saw the army and the navy co-operate with each other in a manner that had never been accomplished before. It was a forerunner of the eventual complete co-operation between the services attained later in all theatres of war.)

A great deal of thought, both before and during the voyage, was given to the best method of attack. It was originally decided to take off three hours before daylight, in order to provide security and ideal bombing conditions, assure surprise and permit the raiders to arrive at their destination before dark. This plan was abandoned, however, because those in charge were not too sure of the advisability of a night take-off; also, the navy was unwilling to light up the deck of the carrier in such dangerous waters.

A second plan was for a dawn take-off, early morning bombing, and arrival in China before nightfall. This was rejected because it was felt that the surprise element would be eliminated, increasing the hazards of the mission unnecessarily.

A third and final plan was agreed upon. This was to take off just before dark, bomb at night, and arrive in the morning at the destination—the town of Chuchow in unoccupied China. Doolittle's plane was to take off ahead of the others, arrive over Tokyo at dusk and fire an inflammable military target with incendiaries. This would minimize the over-all hazards and assure a well-lighted target for the following planes.

As it turned out, the fliers were not able to carry through this final plan of action either. The task force made contact with a Japanese patrol much sooner than expected.

At 3:10 a.m. on April 18, the first Jap patrol vessel was picked up on the radar. The course of the task force was changed as each new Japanese vessel appeared on the radar screen. Finally, in avoiding one ship, the U.S. force found itself closely confronted with another. This vessel was sunk, but it was believed that it had sent at least one message to the mainland before going to the bottom. Consequently, if this was to be a surprise raid, the fliers had to get started. Time was running out and, although the raiders wanted to get within 400 mi. of Japan, take-off was made at 35° 43' N. lat., 153° 25' E. long.—a point 824 statute miles from the heart of Tokyo.

Final instructions were given: avoid at all costs nonmilitary targets, particularly the temple of heaven. If impossible to reach the China coast, don't go to Siberia, but proceed as far west as possible, land on the water, launch the rubber boat and sail in. (This proved unnecessary for most of the planes, as they had a 25-mile-an-hour tailwind throughout the last 1,200 mi. of the flight which enabled all but one of the bombers to reach China before running out of fuel.) This plane, in direct violation of orders, went to Siberia.

After the final quick briefing, the crews climbed aboard their respective ships, and at 8:20 A.M., Doolittle's plane was the first to leave the carrier. Take-off was easy despite the heavy seas which prevailed that morning. The remaining 15 followed without mishap. In less than an hour, the

"Hornet's" flight deck was clear.

After take-off, each plane circled to the right and flew over the "Hornet," lining up the axis of the carrier with the plane's drift sight. The course of the vessel was displayed in large figures from a gun turret. This, through the use of the aircraft compass and directional gyro, enabled each pilot to check his compass and set the proper course for Tokyo. This manoeuvre was considered necessary because of the possibility of change in compass calibration, particularly on those planes which were parked close to the island of the carrier.

With Doolittle in the first ship were Lieut. Richard E. Cole, co-pilot; Lieut. Henry A. Potter, navigator; Sgt. Fred A. Braemer, bombardier and Sgt. Paul J. Leonard, gunner. Fifteen aeroplanes carrying 75 others followed Doolittle, anxious to strike the first aerial blow at Japan.

The run into the city was uneventful. The fliers were about an hour on course when they passed a camouflaged vessel which they took to be a light cruiser, and after two hours the airmen passed a multi-engined land plane headed directly for the air task force, and flying approximately 2,000 ft. From then on they passed, and tried to avoid, various civil and naval craft which dotted the water from time to time. Landfall was made north of Inubo Shuma, slightly to the right of the briefed course.

With the other flights proceeding according to instruction, Doolittle's group began to approach Tokyo from the north to drop incendiaries on selected targets. They were flying as low as terrain would permit, and noticed several small biplanes, evidently trainers, in the air above them. Ten miles from the target, the raiders encountered nine Japanese fighters, but there was no attack. Nearing the target, they climbed to 1,200 ft., dropped their bombs, lowered away to the housetops again and slid over the western outskirts of the city into some low haze and smoke. While in the target area, Japanese anti-aircraft fire became very active but inaccurate. Only one burst came close.

After leaving Tokyo, the airmen turned south again and headed out to sea, bound for the China coast. And although the skies had been clear over Japan, it was not long before the group ran into extremely bad weather. The ceiling dropped to almost zero, and when landfall was made in China, the planes climbed to 6,000 and then 8,000 ft., flying entirely on instruments.

Doolittle attempted to contact Chuchow on the command radio, but received no response. With fuel almost gone, it was time to bail out. The crew jumped, and after putting the ship on automatic pilot, Doolittle followed. He glanced at the clock on the instrument panel just before leaving the plane—it was 9:20 P.M., exactly 13 hours after he had said good-bye to the "Hornet."

Everyone in Doolittle's plane landed safely in friendly territory. They were taken to Chuchow, and in a few days reached Chungking. Before arriving there, however, Doolittle contacted Gen. Ho Yang Ling, director of the branch government in Western Chekiang province, and requested him to have a lookout kept along the seacoast, and also have all sampans and junks in the coastal area watch for planes that might have gone down at sea or had just reached shore.

By early morning of April 20, four planes and crews, in addition to Doolittle's had been located, and he wired Gen. Arnold, through the embassy at Chungking, as follows: "Tokyo successfully bombed. Due to bad weather on China coast, believe all airplanes wrecked. Five crews found safe in China so far."

As it turned out, only three of the 16 crews failed to turn up at Chungking. Capt. York's crew, being desperately short of fuel after bombing their target, headed north and landed in Siberia where they were interned by the Russians. Two crews were captured by Japanese forces in China after bailing out, one on the coast and the other inland near Lake Poyang.

Every effort was made to recover the prisoners through purchase or force. The Chinese were reluctant to use force because of the large concentration of Jap troops, but agreed to try purchasing them. They were unsuccessful, however, and it was not until the end of the war that four of the men were released from prison and returned to the U.S.: Lieutenants Chase J. Nielsen, George Barr, Robert Hite and Corp. Jacob Deshazer. Four others would never return; Lieut. Robert G. Meder died in prison of starvation, and three other airmen were executed—Lieut. Dean Hallmark, Lieut. William G. Farrow and Sgt. Harold Spatz.

Of the crewmen who landed in China (all via parachute), three were killed in accidents. Corp. Leland Faktor, an engineer-gunner, was killed after bailing out. His chute opened, but since he landed in mountainous territory, it is believed that he was the victim of a secondary fall. The other airmen, Sgt. William J. Dieter, and Corp. Donald E. Fitzmaurice, were found dead on the shore of a river.

Lieut. Ted Lawson, a pilot, was seriously injured in a crash landing, and his left leg had to be amputated. There were other injuries, but they were comparatively slight, and all recovered.

Final figures showed: of the original 80 crewmen (16 five-man planes), 64 managed to get back to safety in China, 8 were captured by the Japs (of whom 4 later returned to the U.S., 1 died in prison and 3 were executed), 3 were killed in parachute-landing accidents, and 5 were interned by the Russians.

Fourteen tons of bombs rained down on the Japanese mainland that memorable day, and hits were scored on practically all assigned primary targets. Large fires were seen by several crews as incendiaries did their deadly work on the more inflammable sections of Japan's war industries, while the demolition bombs hit factories, communication arteries, ammunition dumps, military barracks, and oil and storage warehouses.

It was actually a "hit and run" mission, with the U.S. planes gone almost before the defenders knew what was happening. One crew reported a baseball game in progress on a field directly in its line of flight, but the B-25 was over and gone before either players or spectators had a chance to dive for cover. They probably didn't realize that the city was being attacked until they heard the explosions.

Mission reports of the crews agreed that Jap antiaircraft fire was intense, but inaccurate. The Japanese judged altitude very well, but the bursts were all to the right and left, and the raiders did not lose a ship or a man to flak. One crew saw some flak burst among some barrage balloons that were in the sky and saw two or three of the balloons go down.

The fliers learned a great deal on that mission. For one thing, that in home defense, nothing could be taken for granted. "Doolittle's Daredevils" achieved complete surprise; however, adequate defense would have made this surprise an impossibility. Japanese patrol craft which spotted the Americans must have sent radio messages to shore. They were not acted upon, and the AAF could only presume that there was poor dissemination of infor-

mation on the part of the Japanese, or a complete failure of their communication system.

They had failed to provide enough fighters for interception purposes. A few fighters did make passes at the medium bombers, but with little or no effect. Several gunners reported that some of the bullets fired at them from Japanese planes actually "bounced off" the B-25s without penetrating. This was definite evidence of the inferior type of equipment committed to home defense. The fact that the interceptors made so few and ineffective attacks also demonstrated the inexperience and lack of training of the Japanese pilots. Japanese airmen in the combat areas were far superior to those at home.

The raiders had expected to be hindered by camouflage in locating the targets, but little or none was seen. Also, the targets were not dispersed enough to prevent widespread destruction from a single raid. These were costly mistakes, and they contributed materially to the success of the mission.

In Doolittle's report to Gen. Arnold after the attack, at a time when the U.S. was still in danger of a bombing raid, he recommended the following defensive measures for the country: (1) sufficient utilization of small surface craft, such as shipping boats with simple radio and simplified code, for detection purposes; (2) provision for widespread camouflage and dispersion of industry; (3) provision of the greatest number of fighters possible, to intercept bombing raids; (4) provision of an infallible detection and communication system; and (5) retention of sufficient modern aeroplanes and combat pilots within the territorial limits of the U.S. to assure adequate defense.

Japan had failed on all counts. It paid for its failure. On the other hand, the AAF learned a lot about its capabilities, its weakness and strength, and about some of the things that had to be done to achieve victory. The need for certain modifications and improvements on the aeroplanes themselves, on air equipment, including guns, gunsights, turrets, fuel pumps and other instruments and apparatus, was clearly seen.

Perhaps most important of all, the AAF saw the need for more thorough training of flight crews, especially gunners. This inadequacy was everywhere apparent. However, it was not long after this raid that a comprehensive training program was instituted in the U.S. which was to send U.S. flight personnel into combat better trained and far better equipped than any in the world. Tolbukhin, Fedor Ivanovich

), soviet army officer, was born Tolbukhin (1894of peasant parentage June 16, 1894, in the Russian village of Davydovo. After completing his elementary school work, he went to St. Petersburg (now Leningrad) to continue his education. Upon the outbreak of World War I in 1914, he joined the army and was wounded in the battle of Grodno. Sent to an officer's school he was graduated in 1915 with the rank of second lieutenant. Tolbukhin, who was decorated four times for valour in action, was a captain at the outbreak of the Russian Revolution in 1917. He joined the red army, fought in the civil war and remained with the army after peace was restored. He was chief of staff of a military district when the Germans attacked the soviet union in June 1941. Later he became chief of staff on the Crimean front, and in Nov. 1942 he was in command of one of the several soviet armies

that launched the counterattack on German forces besieged in Stalingrad.

After Stalingrad he was promoted to colonel general and was given command of the 4th Ukrainian army in the spring of 1943. He defeated German forces in the battles at Taganrog and Melitopol, was raised to the rank of an army general and participated in the reconquest of Sevastopol. Thereafter Tolbukhin was put in command of the 3rd Ukrainian army which swept through Rumania into Bulgaria. In Sept. 1944 he was made a marshal of the soviet union.

Tolbukhin's 3rd Ukrainian army participated in the battles of Budapest and Vienna in early 1945. In May 1945 he was made a cavalier of the soviet Order of Victory.

Toronto

During the decade 1937–46, Toronto made substantial progress in spite of, and perhaps partly by reason of, the conditions imposed by World War II. There was a great increase in business done; bank clearings went up from \$6,465,263,740 in 1936 to \$10,985,142,402 in 1945; postal revenue from \$7,085,301 in 1936 to \$12,290,055 in 1945; customs and excise from \$54,408,397 in 1936 to \$178,791,340 in 1945. There were great changes in the industrial, commercial and social life of the city. Huge quantities of material for war purposes—for the use of every branch of the services—were produced and, while the area of the city did not change appreciably, the population grew from 645,492 persons in 1936 to 681,802 in 1945 although large numbers of its finest young citizens joined the navy, the army and the air force.

Toronto continued to be an important commercial and industrial centre; its goods were distributed in quantity throughout the dominion and the empire; it enjoyed a good foreign trade. United States manufacturing and commercial enterprises in increasing numbers continued to establish subsidiaries and agencies in Toronto to manufacture and sell their products. It was found that for such purposes the situation of Toronto midway between the Atlantic and Pacific seaboards was good, that transportation and communication by land, water and air were available in every direction. Much progress was made in the provision of facilities for traffic by air.

During World War II, two important annual activities were suspended. The Canadian National exhibition, an annual affair for 63 consecutive years, was held for the last time in 1941, after which its grounds and its many buildings were turned over to the department of national defense. It was planned to reopen the exhibition in 1947. Similarly, the Royal Agricultural Winter fair, held annually since 1922, was discontinued in 1941, to be resumed

Chemist at the Connaught laboratory in Toronto, Ontario, preparing a penicillin extract for bottling

during the winter of 1946-47. The facilities of these two institutions, including 350 ac. of land, were used to great advantage by the services.

During the early part of the decade, construction was begun on a duplicate water supply system. It was completed at a cost of less than \$12,000,000 and placed in operation in 1942. Thus, except in the unlikely event of two systems with widely separated intakes from Lake Ontario breaking down at the same time, Toronto was assured of an abundant supply of pure water, filtered and treated. The former method of sewage disposal had not been satisfactory, nor was the plant used for that purpose adequate. A modern and effective system was designed, and construction of the first unit, to cost \$6,000,000, was under way in 1946.

The Toronto transportation system, operating the cityowned street railway and bus system, completed its 25th year of control and management in 1946. The original debenture debt of \$42,000,000 (which included the cost of taking over the railway from its private owners) had been reduced to \$12,000,000, and improvements to the system representing an outlay of \$25,000,000 had been financed out of reserves established for that purpose. The commission had paid its way completely, and the city had not been called on for any payment whatever in connection with the reduction or servicing of the debenture debt. There were reserves adequate for all needs. At the annual municipal elections on Jan. 1, 1945, the citizens of Toronto voted by a majority of 10 to 1 in favour of a rapid transit plan submitted by the commission. This plan provided for private rights of way, partly in subway and partly in open cut, for two main transit routes leading to and through the downtown area. It is to be noted also that the city-owned hydro-electric system had always paid its way without cost to the city.

Improvements and additions were made at the Provincial museum and the Toronto Art gallery. The high standard set in music by the Toronto Symphony orchestra, the promenade concerts, the Mendelssohn choir, the Hart House quartet and various other excellent organizations was fully maintained.

The business of the immense mining industry of Canada was to a great extent carried on in Toronto, and the mining stock exchange there grew to be one of the largest, if not the largest, in the world.

Towers, John Henry

Towers (1885—), U.S. naval officer, was born in Rome, Ga., Jan. 30, 1885. Graduated from the U.S. Naval academy at Annapolis in 1906, he was one of the first naval officers to qualify for naval aviation in 1911. The following year he established a world's record endurance flight in a seaplane. During World War I, Towers was assistant director of naval aviation. Six months after the war he led a squadron of flying boats that made the first trans-Atlantic flight in history (May 1919). Towers was assistant chief of the navy department's bureau of aeronautics, 1929—31, and commanding officer of the aircraft carrier "Saratoga," 1937—38. He was named chief of the bureau of aeronautics and promoted to the rank of rear admiral in June 1939.

In Sept. 1942 he was promoted to rank of vice-admiral and given command of the Pacific fleet air force. He was appointed (Feb. 11, 1944) deputy commander of the Pacific ocean areas, becoming second in command to Adm. Chester W. Nimitz. In July 1945 he replaced Vice-Adm. John McCain as head of a naval carrier task force, and on Dec. 28, 1945, he was named commander in chief of the Pacific fleet and the Pacific ocean areas, with command of the 3rd, 5th and 7th fleets.

Under the naval reorganization plan announced on Nov. 12, 1946, Towers retained his post as commander in chief, with administrative control over U.S. naval forces in the western Pacific and in Japanese waters.

Town and Regional Planning

The eventful years of the decade 1937-46, which covered the most disastrous war in history, developed new tendencies in town and regional planning throughout the world and strengthened other trends which had appeared during the years of the so-called world depression.

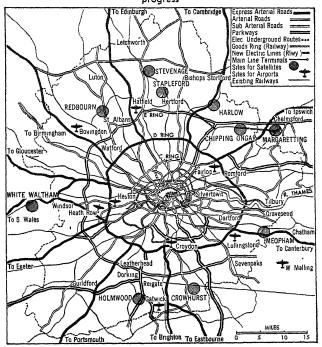

Continental Europe.—Most of the devastated European cities were working on rehabilitation plans in 1946, and many of them were subsidized by their national governments. Some hoped for reparations money from their destroyers. Even during destructive hostilities, patriotic plan-

ners and architects worked on plans for their home cities, to be ready for the peacetime reconstruction.

France was committed to a plan to reshape the nation as a physical and economic unit after the Oct. 1945 elections. French leaders recognized the evils of haphazard industrial expansion and attempted to put into effect a plan for the decentralization of industry which would control the size of cities. They hoped to stem the tide of migration from farm to city by providing better cultural and recreational facilities for farm dwellers. When the German troops withdrew, there were 6,000,000 homeless persons in France. About 400,000 houses were totally destroyed. By 1946 nearly all of the injured towns had been replanned, thanks to the many architects and planners who worked throughout the war. Little actual reconstruction had been undertaken in spite of the efforts of the General Commissariat of Modernization and Equipment to supply manpower and materials. There were two schools of planners-those who would rebuild French cities as they were, and those classified as modernists, some of whom follow Charles E. J. le Corbusier for out-and-out revolution in design, and some of whom believed that a regional pattern could be superimposed on traditional plans and classic architecture.

In Germany, despite the difficulties of running the gauntlet of approval from the four nations governing the four zones, the problem of replanning Berlin was attacked. There was established an 800-man building and housing council, which had first to clear the ruins and find use for the rubble. A plan for Berlin seemed to be definitely emerging; but it was predicted that it would take at least 20 years to provide acceptable living conditions. The new plan aimed to establish livable communities with decent working and living conditions, open spaces and adequate circulation facilities and provision for housing, industry, commerce and recreation. The schedule for issuing the plan in the spring of 1946 was postponed, it was said, because of political reasons and the required approval of the four ministries.

The Greater London plan, emphasizing decentralization, was prepared for official consideration while World War II was still in progress

It was proposed to reduce the average population density from 350 to 100 persons per gross acre.

In Italy there was evidence that the new planning might preserve the beauty of the old and provide the functional convenience of modern design. Before World War II, Italian cities, once famous for their charm, had already suffered from the fascists' over-elaborate architecture and grandiose planning, which totally overlooked the living conditions of the people. Even before the war there were only 33,000,000 rooms for 45,000,000 people. A movement was started in 1946 to place planning under the guidance of a single joint commission which would revise national planning laws to apply to emergency peacetime needs.

Warsaw, swept by four distinct waves of devastation from Sept. 1939 to Jan. 1945, was developing an ambitious reconstruction plan dominated by the two-dimensional pattern of the old city, applied with new standards of density. The new Warsaw was to be designed as the cultural, political and economic centre of Poland and as part of a national and regional plan. The population was to be decentralized into residential boroughs all within 30 min. of high-speed travel from the central district. The prewar economy basis of Warsaw was not expected to change. Even before World War II, the city owned much of the land within its confines. The new Warsaw was said to be committed to municipal ownership of all land; large areas left ownerless after the war were to be claimed by the city. Existing owners of single lots would be compensated; but those owning more than one lot would relinquish claims to all but the one for which they would be compensated. Rapid transit was expected to equalize land values. All industries employing more than 50 persons were nationalized. The planned locations for industry, it was said, were developed in consultation with the industries concerned; transportation facilities were planned to serve industries and workers. The basic unit was the residential colony. In 1946, 1,400 persons were employed in the Warsaw Reconstruction office; city planners and architects worked in teams of 3. The Warsaw Reconstruction office contained the Historic Buildings service, whose powers (like that of the office) permitted it to overrule any government or municipal authority. During the first year following the war, the national budget for reconstruction supplied 60% of the total cost. The city realized an income from leased lands and various municipal enterprises and public services.

Switzerland, itself untouched by the ravages of war, became a clearing house for information and work on all European reconstruction. The modern movement for planning and design in Switzerland was influenced by the ideas of Le Corbusier. There was a reported absence of slums in Swiss cities.

In Sweden, likewise immune from war damage, Le Corbusier also exerted an influence, as noted in the Stockholm exhibit of 1930.

Swedish cities before the war had developed a modern architecture of pleasing appearance which promised to keynote future planning.

Great Britain.—The opening of the decade 1937–46 found the people in England engaged in peacetime pursuits. After World War I great strides were made in local planning and in the provision of houses. From 1920 to the beginning of the depression more than 4,000,000 houses had been built—about 2,500,000 by private enterprise unsubsidized by government, and nearly 2,000,000 by local authorities and private enterprise subsidized by the state.

Then came the blitz and the incredible devastation of World War II. Through all the long years of the war, planning was a lively topic of conversation. The magazines were full of planning references. The Rebuilding Britain series made comprehensive and detailed proposals. A series of books called Targets for Britain appeared on the newsstands and had wide circulation. Of these, A Plan for Town and Country Planning, with a foreword by Julian Huxley, carried the gospel of planning to the general public. In 1945 Rebuilding Britain-A Twenty Year Plan by E. D. Simon appeared. Official reports were made to the government during the years of devastation. The Barlow, Scott and Uthwatt reports recommended plans and legislation to decentralize urban populations through density controls and the provision of open spaces and green belts. Recommendations were made that public funds be used to acquire title or restrictive rights in private property to prevent uncontrolled use of land. Two important items of legislation followed these reports—the Education bill and the Town and Country Planning bill of 1944, which provided for the acquisition and development of land for planning purposes, made amendments to the laws relating to town and country planning and provided for compensation payable in connection with land acquisition for public purposes by reference to 1939 prices. Two additional acts were also passed providing for the extension of the scope of housing subsidies and for the erection of 250,000 temporary houses.

During all the war years, planning reports for cities were listed. Perhaps the most discussed was The County of London Plan and The Greater London Plan prepared in part by Sir Patrick Abercrombie. In 1944 appeared the Report of the Improvements and Town Planning Committee on Postwar Reconstruction of the City of London. Some of the plans for public buildings and open spaces were very impressive; but the keynote of all these plans and proposals was decentralization, reduced densities of population and control of location of industries. Planners were thinking in terms of neighbourhood communities to be provided with schools, libraries, parks, playgrounds and shopping centres.

Plymouth, of all English cities, suffered most perhaps from war devastation, except London itself. By the spring of 1941 the citizens of Plymouth and Devonport, after 40 raids, realized their opportunity and had prepared The Plan for Plymouth. Of the business and industrial belt of 900 ac., 300 suffered from the blitz. The plan would reduce the densities in part in this area from 256 to 100 persons per acre. This decentralization involved overspill, and plans were made to push out into the country. Restored Plymouth would preserve historic landmarks but would profit by the principles of modern planning.

Manchester published a plan in 1945. The city suffered relatively slight damage but put forth a 50-year plan, providing for a series of ring roads and radial highways, for the relocation of passenger and goods terminals around an inner ring, the development of new industrial sites and the unscrambling of mixed areas of homes and industry, the development of large open areas connecting the heart with the country and insulating residence areas from industry. There was to be a progressive redevelopment of the school system and a well-studied housing program. The housing program was proposed upon a neighbourhood basis of 10,000 persons per neighbourhood and 50,000 for districts of 5 neighbourhoods.

Other cities issuing reports during 1940-46 included

Bath, Canterbury, Durham, Glasgow, Hastings, Newmarket, Northampton, Norwich, Richmond, Sheffield, Edinburgh, Belfast, Cork and Dublin.

Latin America.—Planning in Mexico centred chiefly in Mexico City, a federal district and cultural centre. Monterrey, capital of the state of Nuevo León, also had a planning commission, as did Nuevo Laiedo, on the Texas border, with necessary planning laws for a master plan. Acupulco, resort town on the Pacific coast, adopted organized planning in order to preserve the natural scenic features of its beautiful city. Tasco, the old silver town, was protected with a plan and legislation setting aside the town as a national monument. Veracruz on the Gulf of Mexico laid out a new plan and program under the guidance of Carlos Contreras.

While Mexico reserved to the local governments the initiative to form plans, the reverse was true in Peru and Chile. Central planning offices were set up by the respective governments to do all town planning throughout the countries with the aid of local offices in the larger cities. In Peru the planning was placed in charge of an office called the Section of Urban Studies, said to be one of the best-directed planning offices in South America. An effort was made to co-ordinate into a regional plan the growth and development of the 40 separate municipalities making up the Lima region. In 1929 Chilean planners were successful in having enacted the first comprehensive planning law—one which required all cities of more than 20,000 to make city plans. In 1936 there was formed a central department of urbanism in the ministry of development, with authority to make plans for all cities of more than 8,000. This office carried on planning studies for about 55 Chilean towns and cities. Legislation for each city was scheduled to become a law when the plan was approved jointly by the city authorities and the federal government, but such legislation operated without a city planning commission. Several other large cities, including Santiago, Valparaiso and Concepción, employed trained planning staffs to co-operate with the department of urbanism.

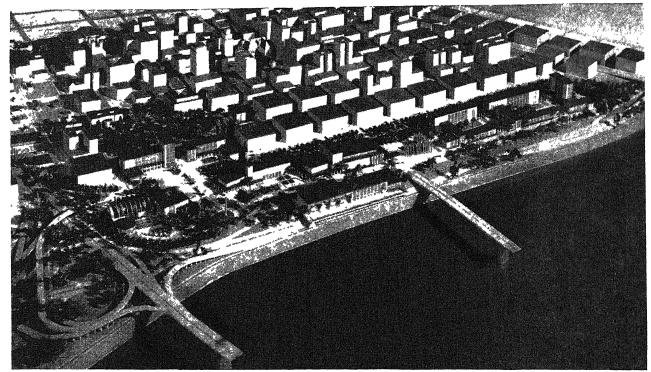

In Bolivia, La Paz, after several attempts at planning, organized a department of urbanism in 1940. In Argentina, Buenos Aires had established in the early '30s a Plan de Urbanización which operated continuously throughout the decade 1937–46 and became one of the largest and best equipped in South America. In Uruguay, Montevideo had an excellent Direción del Plan with an adequate budget to plan for the city of more than 700,000, about one-third of the population of the country. In Rio de Janeiro, Brazil, there was a Commissão do Plano da Cidade, composed of city officials and supplied with a technical staff appointed by the mayor, who in turn was appointed by the president, with no citizen representation.

The International Federation for Housing and Town Planning met in Mexico City in 1938, in Stockholm, Sweden, in 1939 and in 1946, for the first time in seven years, in Hastings, England.

United States.—The national resources planning board, which operated under various names from 1933 to 1943, greatly stimulated local planning; the program of public works inaugurated to provide employment in the 1930s included many municipal buildings which had been projected in previous plans. During the decade 1937–46, a number of pioneer planners died, including John Nolen,

[&]quot;Futurama" of the city of 1960, designed by Norman Bel Geddes for the General Motors exhibit at the New York World's fair in 1939. It featured widely spaced skyscrapers, double-decked streets and parks on the roofs of low buildings

Model of a proposed civic centre to occupy the water front area in Portland, Ore., as outlined by the City Planning commission in

Robert Whitten, Alfred Bettman and Warren H. Manning. During the depression years, business was not very brisk for planning consultants except as they were employed by or through the federal government. Nevertheless, under the influence of the national resources planning board, state planning boards were set up in most of the states, and some of these boards stimulated local planning. Beginning in 1941, it became the custom for states and cities to set up special postwar planning agencies or to designate existing agencies for the work. In 1944, congress authorized a program of federal planning advances or loans without interest to state and local governments to be administered by the Federal Works agency through a bureau of community facilities. For 1946 a total appropriation of \$30,000,000 was made available. The Public Roads act of 1944, for the first time, appropriated federal aid funds for through highways in urban territory. By 1946 all practising planning consultants were pushed to the limit to meet the demand. New city planning commissions were set up, and those which had been inactive began to function and seek planning directors.

In recognition of the prevalence of blighted areas and slums in all of the larger cities, a movement grew up in the 1940s to bring about urban redevelopment on a comprehensive scale. The Federal Housing administration issued a Handbook on Urban Redevelopment for Cities in Nov. 1941 as a result, perhaps, of the city planning service which the agency had started in 1937. In 1942 the National Planning association issued a pamphlet on "Urban Redevelopment and Housing." This was supplemented by a "Proposal for Rebuilding Blighted Areas," issued by the Urban Land institute. All of these publications were much discussed. Of the states 28 had passed some sort of legislation by 1946, 12 to authorize redevelopment corporation laws permitting corporations to engage in redevelopment; 6 had passed housing redevelopment acts which would make the public housing authority the administrative as well as the constructing agency and 10 had redevelopment land agency enabling acts which

would establish a redevelopment or land agency as an arm of the local government to administer the redevelopment program.

A good many planning reports were issued, most of them in serial form as parts of the master plan, including the following cities: New York, Chicago, Cincinnati (O.), Cleveland (O.), San Francisco (Calif.), Los Angeles (Calif.), Santa Barbara (Calif.), Saint Paul (Minn.), Denver (Colo.), Des Moines (Ia.), Omaha (Nebr.), Dallas (Tex.), Baltimore (Md.), Buffalo (N.Y.), Harrisburg (Pa.), Spokane (Wash.), Portland (Ore.), Portland (Me.), Louisville (Ky.), Toledo (O.), Detroit (Mich.), Kansas City (Mo.), Milwaukee (Wis.), New Haven (Conn.), Schenectady (N.Y.), Syracuse (N.Y.), Waterbury (Conn.) and many smaller cities. The National Resources Planning board experimented with a new technique in Tacoma, Wash., Salt Lake City, Utah, and Corpus Christi, Tex. In most of these reports attention was paid to densities of population, and often a degree of decentralization was recommended. In 1946 wartime congestions of population continued in most cities. In 1945 the Toledo Blade promoted the construction of a \$250,000-scale model of the Toledo plan which caused nationwide comment. In Boston a metropolitan study contest was won by a team from Harvard university in 1944. In Chicago the Herald-American and the Tribune promoted planning and housing contests.

After the organization of the American Society of Planning Officials and the merger of the American Civic association with the National Conference on City Planning in 1935, joint planning conferences with the American Institute of Planners, and later with the National Planning association, were held in Richmond, Va., in 1936, in Detroit in 1937, in Minneapolis, Minn., in 1938, in Boston in 1939, in San Francisco in 1940, in Philadelphia, Pa., in 1941 and in Indianapolis, Ind., in 1942. After that the

American Planning and Civic association held a separate citizens' conference in Omaha in 1943, in St. Louis in 1944 and in Dallas in 1946; none was held in 1945. The American Society of Planning Officials met in New York and Chicago. The American Institute of Planners held regional meetings with each.

Canada.—The appointment of a minister of planning and development for the province of Ontario was announced in 1945. Of cities and towns in Canada 20 had city planning committees or commissions in 1946, among them Halifax (N.S.), Montreal (Que.), Saint John (N.B.), Hamilton (Ont.), Toronto (Ont.), Windsor (Ont.), Vancouver (B.C.) and Winnipeg (Man.). (See also Housing; Public Health Engineering.)

Townsend, Francis Everett

Townsend (1867—) was born Jan. 13, 1867, in Fairbury, Ill. He was graduated from the Omaha Medical college in 1903, practised in the far west and was an assistant health officer at Long Beach, Calif.

During the height of the economic depression in the early 1930s, Townsend originated a scheme, later known as the Townsend plan, to provide an old age pension of \$200 monthly for all persons at the age of 60 who retired from active employment. According to its terms the money had to be spent within the month. As the number of pensioners would be about 10,500,000, the annual cost of

the plan would total about \$25,200,000,000; this figure represented about 37% of the national income (\$68,000,000,000) in 1937. According to Townsend, the pension fund would be financed by a pyramidal tax of 2% on commercial transactions. Critics charged that the Townsend plan was an impractical scheme which if put into practice would bankrupt the nation. Townsendites answered that the plan would stimulate consumption of commodities.

Sentiment for the Townsend plan increased enormously during the national hysteria that followed the closing of the banks in early 1933. In some areas the plan was the chief political issue, and its supporters were elected to congress. Pressure from its advocates was intense, and just before the elections of Nov. 1938 as many as 16 schemes dealing with old age pensions were brought forward. President Franklin D. Roosevelt was strongly opposed to the plan, considering it a quivotic measure; but in the first term of his presidency, he was of the opinion that congress could not withstand the pressure built up by the Townsendites unless it enacted what he termed a "real" old age insurance system. The clamour for the Townsend plan was muted somewhat by the passage of the Social Security act in 1935, although it was revived temporarily by the recession of 1937. But after the elections of Nov. 1938, its popularity slumped to the point where it was no longer a force to reckon with in politics. Despite the loss of support, Dr. Townsend continued to publicize his scheme through the Townsend National Weekly, of which he was president, and through the Townsend foundation, of which he was both president and trustee.

Toyoda, Teijiro

Toyoda (1885—), Japanese naval officer, industrialist and statesman, was born in Aug. 1885. Graduated from the Japanese naval academy, 1905, and later from the naval staff college, he was at one time Japanese naval attaché in London and was one of the signatories to the London Naval treaty of 1930. Toyoda became chief of the general section of the naval technical department in 1934 and commander-in-chief of the Sasebo naval station in 1937.

He was minister of commerce in the cabinet of Prince Fumimaro Konoye and in July 1941 succeeded Yosuke Matsuoka as foreign minister. It was generally believed that Konoye, alarmed by Matsuoka's excessive sabrerattling, decided to replace him with a "moderate." Toyoda's alleged moderation probably stemmed from the fact that he was pre-eminently a businessman. He had been president of Japan's Iron and Steel Control association and was associated with the giant Mitsui family combine by marriage. After the resignation of Konoye's third cabinet on Oct. 16, 1941, Toyoda was succeeded in the foreign ministry by Shigenori Togo. He virtually retired from the public eye until April 1945, when he reappeared in, the government again, this time as minister of munitions in the cabinet of Baron Kantaro Suzuki.

Track and Field Sports

It took only a glance at the world-record feats of 1937–46, minimized as they were by the long intervention of World War II, to realize that few track and field marks could survive a ten-year assault by the world's leading athletes. No fewer than 36 world marks were toppled,

some several times, during the decade, while numerous others were tied.

As a result, several "ceilings" were lifted on events which, some believed, had received the maximum of human endurance. For instance the pole vault, which had a ceiling of 15 ft. for most track sans in 1937, was now looking toward a 16-ft. mark as a result of the record vaults of Cornelius Warmerdam. Warmerdam, a member of the Olympic club of San Francisco, went 15 ft. 73/4 in. in 1942 in one of the outstanding track and field developments of the decade.

Even more significant, however, was the slow approach to the four-minute mile, once regarded as an obscure dream. The speed of two Swedish contemporaries, Gunder Haegg (Hagg) and Arne Andersson, sliced a full four seconds from the mile time throughout the ten-year period. Sydney Wooderson, the great British miler, started the movement with a world-record mile of 4 min. 6.4 sec. in 1937. By the time Haegg and Andersson had finished their duels of 1943, 1944 and 1945, the mark stood at 4:01.4, held by Haegg. The record was accepted by the International Amateur Athletic federation, although both Haegg and Andersson were ruled from amateur competition for life because of professionalism.

Although he lost the mile record, Wooderson at the end of the decade still held the 880-yd. mark of 1 min. 49.2 sec., made in England in 1938. Another European middle-distance star, Rudolf Harbig of Germany, established world records in the 800-m. run in 1939 and the 1,000-m. run in 1941.

The greatest onslaught on world records, however, was made by Haegg in 1942. Within a space of 74 days, the 25-yr.-old Swedish sensation set 7 world marks and unofficially held all records ranging from 1,500 to 5,000 m. Not only did Haegg run a mile in 4:04.6 in 1942, but he accomplished such world-record performances as: 1,500 m., 3:48.8; 2,000 m., 5:11.8; 3,000 m., 8:01.2; 2 mi., 8:47.8; 3 mi., 13:32.4; 5,000 m., 13:58.2.

Taisto Maki of Finland promoted a similar landslide of world records in 1939, setting marks in 5 events, 2 mi., 3 mi., 6 mi., 5,000 m. and 10,000 m. Most of his records, however, were wiped out by Haegg three years later.

United States athletes stood out in the shorter distances and field events. Two sprint records were tied when Clyde Jeffrey of the Olympic club was timed in 9.4 sec. for the 100-yd. dash in 1940 and Grover Klemmer, also of the Olympic club, matched Ben Eastman's 46.4 for the 440-yd. dash in 1941.

Fred Wolcott of Rice Institute, Houston, Tex., rewrote the record books for the hurdle events while winning six national Amateur Athletic union (A.A.U.) titles from 1938 to 1941. Wolcott set a world record of 22.3 sec. for the 200-m. low hurdles in 1941 and a mark of 22.5 for the 220-yd. lows in 1940. He also shared the high hurdle records with Forrest Towns, both the 120-yd. and the 110-m. at 13.7 sec.

Warmerdam was not alone in creating world records on the field. Les Steers, also of the Olympic club, set a world high jump record of 6 ft. 11 in. in 1941. Bob Fitch of the University of Minnesota added more than 5 ft. to the world discus mark with a toss of 180 ft. 23/4 in. in 1946. The world javelin record was raised to 258 ft. 23/8 in. in 1938 by Yrjo Nikkanen of Finland.

Indoor track gained considerable popularity during the 1937-46 era, with crowds of 15,000 not unusual at New York and Chicago. J. Gregory Rice, the Notre Dame dis-

tance star, featured the indoor season with regular assaults on the two-mile indoor record. The era also marked the exit of Glenn Cunningham, one of the world's greatest milers, and the blossoming of two other fine U.S. milers, Leslie MacMitchell of New York university and Gilbert Dodds, divinity student from Boston.

Team dominance was largely in the hands of the University of Southern California, whose great track dynasty was broken up only by World War II. Southern California won the National Collegiate A.A. tournament successively from 1937 to 1944, when Illinois came to the fore. The Trojans also won the A.A.U. team title in 1943. The New York Athletic club won nine out of ten national A.A.U. indoor titles, while Tuskegee institute of Alabama had the same record in the A.A.U. women's champion ships.

Another phenomenon of the decade was Stella Walsh, who in 1946 finished her 14th year of championship track competition and annually won two or more firsts in the national women's A.A.U. championships.

As a sideshow to the National Collegiate, the Pacific Coast and Western conferences inaugurated an annual dual meet in 1987.

Until the meet was interrupted by World War II in 1942, the Pacific Coast, led by U.S.C. and Stanford, had won four out of five. The Big Ten scored a surprise 70%-561/3 victory in 1942.

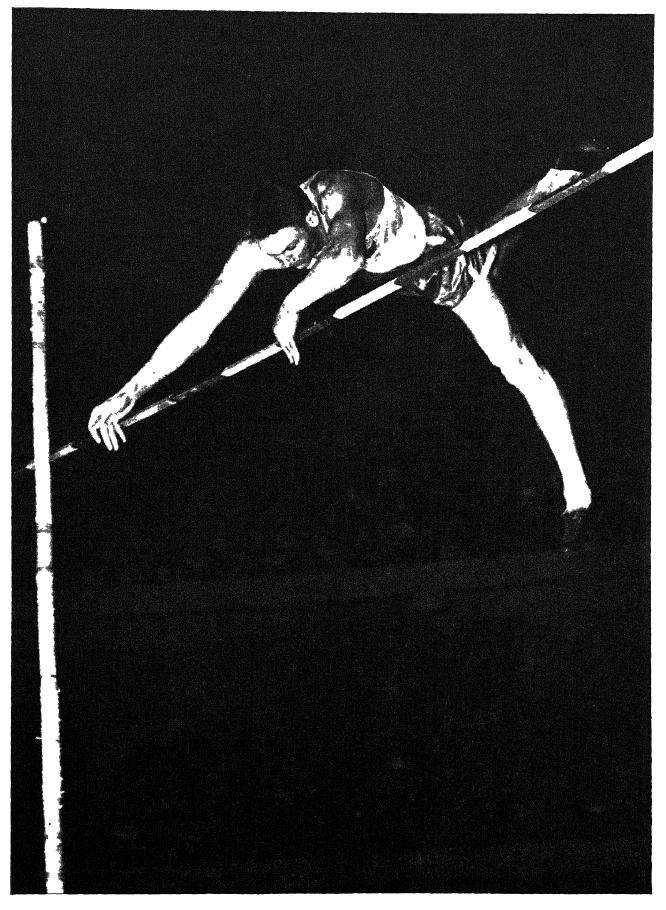

Track and Field Chronology, 1934–46.—The track and field year of 1937, coming as a slight anticlimax to the 1936 Olympic games, nonetheless produced many standout performances, particularly among newcomers. Of the 21 titles decided in the A.A.U. outdoor championships, only John Woodruff, University of Pittsburgh, won his event among the 33 Olympic games athletes who competed. Woodruff won the 800-m. run in 1 min. 50 sec. Otherwise the 1937 season was a proving ground for such championsto-be as Cornelius Warmerdam, Greg Rice, Charles Fenske, Taisto Maki and others.

The indoor season was marked by U.S. records in two distance events during the A.A.U. championships and the presence of athletes from Japan, Italy, Hungary and Canada in the numerous U.S. tournaments. Tommy Deckard of the University of Indiana set a new indoor mark of 8 min. 48.6 sec. for the 3,000-m. steeplechase, while Norman Bright of the Olympic club, San Francisco, established another U.S. record in winning the 5,000-m. run in 14 min. 45.8 sec.

Sydney Wooderson, the British middle-distance star, shattered the 3-year-old world record of Glenn Cunningham by travelling the mile in 4 min. 6.4 sec. Wooderson's record run featured the European track and field program in which Sweden stood out with a team victory over Germany, winner of the World Student championships.

Other outstanding accomplishments of the 1937 track season were: Ray Malott's time of 47.1 sec. in the 400-m. dash of the A.A.U. outdoor championships; Bill Reitz's toss of 224 ft. 93/8 in. for the javelin, fourth longest in U.S. history; Woodruff's time of 1 min. 60.3 sec. in the 880-yd. run for a new intercollegiate record and William Sefton's 14-ft. 87/8 in. in the pole vault, also a new intercollegiate record.

Southern California dominated the collegiate track picture in 1937, though vigorously challenged by Stanford. U.S.C. outlasted Stanford in the National Collegiate tour-

nament, 62–50 points, and won the Pacific Coast title by a mere point, 55–54. Pittsburgh won the I.C. 4-A outdoor title by a half point over Columbia, while Michigan easily won the Big Ten indoor and outdoor championships. Indiana university's relay team of Mel Trutt, Jim Smith, Tom Deckard and Don Lash set a new 4-mi. mark of 17 min. 16.1 sec.

Women's competition in 1937 was marked by an A.A.U. indoor record of 44 ft. 11½ in. for the 8-lb. shotput by Helen Stephens of Fulton, Mo. Tuskegee institute won the A.A.U. women's indoor title. The men's A.A.U. championships went to the Olympic club of San Francisco, outdoors, and New York Athletic club, indoors.

In 1938 57 records of varying importance were toppled by U.S. track athletes, highlighted by the 4-min.-4.4-sec. mile for Glenn Cunningham on the indoor track at Dartmouth college, Hanover, N.H. The fact that the National A.A.U. outdoor championships were staged on a slow, muddy track hindered the 1938 performers' opportunities of cracking even more records.

As a result of the soggy track, only Henry Cieman, completing the 3,000-m. walk in 13 min. 39.9 sec., established a record. The National Collegiate championships, however, produced such outstanding marks as a 4:08.3 mi. by Lou Zamperini of Southern California; a 9:11.1 for the 2 mi. by Walter Mehl of Wisconsin; a 120-yd. high hurdle time of 14 sec. by Fred Wolcott of Rice institute and a high jump deadlock between David Albritton of Ohio State and Gil Cruter of Colorado at 6 ft. 83/4 in. The mile duels of Zamperini and Charles Fenske of Wisconsin featured the track season, with Zamperini downing Fenske in the National Collegiate championships and Fenske winning the Big Ten-Pacific Coast mile in the slow time of 4:20.9.

On the European front, two world records were established. In England, Sydney Wooderson set a world mark of 1 min. 49.2 sec. for the 880-yd. dash. In Finland, Yrjo Nikkanen tossed the javelin to a new record of 258 ft. 23/8 in.

The New York Athletic club made a sweep of the A.A.U. outdoor and indoor championships in 1938, while the Uni-

versity of Southern California did the same in the National Collegiate and I.C. 4-A tournaments. Tuskegee institute repeated as A.A.U. women's titlist. Michigan again won the Big Ten outdoor crown with 60½ points to Wisconsin's 37, while Southern California outlasted Stanford, 63%-401/10, on the Pacific coast. Columbia won the indoor I.C. 4-A championship.

The A.A.U. permitted the use of starting blocks for running events for the first time in 1938.

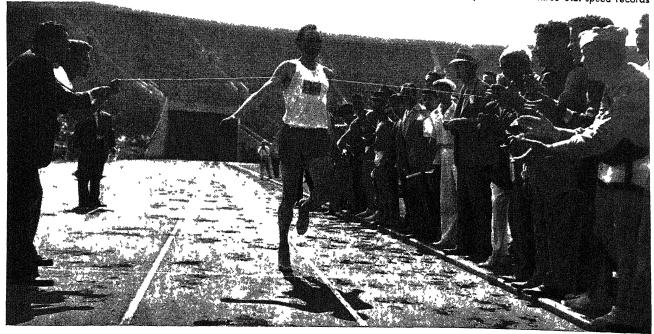

Although the Olympic games, scheduled for Helsinki, Finland, in 1940, were called off because of gathering war clouds, track and field was not without its record-shattering performances during 1939. Taisto Maki of Finland alone broke five world records, while other standout times were offered by England's Sydney Wooderson, Germany's Rudolf Harbig and the U.S.'s Charles Fenske.

Maki started cracking world records at 2 mi. and didn't stop short of 10,000 m. He recorded a world 2-mi. mark of 8 min. 53.2 sec., a 3-mi. record of 13:42.3, a 6-mi. record of 28:55.6, a 5,000 m. record of 14:16.2 and a 10,000 m. mark of 29:52.3. His times principally surpassed those of his Finnish distance predecessor, Paavo Nurmi.

Harbig established two world records during 1939. His time of 46 sec. lowered the 400-m. mark, and he added an 800-m. world record with an excellent 1 min. 46.6 sec. Wooderson again had the year's lowest mile, going the distance in 4:07.4 to establish a new British record. He also set a world 34-mi. record, as did Fenske in the 1,000-yd. run. Both distances, however, were not recognized as standard events.

Of 18 champions 11 were dethroned at the National A.A.U. outdoor tournament of 1939, won by the Olympic club of San Francisco. Outstanding performers included: Clyde Jeffrey of the Olympic club, who ran the 100 m. in 10.2 sec., and J. Gregory Rice, who won the 5,000-m. run in 14 min. 50.9 sec. The New York Athletic club retained its A.A.U. indoor crown, while the University of Southern California scored another double in winning the National

Gunder Haegg of Sweden, phenomenal track star of the decade 1937—46 and holder of world records in the one-mile and two-mile events. He is shown at the two-mile finish in a race at Los Angeles, Calif., in 1943, during which year he broke three U.S. speed records

Gilbert Dodds, Boston divinity student, winning the 1,500-metre run at the National A.A.U. meet in Triborough stadium, New York city, June 20, 1942. His time was 3:50.2

Collegiate and I.C. 4-A championships. Tuskegee institute repeated as women's A.A.U. champion. The I.C. 4-A indoor crown went to Manhattan, and Michigan continued its dominance of the Big Ten. Outstanding college feat of the season was a 55-ft.-103/s-in. toss of the shot by Elmer Hackney of Kansas State. It was a new intercollegiate record.

In 1940 United States athletes staged their own "American olympics" during the National A.A.U. outdoor championships and celebrated the occasion with one world and four U.S. records, as well as a tie for a world mark. Cornelius Warmerdam featured the tournament with his pole vault of 15 ft. 11/8 in., a world record.

Fred Wolcott, the Rice institute flier, outdid even Warmerdam in his onslaught on world records. He set a world 220-yd. low hurdle mark of 22.5 sec. and added a 200-m. record of 22.3. In the A.A.U. championships, Wolcott tied the 200-m. hurdle record of 22.6, set by Jesse Owens in 1935. Carl McBain of Los Angeles set a U.S. record in the 400-m. hurdle event at 51.6 sec. Other U.S. marks set in the A.A.U. championships were: 200 m. in 20.4 sec. by Harold Davis of the Olympic club, San Francisco, and 1,500 m. in 3 min. 47.9 sec. by Walter Mehl of Madison, Wist, only ½0 sec. slower than the world record held by Jack Lovelock

of New Zealand. In all, eight national A.A.U. records were surpassed and two were equalled during the 1940 championship meet.

Warmerdam and Wolcott, however, were not alone in the realm of world-record accomplishments. Clyde Jeffrey of the Olympic club, San Francisco, moved in with Frank Wykoff and Jesse Owens as holders of the 100-yd. record of 9.4 sec. He also tied the 100-m. mark of 10.2 sec., but the record was disallowed because of favouring conditions.

The indoor season of 1940 was also eventful. Charles Fenske emerged as the mile-king successor to Glenn Cunningham, winning 8 out of the 9 indoor mile events and recording times of 4 min. 7.4 sec. in the Millrose and New York A C. games. J. Gregory Rice, the Notre Dame graduate, highlighted the indoor season with two world indoor records. He established new marks of 8 min. 56.2 sec. for the 2 mi. and 13 min. 55.9 sec. in the 3 mi. His 3-mi. record was one of 8 which fell in the 17 events of the national A.A.U. indoor championships.

Two intercollegiate records were broken during the 1940 nationals, Ed Dugger of Tuft going over the 120-yd. high hurdles in 13.9 sec. and Alfred Blozis of Georgetown tossing the shot 52 ft. ½ in. Blozis' mark was also a U.S. record. Southern California again won the National Collegiate championship with 47 points to 28% for Stanford. Pittsburgh won the 64th annual I.C. 4-A, while Michigan again repeated as Big Ten champion, both indoor and out. Southern California narrowly won the Pacific Coast tournament, 55–53 over Stanford.

In 1941, three world records were shattered and three were tied during the U.S. outdoor season. The indoor season brought a quartet of broken records, making 1941 one of the most noteworthy in the history of track.

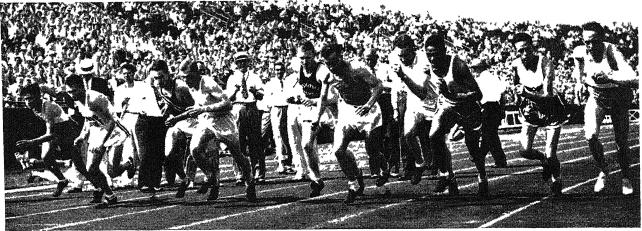

Cornelius Warmerdam reached 15 ft. 53¼ in. in the pole vault for a new world mark. His fellow Olympic clubman, Les Steers, established a world record with a leap of 6 ft. 11 in. in the high jump. The other world outdoor mark to topple before U.S. onslaught was the 2-mi. relay record, re-established at 7 min. 35.5 sec. by the University of California.

Leslie MacMitchell and J. Gregory Rice moved up with the world-record breakers in the 1941 track spotlight. MacMitchell dominated the feature mile, both indoors and out. He won 5 indoor classics and equalled Glenn Cunningham's and Charles Fenske's competitive indoor mile marks of 4:07.4 in winning the Baxter mile. MacMitchell also dominated the outdoor season, winning the A.A.U., National Collegiate A.A. and I.C. 4-A crowns.

Rice was voted the outstanding athlete of 1941 by New York track writers by virtue of his winning nine straight indoor races. He reduced his world indoor 2-mi. record to 8 min. 51.1 sec. in winning the *Chicago Daily News* 2-mi. test.

Grover Klemmer of the University of California tied the world 440-yd. record of 46.4, held solely by Ben Eastman of Stanford from 1932. Fred Wolcott of Rice institute tied 2 other world records, going over the 120-yd. high hurdles and the 110-m. high hurdles in 13.7 sec. each. Other outstanding performances of the outdoor season included a U.S. record of 174 It. 83/4 in. in the discus by Archie Harris of New Jersey, and a U.S. native record of 234 ft. 31/2 in. in the javelin by Bob Peoples of Southern California.

Rice had company in his record-breaking accomplishments indoors. John Borican set a world 600-yd. indoor record of 1:10.2, while Al Blozis hoisted the indoor shotput standard to 56 ft. 27% in. Joe McCluskey, the New York

A.C. veteran, registered a new indoor record of 9:35.4 for the 2-mi. steeplechase.

The Olympic club of San Francisco won its third straight A.A.U. outdoor title in 1941, while New York A.C. repeated as the indoor champion. Southern California continued to dominate the N.C.A.A., while New York university, led by MacMitchell, won the I.C. 4-A. Tuskegee institute repeated as women's A.A.U. champion. Stella Walsh of the Cleveland Polish Olympic team won individual scoring honours with 28 points.

The United States and Sweden dominated track in 1942, the U.S. with the record feats of Warmerdam, Rice and Harold Davis and Sweden with the middle-distance duo of Gunder Haegg and Arne Andersson. Their accomplishments made 1942 one of the most eventful years of the sport.

Warmerdam raised his pole vault ceiling to 15 ft. 73/4 in. outdoors and 15:71/4 indoors and cleared 15 ft. on 16 different occasions during the winter season. Rice easily stood out among the nation's distance runners and wound up with a world record of 13 min. 45.7 sec. in the 3-mi. run. The record-breaking performance marked the 48th straight victory for the former Notre Dame athlete. Harold Davis of the University of California was the other member of U.S.'s Big Three, completely dominating the sprint championships. Davis won the 100- and 220-yd. dashes in the National Collegiate championships and repeated his double with victories in the 100- and 200-m. events in the A.A.U. outdoor meet. He also produced a record-equalling 9.4 sec. in the 100-yd. dash, but the mark was disallowed because of questionable starting blocks. Roy Cochran of Indiana university set a world 440-yd. hurdle record of 52.2 sec.

Just as prodigious were the feats of Haegg and Andersson. Haegg established 7 world records within 74 days and unofficially held all marks ranging from 1,500 m, to 5,000 m. He ran the mile in 4:04.6, which was 1.8 sec. below the recognized world outdoor record of Sydney Wooderson of Great Britain, set in 1937. His other records, some of which lowered the previous world records by as much as 10 sec., included: 1,500 m., 3:48.8; 2,000 m., 5:11.8; 3,000 m. 8:01.2; 2 mi., 8:47.8; 3 mi., 13:32.4; 5,000 m., 13:58.2. Andersson's performances generally were obscured by those of Haegg, although he equalled Wooderson's accepted world record of 4:06.4 for the mile. World War II prevented a move to bring Haegg and Andersson to the United States for the U.S. outdoor season and also forced cancellation of the Pan-American games.

The National A.A.U. outdoor championships of 1942, stripped by World War II of its younger competitors, became largely a meet for repeats. Not only did Davis, Rice

Contestants for the national A.A.U. 5,000 metre championship at New York city in June 1943. Gunder Haegg (extreme right) won the title, outrunning U.S. track star Greg Rice (second left) by 35 yards

and Warmerdam retain titles in their specialties, but Al Blozis won his third straight shotput title, Billy Brown his fourth straight in the broad jump and Boyd Brown his fourth straight in the javelin.

The University of Southern California won its eighth straight N.C.A.A. title and captured its seventh consecutive Pacific coast crown. Ohio State won the western conference outdoor meet, Penn State dominated the east and won both the I.C. 4-A indoor and outdoor championships. New York A.C. won both the indoor and outdoor A.A.U. team titles.

Rice featured the indoor season with his record 3-mi. and also established indoor marks in the 2-, 21/4-, 21/2-, 23/4-, mi. events. Gilbert Dodds, a divinity student from Boston, administered the first defeat in 20 races to Leslie Mac-Mitchell in winning the A.A.U. indoor mile. Joe McCluskey won the 10,000- and 15,000-m. runs in the A.A.U. outdoor meet, bringing his senior championships to 23, a new record. After years of trying, John Borican won the A.A.U. outdoor 800-m. championship. Six months later he died of pernicious anaemia.

Stella Walsh wound up a decade of women's track supremacy by winning three events—the 200-m. dash, discus and broad jump, in the annual A.A.U. championship. Tuskegee institute won its sixth straight team title.

In 1943 Warmerdam, Haegg and Andersson were the Big Three of world-wide track. Warmerdam reached a new high of 15 ft. 8½ in. in the last meet of the indoor season at Chicago. Haegg toured the United States and finished with three U.S. records. Andersson remained at home in his native Sweden to lower two of Haegg's world records. He established a mile mark of 4 min. 2.6 sec. and a 1,500 m. record of 3 min. 45 sec.

Haegg did not lose a race during his summer tour of the United States, despite a long sea voyage from Sweden in a tanker. He started his eight-race tour in the two-mile event of the National A.A.U. championships, besting Greg Rice. Twenty days later he set a U.S. 2-mi. mark of 8:53.8 and later he lowered it to 8:51.3. Haegg concentrated on the mile in the last stages of his tour, setting a U.S. record of 4 min. 5.3 sec.

Harold Davis again proved king of the sprinters, once more scoring a double in the 100- and 200-m. events of the A.A.U. outdoor championships. Davis' time of 20.2 sec. in the 200-m. final was ½0 sec. less than the world record of Jesse @wen. However, because of a strong following wind, the mark was not allowed. Bill Cummins of Rice joined

with Davis as the two-event winners of the A.A.U. meet, taking both hurdle races. Lieut. Joe McCluskey of the U.S. naval reserve won his 24th A.A.U. senior title in the 3,000-m. steeplechase.

A four-man squad brought the University of Southern California its ninth straight National Intercollegiate track and field title. Michigan won both the outdoor and indoor championships of the Big Ten, while New York university topped the east with team victories in the A.A.U. indoor and I.C. 4-A outdoor tournaments. The mile, classic event of the indoor season, brought an ever-changing stream of victors during the winter season. The final summation found honours almost evenly divided among Frank Dixon of New York university, Gilbert Dodds of the Boston A.A., Earl Mitchell of the University of Indiana and Don Burnham of Dartmouth. Dixon won the National A.A.U. title, but Dodds turned in the season's fastest time of 4:08.5.

Otherwise the indoor season of 1943 was devoted to the consistency of Rice, Warmerdam and Hugh Short of Georgetown. Short tied the world record of 1:10.2 in the 600-m. run and was unbeaten in the middle-distance events before going into the army during mid-season. Herbert Thompson of Jersey City topped the indoor sprinting with a world-record-equalling 6.1 in the 60-yd. dash of the National A.A.U. meet.

Stella Walsh led her Polish Olympic Women's A.C. of Cleveland to the A.A.U. team championship with triumphs in 3 events, 10-m., 200-m. and broad jump. The Cleveland team's victory ended a six-year reign of Tuskegee institute.

The distance duel of Andersson and Haegg continued to hold the interest of track during the war-torn year of 1944. Andersson had the better of the conflicts by registering a new mile record of 4 min. 1.6 sec., cutting a full second from his previous record set the year before. In following his countryman across the line, Haegg also broke the old mark with a time of 4:02. Andersson added a ¾-mi. world mark to his accomplishments, his time of 2:56.6 lowering the previous record of 2:58.7 set in 1940 by Paul Moore of Stanford.

Haegg wasn't without glory during 1944. He twice shattered his world record for the 2-mi. He first lowered it from 8:47.8 to 8:46.4 and again plunged it to 8:42.8. He also out-raced Andersson over the 1,500-m. route, lowering Andersson's old record of 3:45 to 3:43.

Outside Sweden, the years' record-breaking feats were confined to the United States and Finland. Gilbert Dodds established a world indoor record of 4 min. 6.4 sec., while Stella Walsh broke the women's world record for the 220-yd. dash at 24.3 sec. Viljo Heino established the world mark in Finland, knocking more than 17 sec. off the 10,000-m. mark previously held by Taisto Maki. Heino's time was 29:35.2.

The United States track and field schedule, despite the dearth of top-flight performers, was carried on. The New York Athletic club won both the indoor and outdoor A.A.U. championships. Navy humbled favoured Army, 81 points to 35½, in the I.C. 4-A outdoor meet, but the cadets captured the indoor phase of the fixture. Illi-

nois ended Southern California's long reign as champion of the N.C.A.A. but trailed Michigan in both the Big Ten indoor and outdoor tournaments.

Dodds highlighted the indoor season in 1944 with 7 straight mile victories,

topped by a record 4:06.4 for the *Chicago Daily News* mile feature. Stella Walsh again took charge of women's track, tying her old 220-yd. record of 24.3 sec. The 33-yr.old veteran won 3 events in the A.A.U women's championship, but Tuskegee institute still managed to dethrone her Cleveland Polish Olympic team as champion. Alice Coachman of Tuskegee equalled the world record of 6.4 sec. for the 50-yd. dash.

In 1945 dreams of a 4-min. mi. came closer to reality when Haegg traversed the distance in the world-record time of 4 min. 1.4 sec. The new mark developed from his prolonged duel with Andersson and was marred by the professional charges levelled late in the season against the pair.

Aside from the duel of the Swedish stars, there was little to distinguish the track season of 1945. Navy dominated collegiate track, winning both the National Collegiate A.A. and Intercollegiate A.A.A. outdoor titles. Navy became the first eastern school to win the N.C.A.A. Army captured the I.C. 4-A indoor title, while Illinois won the western conference outdoor and Michigan the indoor champion ships. Roland Sink, 19-yr.-old midshipman from Harvard, proved the toast of the outdoor A.A.U. meet with his victory in the 1,500 m. over such veterans as Jim Rafferty and Rudy Simms.

Norwood (Barney) Ewell, winner of the 100-m. dash in 1941, returned to recapture the sprint title in the fine time of 10.3 sec.

The New York Athletic club won both the outdoor and indoor A.A.U. championships in 1945, while Tuskegee repeated as the women's team winner. Rafferty featured the indoor season with a sweep of all nine mile races he entered. Haegg and Hurdler Haakon Lidman arrived belatedly from Sweden to compete in the indoor season, but the Swedish miler failed to reach peak condition and was unable to defeat Rafferty.

In 1946 the continued reign of foreign milers and a world record for the discus throw highlighted the exodus of track athletes from war to tournaments. Although Haegg and Andersson were barred from amateur competition, Lennart Strand carried on the Swedish tradition to dominate U.S. competition.

Bob Fitch of the University of Minnesota registered the outstanding performance of 1946 with a toss of 180 ft. 23½ in. in the discus, a new world record. He set the new mark in the Northwest A.A.U. meet at Minneapolis, Minn., and later added a toss of 179 ft. ½ in. in the national A.A.U. meet at San Antonio, Tex. The former record, set in 1941, was held at 174 ft. 10¾ in. by Adolfo Consolini of Italy.

Strand's invasion of the United States started with his 30-yd. victory over Leslie MacMitchell in the national A.A.U. 1,500-m. run and wound up with a mile in 4 min. 9 sec., fastest of the season.

Collegians generally dominated the U.S. track picture. Not only did Fitch set a world discus record, but Harrison Dillard of Baldwin-Wallace tied the world 220-yd. low

hurdle mark of 22.5 sec. and scored the only double of the national A.A.U. championships. Herbert McKenley of the University of Illinois, a native of Jamaica, was timed in 46.2 sec. in the 440-yd. dash, but his possible world record was disallowed because of a favouring wind. McKenley did set a 300-yd. record of 29.8 sec. in a special meet at Randall Island, N.Y.

Other outstanding performers during 1946 included: Bernie Mayer, New York university, who tossed the 8-lb. shot 71 ft. 71/4 in., a U.S. record; Bill Martineson, Baylor university, who ran the 150-yd. dash in 14.1 sec., equalling the world record and Kenneth Wiesner, Marquette university, who high jumped 6 ft. 63/4 in., setting an intercollegiate record.

The University of Illinois dominated collegiate track, winning the N.C.A.A. and Big Nine championships and capturing three events in the Penn relays. The New York Athletic club won both the A.A.U. outdoor and indoor titles, while army won the I.C. 4-A indoor and navy the I.C. 4-A outdoor titles.

Sydney Wooderson continued to burn up European

100-Metre Run

tracks with a 3-mi. time of 13 min. 53.2 scc., a new British record. Sweden won Europe's first track meet since 1938 Most important international development, however, was the barring for life of Haegg and Andersson by the Swedish Athletic association after Haegg's world mark of 4:01.4 for the mile had been officially accepted.

MacMitchell featured the indoor season with seven straight victories in the mile, including the coveted A.A.U. event. Fred Sickinger, back at Manhattan college after two years in the army, also won 7 races during the 1946 season, 4 1,000-yd. events, 2 ½-mi. and the I.C. 4-A 600-yd. test.

Once again Alice Coachman and her Tuskegee institute team dominated the women's A.A.U. championships. Miss Coachman repeated her triple titles in the 50 m., 100-m. and high jump. Stella Walsh, completing her 20th year of competition, scored two firsts and a second. (M. P. W.)

Trans-Jordan

Trans-Jordan, an Arab nation to the east of Palestine, was formerly part of the Turkish empire. After World War I it was a British mandated territory until 1946. During that period it was under the supervision of the British high commissioner for Palestine and Trans-Jordan. It became an independent state in 1946. King: Abdullah Ibn Hussein, emir of Trans-Jordan since 1922. Area: 34,740 sq.mi.; pop. c. 350,000, all Arab-speaking and, with the exception of about 30,000 native Christians, Mohammedans. Capital: Amman (25,000); other cities: Es-Salt, Maan.

The relations between Great Britain and Trans-Jordan were governed by the treaty of Feb. 20, 1928. Internally Trans-Jordan was ruled according to the constitution promulgated in Amman on April 16, 1928. The development of the country with its seminomadic population had been slow, but steady progress was made after 1925 in the fields of education, public health and agriculture.

In May 1939 the British government agreed to expand the autonomy of Trans-Jordan. The constitution of the country was liberalized. In the first years of World War II, when German and Italian forces threatened to overrun the middle east, Trans-Jordan gained in importance for the

King Abdullah Ibn Hussein of Trans-Jordan who received his royal title on May 25, 1946. He is shown at the palace entrance in Amman

maintenance of the military security and stability of the middle east. When in 1941 a pro-German government rose to power through a military coup in the neighbour-

ing Arab kingdom of Iraq, the emir of Trans-Jordan not only kept the Arab tribes loyal to their alliance with Great Britain, but also made Trans-Jordan the base for the advance of a small British force into Iraq which succeeded in re-installing the legal regent of Iraq who had taken refuge in Trans-Jordan. In reward for this important help to the cause of Britain and its allies, the country was promised independence after the conclusion of the war. The people of Trans-Jordan took a lively interest in the cause of "Arab Palestine." Emir Abdullah cabled on March 3, 1944, a sharp protest to President Franklin D. Roosevelt against the pending senate resolution of support for a Jewish Palestine. Trans-Jordan participated in the conference of Arab states in Cairo, Egypt, in the fall of 1944 to protect "Arab Palestine" and to discuss closer collaboration among the Arab states. When the Arab league began to function in 1945, as the international representation of the Arab states, Trans-Jordan was one of its seven members. The prime minister of Trans-Jordan took an active part in the affairs of the league and in the defense of Arab rights in Palestine.

On March 22, 1946, Great Britain and Trans-Jordan signed a treaty of mutual assistance and alliance. The treaty put an end to the British mandate and recognized Trans-Jordan as an independent sovereign state. In order to make the alliance effective, Trans-Jordan was to provide lines of communication through the country for Britain, which could station armed forces there. Should either party become involved in hostilities as the result of attack by a third party, the other party would immediately come to its aid. Costs incurred by Trans-Jordan in fulfilment of this treaty provision were to be borne by Britain. On May 25, 1946, Emir Abdullah assumed the title of king of Trans-Jordan and in a brief ceremony of enthronement called upon the Arab world to unite into a federation.

Trap-shooting

The Grand American handicap, world series of the trap-shooting sport, extended to 47 yr. its tradition of never crowning a champion more than once. Ten different shooters wore the crown from 1937 to 1946 during the annual August shoot at Vandalia, O.

World War II made its inroads on the Grand American championships, cutting it from 950 to 500 targets starting in 1943, but the classic was back to peacetime status in 1946. A field of 1,487 competed in the 1946 championships, firing 1,317,500 shells. Prior to World War II it was estimated that there were approximately 1,000,000 shooters in the United States who spent an average of \$50 annually for shells and accessories, not including guns.

Joe Hiestand of Hillsboro, O., proved the standout individual of the decade with two noteworthy feats. In 1938 he broke 966 consecutive targets from 16 yd. for a world record. In 1944 Hiestand became the first shooter in tournament history to win a major event four times when he annexed the North American clay target championship.

In 1937 Franklin G. Carroll of Brecksville, O., outshot a field of more than 1,200 shooters to win the Grand American handicap. Shooting at 19 yd., Carroll broke all 100 targets, leaving 11 shooters tied for second with 99 out of 100. He was the third winner to break a possible 100 targets in the 38-yr. history of the Grand American. Phil Miller of French Lick, Ind., captured the North American Clay Target title with 275 out of 275, while Hal Jones of Wood River, Ill., continued the high-grade shooting by winning the champion of champions with 125 out of 125. Lela Hall of Strasburg, Mo., was crowned women's titlist, 194 out of 200. Walter Beaver of Conshohocken, Pa., won the national amateur with 198 out of 200.

O. W. "Ted" West, Coshocton, O., highway engineer, won the Grand American in 1938 with a 99 out of 100 and a 23 out of 25 in the shoot-off. The North American handicap went to Joe Hiestand of Hillsboro, O., 200 out of 200, who broke 966 consecutive targets from 16 yd. to set a world record. M. Hootman of Hicksville, O., was crowned champion of champions, 221 out of 225, while Mrs. Ryba Peters of Springfield, O., won the Grand American women's handicap with 93 out of 100. Walter Beaver of Conshohocken, Pa., repeated as national amateur champion, 99 out of 100.

In 1939 Dwight L. Ritchie, a left-handed marksman from Goshen, O., won the Grand American handicap with 99 out of 100 and 22 out of 25 in a shoot-off with G. A. Wagner of Dayton, O. P. O. Harbage of West Jefferson, O., scored a perfect 200 out of 200 to win the North American handicap, while W. A. Peterson of Lynn, Mass., won the champion of champions, 100 out of 100. Mrs. Roy Meadows of Des Moines, Ia., won the women's Grand American with 94 out of 100.

E. H. Wolfe of Charleston, W.Va., breaking 98 out of 100 birds from the 23-yd. mark, won the Grand American

handicap title in 1940. Forest W. McNeir of Houston, Tex., topped the North American Clay Target field with 200 out of 200 and Sam H. Sharman of Salt Lake City, Utah, won the champion of champions crown with 99 out of 100. Mrs. Lela Hall of Strasburg, Mo., won the women's grand handicap, 95 out of 100.

In 1941 Walter L. Tulbert of Detroit, Mich., won the Grand American handicap in a shoot-off after breaking 99 out of 100 birds in the regular test. Miss W. M. Hill of Kansas City, Mo., won the women's Grand American with 96 out of 100. Walter S. Beaver of Conshohocken, Pa., was the year's leading over-all shooter, winning the class AA crown in the national amateur singles and the Class A title in the doubles, as well as the eastern states singles and doubles.

Illinois marksmen dominated 1942, topped by the victory of James F. Holderman, 32-yr. old farmer from Morris, Ill., in the Grand American handicap. Tied at 193 out of 200 with Arthur Finney of Mankato, Minn., Holderman won in a shoot-off with a possible 25 to Finney's 23. William Drennan of Utica, Ill., won the North American title, while Joe Moore of Kewanee, Ill., was crowned champion of champions. Carolyn Elliott, 19-yr. old Vanderbilt university coed, won the women's Grand American handicap at 183 out of 200.

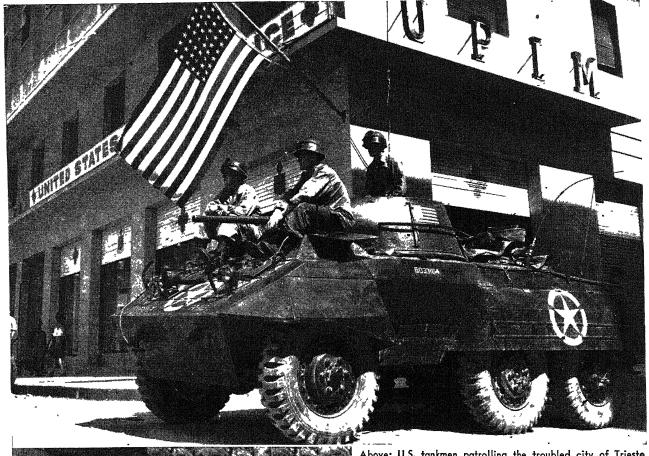

In 1943 the state of Ohio won its 13th Grand American handicap in the 44-yr. history of the event when Jasper Rogers, 35-yr. old Dayton toolmaker, survived a six-way shoot-off after scoring 97 out of 100 in the regular test. L. E. Smith of Peru, Ind., won the champion of champions title, 99 out of 100, while Orla Booher of Farmland, Ind., won the North American with 200 out of 200. Skipper Winski, 17-yr. old girl from Wellsburg, W.Va., won both the women's Grand American and preliminary handicaps.

Leslie C. Jepsen of Dwight, Ill., won the 1944 Grand American with 97 out of 100 while firing with a borrowed gun. Joe Hiestand of Hillsboro, O., scored 200 straight to win the North American title, and Mrs. Van Marker of Evanston, Ill., won the women's Grand American, 90 out of 100. John Peterson of Racine, Wis., 98 out of 100, captured the champion of champions.

Don Englebry, a Vermilion, O., restaurant owner, broke 99 out of 100 targets to win the Grand American in 1945. Otherwise, principal honours went to Rudy Etchen, 22-yr. old gunnery specialist from the U.S. navy and Memphis, Tenn., who won three titles, the over-all with 474 out of a possible 500, the all-around with 381 out of 400 and the doubles, 96 out of 100. Mrs. Van Marker, repeated as Grand American women's titlist, 94 out of 100, while E. T. Pugh of Morris, Ill., won the North American, 199 out of 200, and Lt. Vic Reinder of Waukesha, Wis., captured the champion of champions title.

In 1946 Capt. Frank Bennett, an aeroplane pilot with 9,400 hr. of flying time, won the Grand American handicap in a three-way shoot-off after finishing with 98 out of 100. Walter Beaver of Conshohocken, Pa., won the North American event with 199 out of 200 and 25 out of 25 in the shoot-off. Mrs. Roy Meadows of Grimes, Ia., won the women's Grand American, 94 out of 100. Reinder, now a University of Wisconsin biology professor, won the men's champion of champions title, 100 out of 100, and the open title, 99 out of 100. (M. P. W.)

Trieste

Trieste is a city and port on the northeastern Adriatic (pop. 248,379 in 1936) and the chief city of the Italian province of Venezia Giulia e Zara (area 3,456 sq.mi.; pop. 977,257). This territory had formed part of Austria (Trieste from 1382) before World War I. It was then called Küstenland. It had an area of 3,084 sq.mi. with a pop. (1900) of 755,183. It consisted of three divisions, the margraviate of Istria (pop. 344,173, of whom one-third were Italian), the county of Gorizia and Gradiska (pop. 232,338, of whom one-third were Italian) and the city of Trieste. After World War I the territory was claimed by Yugoslavia and by Italy. The Italian population was preponderant in the cities; the Yugoslav population, Slovene and Croat, in the rural districts. According to the census of 1910 there were 387,000 Italians and 435,000 Slavs, almost all Roman Catholics.

The disposition of the territory played a major role at the peace conference of 1919. It was closely connected with the question of Fiume and Dalmatia. The control of the territory was settled by the treaty of Rapallo of Nov. 12, 1920, between Italy and Yugoslavia, which gave the territory to Italy. The Italian government subjected the Slav majority to rigorous measures of Italianization. Thus the racial animosities in the territory became even more bitter.

The collapse of the German armies in April 1945 brought Marshal Tito's Yugoslav forces into the occupation of the territory; Tito declared his determination to incorporate it into Yugoslavia. Italy was united in an equally determined protest against the annexation of Venezia Giulia and especially of Trieste by the Yugoslavs. The Allied armies wished to have the question settled by the peace conference and to avoid any onesided settlement by force. The acting U.S. secretary of state, Joseph C. Grew, declared on May 12, 1945, that "it is the firm policy of the United States that territorial changes should be made only after thorough study and after full consultation and deliberation between the various governments concerned." As northeastern Italy was an Anglo-U.S. theatre of operations, an Allied military administration was established and the Yugoslav forces were prevailed upon to relinquish at least the smaller and predominantly Italian part of the territory to Allied administration until final settlement of the dispute. In an agreement concluded on June 9, 1945, the cities of Trieste, Gorizia and Pola and the territory connecting them were placed under Allied administration while the much larger part of the province east of that line was put under Yugoslavia without prejudice of the ultimate disposal of that area.

Zara in Dalmatia and Fiume came under Yugoslav ad-

ministration.

In 1946 the Paris peace conference decided that the largest part of Venezia Giulia should be given to Yugoslavia, including the purely Italian cities of western Istria and the famous naval base of Pola. On the other hand, the city of Trieste and its immediate neighbourhood was to become a free state under United Nations supervision. Trieste was to establish a free port for the use of all the hinterland.

Trotsky, Leon

Trotsky (1879-1940) also bore the first and middle names Lev Davidovitch; his real name was Bronstein. One of the great revolutionary leaders of his era, he was born near Elizavetgrad, Russia, the son of a middle class Jewish family, and was educated at the University of Odessa. Entering revolutionary politics at a youthful age, he was arrested in 1898 and deported to Siberia; he escaped four years later and went to England, where he became associated with Nicolai Lenin. In 1905 he returned to Russia but was soon arrested again, along with the entire St. Petersburg soviet, of which he had become a member. Once more he was successful in escaping from his Siberian exile, however, and he spent the next few years in Vienna, Constantinople, Zurich and Paris. He was expelled from France in 1916 and proceeded to the United States, where for a short while he edited a revolutionary paper, Novy Mir (New World). Meanwhile, the Russian revolution had broken out (March 1917), and he left for his native country. After a brief internment by the British at Halifax, he arrived at Petrograd shortly after Lenin.

For the next six years Trotsky's name was linked inseparably with that of Lenin as communist revolution leader. He organized the Red army and rebuilt the shattered Russian transportation system; he was equally brilliant as a writer and orator. After Lenin's death in 1924, it seemed natural that Trotsky would inherit the mantle of power. Actually, however, considerable opposition to him had developed within the Communist party. He was attacked by Joseph Stalin and Grigory Zinoviev in particular, and soon lost his post as commissar of war. Stalin gradually assumed power, and in Nov. 1927 Trotsky was expelled from the party; in 1928 he was banished from the country and later went to Constantinople. In 1936 he moved to Norway and the following year to Mexico, where he continued to denounce Stalin's regime as a "betrayal of the Revolution," as "undemocratic" and "nationalist-Bonapartist."

On Aug. 20, 1940, he was fatally attacked in his sub-

357

urban home near Mexico City by a man whom he described, before his death the following day, as an agent of the Russian O.G.P.U. The assassin gave his name as Frank Jackson but was later identified as Jacques M. van den Dreschd.

Truman, Harry S.

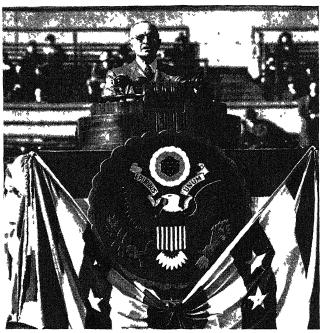

Truman (1884-), 33rd president of the United States, succeeded Franklin Delano Roosevelt upon the latter's death April 12, 1945; he had been vice-president for only three months.

He was born in Lamar, Mo., and educated in public schools. After service overseas in World War I as a lieutenant and captain of field artillery, and a brief business career, he rose rapidly in politics. Under the sponsorship of the Pendergast political organization in Kansas City, Truman became judge of the Jackson county court in 1922. In 1926 he was made presiding judge, a position he held until 1934, when he was elected to the United States senate as a Democrat. His first term was unspectacular, but he won the confidence and respect of his colleagues and revealed talent as an investigator when the Interstate Commerce committee, of which he was a member, conducted a special railroad inquiry.

After re-election to the senate in 1940, Truman offered a resolution calling for a special senate committee to investigate the national defense program. The resolution was approved in Feb. 1941 and Truman became chairman of the committee. It quickly achieved fame as it made careful investigations of the conduct of the defense and war programs. Under Truman's chairmanship no minority reports were ever written. Republicans and Democrats worked well together under his leadership. There was never any charge of partisanship made against the committee, nor any serious criticism of its methods. The committee itself was sharply critical at times of many in industry, the armed services and the civilian war agencies. The White House did not escape criticism; but the committee held the respect of the senate and the country.

As a senator, Truman's main efforts were devoted to the committee which bore his name. He seldom took a major part in floor debates or in legislative fights. He was quiet and retiring except in the work of his investigating committee. He voted for all the major foreign and domestic legislation requested by the administration, but was regarded as more middle-of-the-road than some of the more ardent Roosevelt supporters.

Early in 1944, when Democratic politicians were seeking a running mate for President Roosevelt in his fourth campaign for the presidency, Truman's name was occasionally mentioned. It was not prominently mentioned until a short time before the Democratic national convention met in July in Chicago, Ill. Con-

President Truman delivering an Army day address at Soldier field, Chicago, on April 6, 1946. Broadcast throughout the world, his speech emphasized the need for U.S. preparedness as a safeguard for world peace

servative members of the party had persuaded the president that Henry A. Wallace, then vice-president, should not be renominated. When the convention met, Roosevelt expressed first choice for Wallace but said he would be happy to run with Truman or Justice William O. Douglas of the supreme court. The campaign for Truman had been conducted by Robert E. Hannegan of Missouri, chairman of the Democratic national committee

After a bitter convention fight, Truman was nominated for the vice-presidency on the second ballot. He was elected vice-president on Nov. 7, 1944, and took office Jan. 20, 1945, as the third vice-president to serve with Roosevelt.

Upon being sworn in as president in the cabinet room at the White House shortly after notification of Roosevelt's death, Truman pledged himself to carry out the policies of the late president. His first few weeks in the White House were crowded with history. He promptly announced that the San Francisco conference to draft the charter of the United Nations would open as scheduled on April 25. He urged the conference delegates to establish an organization that would "maintain peace and redeem the terrible sacrifice of the war."

The war in Europe was rapidly drawing to a close when Truman became president. On May 8, Truman announced the unconditional surrender of Germany. There was satisfaction throughout the country with the manner in which the new president handled the surrender. He continued to enjoy great popularity throughout the summer.

In July 1945 he sailed for Europe to hold his first meeting with Joseph Stalin and Winston Churchill. At Potsdam, Germany, the three leaders agreed on the control of Germany and final decisions were reached on the prosecution of the Japanese war. On Aug. 6, while on his way home, the president announced that the first atomic bomb had been dropped on Hiroshima, Japan.

On Aug. 11, he announced that the U.S.S.R. had declared war on Japan.

At 7 P.M. on Aug. 14, Truman announced that Japan, too, had surrendered unconditionally and that World War II had been won.

Shortly thereafter, Truman turned his attention to domestic problems, and his troubles began. In a long message to congress in Sept. 1945 he set forth a detailed legislative program. It was hailed as a liberal program, and brought forth cries of protest from anti-New Dealers. The fight with congress, dominated by Republicans and conservative Democrats, was just beginning. When congress recessed in December with none of the president's major demands acted upon, he took the fight to the people in a caustic radio report on congressional inactivity. But he began losing support also of progressive and labour groups, which complained that he did not fight hard enough for his legislative program. His reorganized cabinet, decidedly more conservative than the Roosevelt cabinet, was the target of criticism.

While battling his first round with congress, the Council of Foreign Ministers, which was created at the Potsdam conference, met in London and ended in failure. Relations with the soviet union had deteriorated. In Dec. 1945, therefore, Secretary of State James Byrncs flew to Moscow for extended conferences with Foreign Minister Vyacheslav Molotov and Generalissimo Stalin. A decision was reached to sponsor the establishment in the United Nations of an atomic energy commission. The problem had been carefully discussed in a White House meeting between the president, Prime Minister Clement Attlee of Great Britain and Prime Minister Mackenzie King of Canada.

Labour troubles gave the president his biggest headache early in 1946. Strikes in several basic industries, including steel and coal, brought White House intervention. Neither labour nor capital was pleased, and politicians were critical of the president. He replied that he had asked congress for long-range labour legislation, but had got nothing. At the height of the industrial conflict, the bitter fight against the nomination of Edwin W. Pauley to be undersecretary of the navy was waged in the Senate Naval Affairs committee. Amid criticisms of his chief advisers, the president withdrew the nomination on March 13, 1946.

The railroad strike in May 1946 angered the harassed president, who asked congress in a special message on May 25 for power to draft strikers against the government into the army. After 40 minutes' debate, the house passed the emergency bill.

The senate amended it substantially, but when Truman vetoed the Case strike-control bill the emergency bill was allowed to die.

A bitter fight then developed over extension of price controls. When congress passed a bill which the White House called inflationary, Truman vetoed it and demanded a stronger one. For three weeks in July 1946 the country was without price controls, and prices began to rise. Before the end of the month a new bill, which the president termed better than the one he vetoed, was passed and signed. With the spectre of inflation hanging over the country, price control became the basic issue of the 1946 congressional campaigns and the Democrats lost heavily. (See Elections; United States.)

Truscott, Lucian King, Jr.

Truscott (1895-), U.S. aimy officer, was born Jan. 9, 1895, in Chatfield, Tex., the son of a country doctor. After finishing high school, he taught in rural Oklahoma schools. He joined the U.S. army in 1917, and retained his commission after the armistice. He studied at the Command and General Staff school, instructed at Fort Riley and was a lieutenant colonel at the time of the Pearl Harbor attack in Dec. 1941. In May 1942 he was sent to England and was attached to Adm. Mountbatten's combined operations staff. In the North African campaign Truscott led a special task force that captured Port Lyautey in the initial phases of the invasion, Nov. 1942. During the final operations in Tunisia, Truscott, then a major general, became commander of the 3rd U.S. division. The 3rd took part in the Sicilian invasion, July 1943, and fought in the Italian campaign. In March 1944 he was appointed commander of the 6th U.S. army corps and in August of the same year, he led the 6th corps in the landings in southern France.

Truscott, who was made a lieutenant general (temporary rank) in Sept. 1944 returned to Italy the following December to assume command of the Allied 5th army.

After the war, Truscott replaced Gen. Patton in Oct. 1945 as commander of the 3rd U.S. army and of the eastern military district of the U.S. occupation zone of Germany. On May 16, 1946, Truscott, in ill health, gave over command of the 3rd army to Lt. Gen. Geoffrey Keyes.

Tsaldaris, Constantin

Tsaldaris (1884—), Greek politician, was born in Alexandria, Egypt, in 1884. He was graduated from the University of Athens law school and later studied law and political science in France, England and Germany. On returning to Greece, he practised law for a brief period and then entered the government as minister in Crete (1920—22). A royalist by conviction, he was imprisoned in 1926 for plotting against the republic, but served only seven months of a three-year sentence. Elected to the Greek parliament in 1932, he was re-elected in 1933 and 1935. He held two undersecretaryships in the cabinet between 1934 and 1936.

Tsaldaris remained in Greece for a short time during the German occupation, but later fled to Egypt. Toward the end of World War II, he became one of the leaders of the Populist party and took a strong pro-royalist stand. He held five ministries in the short-lived Poulitsas cabinet and himself formed a cabinet (April 18, 1946), after Poulitsas resigned.

In foreign policy, Tsaldaris was committed to co-operation with the western Allies. While the Council of Foreign Ministers agreed in 1946 to return the Dodecanese to Greece, Tsaldaris' claims to Northern Epirus, corrections of the Bulgar frontier and reparations from Italy were rejected.

At home, Tsaldaris faced revolt and on Nov. 4, 1946, he broadened his government to include opposition members; in the new cabinet Populists held only 6 of the 30 portfolios.

Tuberculosis

Since the beginning of the 20th century, no significant new instrument or test had been devised to diagnose tuberculosis. The period 1937–46, however, witnessed the culmination of exceedingly important demonstrations in tuberculosis control. During this ten-year period, tuberculosis was driven to its lowest level of incidence in some areas, while in other parts of the world it reached heights that had rarely been exceeded. In the world as a whole, tuberculosis continued to be the first cause of disability and death with one exceptional year, when it was superseded by malaria.

Organizations.—The National Tuberculosis association, with its some 2,900 component societies, conducted excellent educational work through numerous pamphlets, books, movie films, medical and lay journals. The Christmas Seal sale reached its peak in 1945, with a gross income of \$15,638,755.37, in contrast to income of \$135,000 in 1908, and \$4,985,696 in 1937. The American Sanatorium association, organized in 1905, was reorganized and named the American Trudeau society in 1939; this became the medical section of the National Tuberculosis association. In 1946, 33 other nations had tuberculosis associations.

The American College of Chest Physicians, a strictly medical organization, was organized in 1934 and by 1946 was international in its scope, with members in 34 nations. Other national organizations had active committees on tuberculosis, such as the American Academy of Pediatrics, the American Student Health association, the American School Health association, the American Public Health association and the American Nurse association.

The 78th U.S. congress in July 1944 authorized the sum of \$10,000,000 for the fiscal year ending June 30, 1945, and for each fiscal year thereafter a sum sufficient to carry out the tuberculosis control program of the U.S. public health service. Approximately \$125,000,000 was spent on tuberculosis annually in the U.S. including funds derived from the seal sale, the public health service appropriation, the cost of operating sanatoriums, etc.

Diagnosis.—The tuberculin test continued to be extensively used as a delicate and accurate means of detecting the presence of living tubercle bacilli in the animal or human body. Its value was greatly enhanced during the decade because of the rapidly decreasing number of reactors. Tubercle bacilli may all die in the human body, after which reactors to tuberculin become nonreactors. No one knew the frequency of occurrence. However, in 1940 A. W. Dahlstrom reported that among 2,490 reactors 11.1% were later found to be nonreactors.

Old tuberculin properly prepared and PPD (purified protein derivative) were found of equal value as testing substances.

In 1937 H. Vollmer revived and modified the method of administration introduced by R. Lautier in 1908 and designated it the tuberculin patch test. Although this method of administration was extensively used after 1937, the following objections were offered: it is time-consuming to apply and requires more visits than other methods; some persons are sensitive to adhesive tape; with excessive perspiration the adhesive falls off; children often remove the tape soon after it is applied.

The intracutaneous method of administration devised by C. Mantoux continued to be universally used in testing animals and remained the standard method for testing humans. The time of reading tuberculin tests was extended from 48 to 72 hours by many physicians because "false reactions" have then disappeared and true reactions always persist even longer.

The tuberculin test found its greatest usefulness, first, in screening from any group all persons or animals with living germs of tuberculosis in their bodies and, second, as an indication for seeking the source of the infection of the reactor among his adult associates.

The use of the X-ray increased greatly during the decade because inspection of the chest by this method often detects location of areas of disease before they can be found by the conventional examination. However, during the last five years of the decade the previous overenthusiasm for the X-ray was considerably dampened by failures which resulted from its limitations. For example, not more than 25% of the persons rejected for military service in World War II largely because tuberculosis was said to be evident on X-ray film actually had this disease in significant form. Moreover, approximately two-thirds of the persons who were discharged from military service early in the war because of tuberculosis, had shadows on their induction films which were overlooked or were not considered significant. Similar errors occurred in many other places under different circumstances, largely because of the following limitations of X-ray: the shadows cast by areas of tuberculosis did not differ from those produced by other diseases of the lungs; only 75% of the lungs was visualized by the usual X-ray inspection; areas of disease had to be large enough to be seen by the unaided eye before they cast visible shadows.

Despite these limitations, X-ray inspection usually continued to supersede all other phases of the examination in determining location and extent of disease in the lungs. Once areas of disease are located, other phases of the examination are available to determine whether they are tuberculous. Thus, during the decade, X-ray was relegated to its proper place in the diagnostic armamentarium.

X-ray techniques were modified considerably. In 1937 there was available the usual 14x17 inch celluloid and paper film. The latter was also used in a new rapid method, by which 1,000 chest exposures were made with one machine in a working day with an excellent quality finished product and at a marked reduction in cost. Microfilms were introduced into the U.S. from Brazil in 1938. They were 35x35 millimetres in diameter. Later 4x5 inch films were used, and still later 70x70 millimetre films were introduced. These microfilms were known as photofluorograms, since they were photographs of images taken from the fluoroscopic screen.

There was a great deal of controversy concerning the efficacy of the various techniques used in making X-ray inspection of the chest. In 1945, however, a comparative study of the various X-ray methods of inspecting the chests of a large number of persons was made. Each of the individuals included in the study had a 35-millimetre photofluorogram, a 4x10-inch photofluorogram, a 14x17 inch paper film and a 14x17 inch celluloid film taken within a few minutes of one another. Independently, three chest specialists and two radiologists inspected the films. A preliminary report of this study revealed that in the actual experience of the five experts, the efficiency for casefinding purposes was of approximately the same magnitude for each of the four methods. It was found that such advantage as might be inherent in any one technique was

very much smaller in magnitude than the human error involved in X-ray inspection.

Previously, the bane of the physician had been technical differences in X-ray films made at various times of the same chest for comparison. It was with extreme rarity that one saw two or more films made at different times in the same laboratory that were not technically different. In 1943 R. H. Morgan developed a photo-timer which accomplished uniformity of exposure of photofluorograms so that those made on one date were technically the same as those made subsequently, despite marked changes in body weight, etc. If this could be adapted to usual X-ray equipment it would be one of the true contributions to the X-ray field.

In a number of disease processes of different kinds, calcium is carried in and deposited by the blood stream in such amounts as to cast dense, usually irregular shadows on the X-ray film. Tuberculosis is only one of the diseases in which this occurs. However, as tuberculosis was thought to be the most prevalent disease of the lungs, there developed the unfortunate practice of diagnosing tuberculosis in everyone whose X-ray films presented evidence of depositions of calcium. During the decade, heated controversies, almost bitter at times, were waged between those who maintained that calcium deposits always represent tuberculous lesions and those who demanded more specific evidence. The tuberculin test was occasionally condemned by those who saw evidence of calcium deposits on X-ray films of the chests of nonreactors to tuberculin. Thus, X-ray shadows, which are never pathognomonic, were allowed to supersede the accurate and highly specific tuberculin test.

In 1942 J. D. Aronson and his associates reported a close correlation between the presence of calcium deposits in the lungs and sensitivity of the tissues to coccidioidin, suggesting that calcified nodules in the lungs might be caused by infection with a fungus known as G. immitis. Further observation proved that in certain areas, such as California and Arizona, a mild form of this fungus disease (coccidioidomycosis) develops in man which usually causes no significant symptoms. The primary lesions in the lungs and regional lymph nodes throughout their development, including deposition of calcium, appear identical with those of the primary tuberculosis complex. There was no way to differentiate between the lesions of these diseases except with the coccidioidin and tuberculin tests and by recovering the organisms.

While examining a large number of student nurses for tuberculosis in 1945, Carroll E. Palmer found that evidence of calcium deposits in the chest occurred with considerable frequency in the central eastern half of the U.S. The majority of these students were nonreactors to tuberculin. The histoplasmin test was administered to 3,105 such students; the incidence of reactors corresponded with that of calcifications in the chest, reaching its height in Kansas City, Mo., with 65.8%.

Although a fungus disease known as histoplasmosis, caused by Histoplasma capsulatum, was thought to be universally fatal, Palmer's work indicated that infection with this or an immunologically related organism also results in a prevalent, mild disease which can be diagnosed only by the histoplasmin test or recovery of the organism. Palmer was cognizant of the possibility that histoplasmin may not be entirely specific for histoplasma infection but may elicit the presence of some other closely related fungus infections, inasmuch as cross-reactions are frequent with such testing material as blastomycin, as shown by C. W. Emmons and his associates. Moreover, co-existence of two or more kinds of fungus infections might be possible.

Later in 1945 A. Christie and J. C. Peterson reported on histoplasmin and tuberculin tests administered to 181 children from middle Tennessee, of whom 24.9% reacted to tuberculin and 73.5% to histoplasmin. Nearly twice as many (43.6%) histoplasmin reactors showed evidence of pulmonary calcification as tuberculin reactors (24.9%).

Not all persons who develop primary tuberculosis, coccidioidomycosis or histoplasmosis present demonstrable deposits of calcium by X-ray inspection. In tuberculosis it is rare to find as many as 20% who actually have primary complexes with any evidence whatsoever by X-ray. The fact that shadows are not seen on X-ray films does not constitute proof of the absence of tuberculosis, coccidioidomycosis or histoplasmosis. Doubtless there are cases which do not calcify. In others, the deposits are so small or so located that they are not seen on the X-ray film.

These discoveries were of extreme practical value, as they emphasized that the diagnosis of any calcified or non-calcified pulmonary or pleural lesion, regardless of its location, size, or the appearance of the shadow it casts on the X-ray film, is dependent upon specific evidence, which consists of a reaction to a specific testing substance such as tuberculin or histoplasmin, or finding the causative organism by bacteriological methods. Therefore, no physician can afford to assume the tremendous responsibility which obtains when he labels any lesion or condition of the lungs or pleura as tuberculous in the absence of the tuberculin reaction or the recovery of tubercle bacilli. Thus, in the vast majority of cases, the diagnosis of chest diseases was removed from the realm of speculation during the decade 1937–46.

Case Finding Among Special Groups.—The general hospitals of the U.S. admitted approximately 15,000,000 persons and examined about the same number in their outpatient departments annually during the decade. In many of these institutions arrangements were made for persons being examined for any cause to have an adequate examination for tuberculosis.

The problem of tuberculosis among institutions for the mentally ill had long been recognized as serious. Surveys in many places showed that as many as 10% of the inmates and the personnel had this disease, many of whom were transmitting it to others. However, it was not until about 1937 that feeble attempts were made in a few places to solve the problem. By 1946, some of the states had directors of tuberculosis control work in these institutions; with a limited number of helpers, they devoted their entire time to this activity. In these states provision was being made for the isolation, in one or a few places throughout the state, of all found to have tuberculosis. There they could be treated as soon as possible, under strict contagious disease technique, thus sparing members of personnel and other patients from the contagion. The same kind of work was also instituted in prisons where, prior to 1940, tuberculosis often was a serious problem.

A campaign was instituted to make every physician's office a centre for the diagnosis of tuberculosis, so that everyone who presents himself for any cause has the tuberculin test administered, and the reactors are completely examined. This would provide for an enormous number of annual examinations.

Surveys during the decade revealed that 1 to 1.5% of pregnant women had tuberculosis to such a degree as to require treatment. Doubtless this percentage was much higher in countries where nearly all adults were infected with tubercle bacilli. In many places all women present-

ing themselves for obstetrical care were completely examined for tuberculosis. When significant disease was found, it was treated promptly and if it remained contagious at the time of delivery, the infant was protected against infection by having no contact with the mother after birth as long as her disease remained contagious.

In the U.S. tuberculosis was spoken of as a disease of elderly people. Indeed, the tuberculosis mortality rate was reaching its height after the age of 50 years. There were two main reasons for this situation. First, the span of life had increased; thus, the number of elderly persons had increased, and in their bodies the disease had more time to mature. Second, children and young adults had been so protected against tubercle bacilli that relatively few of them were now infected with this germ.

With the decrease in tuberculosis among children and young adults, the high incidence of the disease among elderly persons stood out in bold relief. With continued protection of children and young adults against infection, the destructive forms of tuberculosis would continue to decrease. Among the persons who had passed the 50th year there was a high incidence of tuberculous infection, inasmuch as they were not protected against tubercle bacilli when they were infants, children and young adults. Therefore, this residue of tuberculosis among elderly persons would continue to cause a great deal of contagion, illness and death. In 1946, there were more than 19,000,000 persons in the U.S. 55 years or older. Tuberculosis among elderly persons was a serious problem in nearly all parts of the world; therefore it was being given due consideration in many tuberculosis control programs.

After 1937, tuberculosis workers of the U.S., England and a few other countries put forth a great deal of effort to find the disease among industrial workers. These persons were gathered together in groups in their places of work, thus facilitating large numbers of examinations in a short time. Industrial surveys on a voluntary basis were not entirely satisfactory unless an agreement was reached in advance that every person should participate. Otherwise those who knew they had tuberculosis or even suspected it, usually shunned the examination. Moreover, industrial workers constituted a small percentage of the population in most places, and thus a tuberculosis control program was incomplete when limited only to this group.

As tuberculosis is contagious, a good deal of emphasis was placed on the examination of the contacts of persons who had recently died from tuberculosis or were known to have contagious disease. This was a good procedure, but it was inadequate because a considerable percentage of persons with contagious tuberculosis did not have the disease diagnosed. Often they died from other conditions without the tuberculosis being detected unless a postmortem examination was performed. From 10 to 40% of the persons with tuberculosis were first reported to health departments by death certificate. Thus they had been permitted to transmit tubercle bacilli to their associates over long periods of time. Furthermore, in many communities the majority of persons with tuberculosis were contagious when first diagnosed. Obviously, by examining only contacts, one never would know how many contagious cases existed at any given time, and therefore work on many contacts would begin late, if at all.

The most efficacious method continued to be the periodical examination of all adult tuberculin reactors. The type of tuberculosis which causes illness and death develops only among the reactors. This new and most effective ap-

proach in communities where the incidence of tuberculosis had reached a low level, was instituted in the entire population of whole counties after 1940. All citizens were first tested with tuberculin. The chests of the adult tuberculin reactors were inspected with X-ray films, and those who presented shadows were completely examined to determine the cause of the disease. In this manner the tuberculosis status of every citizen was determined. Those with lesions not yet contagious might be treated. Those who had no finding except the tuberculin reaction could be kept under observation, as they might have significant disease at any time. Those not reacting to tuberculin could be retested periodically, and if infection occurred they could be placed on the list for observation.

During the decade 1937–46, the Committee on Tuberculosis of the American School Health association made several reports of its activities on tuberculosis in the schools. The objective of this committee was the creation of an environment free from contagious tuberculosis in all the schools of the country; this applied to personnel as well as to students.

The committee strongly recommended that the tuberculin test be administered to all preschool children, as well as those in kindergarten and in the pre-high school grades. X-ray inspection of the chest was rarely necessary because the reinfection chronic form of tuberculosis of the lungs which becomes contagious is a rarity this early in life. Nevertheless, every child who reacts to tuberculin has been in direct or indirect contact with a contagious case of tuberculosis. Thus the tuberculin reaction in the child is a clue to such a case which is often found by adequately examining the adult associates of the child.

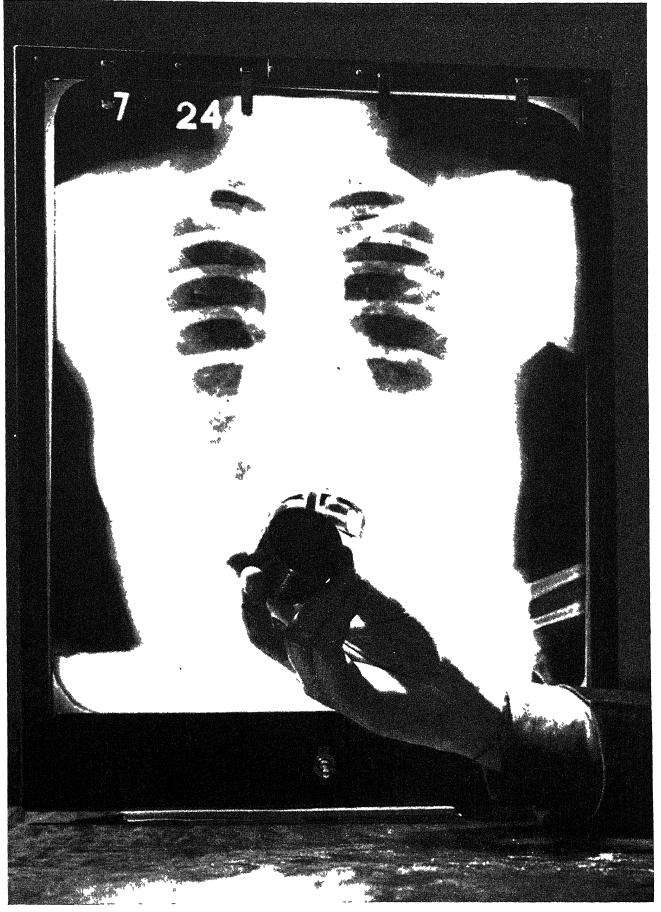

It was also strongly recommended that all high school students be tested with tuberculin and each reactor have X-ray inspection of the chest annually. In the event shadows appear, the examination is completed. This is the age period when the chronic reinfection type of tuberculosis begins to appear in the lungs of humans, and it may become contagious at this time. Numerous cases were reported of high school students infecting nearly all of their classmates.

One of the innovations which the committee introduced in 1943 consisted of officially certifying schools on the basis of tuberculosis work in progress.

Members of the personnel also were required to have the tuberculin test, repeated for the nonreactors at least every two years. Reactors on first or subsequent testing had X-ray film inspection of the chest. All reactors, regardless of the presence or absence of X-ray findings in the chest, had to be examined with reference to tuberculous lesions in other parts of their bodies. Students and members of personnel found to have progressive tuberculosis in any part of the body were removed from school until adequately treated and the danger of contagion was remote. An educational program was provided to make sure that the teaching staff understood thoroughly the underlying principles of tuberculosis control.

The Committee on Tuberculosis of the American Student Health association reported a gradual decrease in the incidence of tuberculin reactors among college and university students throughout the country. For the school year 1932-33, 35% of the students tested reacted; in the school year 1942-43, only 18.6%. In that year 13 colleges reported that less than 10% of their students reacted.

Miniature X-ray films such as these (35 mm.) proved an accurate medium for revealing chest lesions, according to a test of comparative X-ray methods conducted in 1945, and were recommended for mass radiography of the chest in tuberculosis prevention

The program recommended by the committee consisted of administering the tuberculin test to all entering students, making X-ray inspection of the chests of the reactors, and a complete examination of those with areas of disease which cast shadows that might be tuberculous. This committee extended its program to faculty members and other personnel in the hope of creating an environment free from contagious tuberculosis on U.S. college and university campuses.

The most serious problem in the institutions of higher learning occurred in those with schools of nursing and medicine where the students had become infected from patients with tuberculosis. In 1939 Ruth E. Boynton found the tuberculous infection attack rate was 100 times greater among the student nurses on a general hospital service than among students in a college of education, and 500 times greater in student nurses on a special tuberculosis service than in the college of education. From many parts of the world a high incidence of tuberculosis among students and graduates of nursing were reported.

An equally unfavourable situation was found among students and recent graduates of medicine. In some places, as many students of medicine became infected during the brief time that they were in school as had been infected from birth until the time they entered professional schools. F. E. Harrington demonstrated that strict contagious disease technique on tuberculosis services was capable of solving, in large part, the problem of tuberculosis among students. Aerosols and ultra-violet light were on trial and already offered considerable promise in destroying tubercle bacilli in the air, on the floors, etc., of rooms and wards where tuberculous patients were being treated.

H. S. Diehl and his co-workers so protected students of medicine against contagious cases of tuberculosis that very few became infected, and no clinical case developed. This was in sharp contrast to a serious situation which existed among medical students in the same school in 1937.

Treatment.-During the decade methods of collapsing the diseased areas of the lungs were improved and were used much more extensively than previously. Intrapleural artificial pneumothorax was employed much earlier in the course of the disease. Indeed, in selected cases of early tuberculosis it was extensively used by 1946, while the patient remained ambulatory and continued his usual activities of life. In more advanced and contagious cases it was utilized in combination with bed rest. This form of treatment frequently prevented the disease from becoming contagious or converted cases to a noncontagious state. Extrapleural artificial pneumothorax was a development-consisting of separating the outer layer of pleura from the chest wall, after which air is introduced into the space outside the pleura. The value of this procedure was limited.

Crushing the phrenic nerve, phreniphraxis, as it courses near the surface of the neck paralyzes the same side of the diaphragm and thus decreases the size of the chest space, as well as the movements of the lung during respiration. This treatment decreased in popularity during the decade, although it continued to serve a useful purpose in some cases.

Removal of the ribs over areas of disease, extrapleural thoracoplasty, continued to be a*standard procedure when less drastic methods of treatment*failed.

The removal of a lobe of a lung, lobectomy, or the entire lung, pneumonectomy, in the treatment of tuberculosis of the lung was developed largely during the decade. Sur-

gical technique improved to such a degree that these operations were now performed with considerable success.

With the various procedures, including strict bed rest in a hospital, sanatorium or home, artificial pneumothorax and extrapleural thoracoplasty, the disease is not cured. Nature is only assisted in walling off the disease, but the germs of tuberculosis remain alive. Although some individuals so treated recover and have complete restoration of working capacity, their disease can never be said to be cured. With the total removal of a diseased lobe or an entire lung, likewise, the tuberculosis is not cured, inasmuch as persons who undergo such treatment practically always have elsewhere in their bodies the germs of tuberculosis, which remain a constant threat to their future health

. At the end of the decade, there was still no drug capable of destroying all germs of tuberculosis in the human body. The hope of finding such a drug was nearly abandoned until about 1937, when the sulfonamides were found to be valuable in controlling other infections. Although none of these preparations proved of value in the treatment of tuberculosis, another group of compounds known as sulfones was employed. The three most extensively used drugs in this group were known as promin, diasone and promizole. The immediate effect on experimental tuberculosis was remarkable. However, further observations revealed that they apparently only suppressed the disease, since sensitivity to tuberculin was not lost in any treated animal. Moreover, in animals apparently successfully treated for a prolonged period the disease reactivated and caused death after medication was stopped. The same sulfone derivatives were administered for tuberculosis in humans but while some apparently encouraging results were observed, none proved entirely adequate.

When penicillin was found to be so effective in destroying certain infections it was immediately used in tuberculosis in animals and humans, but it proved to be of no avail. In Jan. 1944 another antibiotic substance, streptomycin, was announced. Made from the organism Actinomyces griseus, it was found to exert impressive effects in vitro and in vivo against the tubercle bacillus. W. H. Feldman, H. C. Hinshaw and F. C. Mann found streptomycin effective in resolving or suppressing established experimental tuberculous infection in guinea pigs. In most instances the drug exerted a suppressive rather than a sterilizing effect; however, in approximately 39% of the animals successfully treated the sensitivity to tuberculin disappeared, thus suggesting that a germicidal effect was exerted. Moreover, these animals were found to be sufficiently free from tubercle bacilli so that the organisms could not be detected by the most delicate means of study; namely, infection of other guinea pigs with emulsions from the spleen.

A preliminary report of a study to the effects of streptomycin on tuberculosis in humans by Hinshaw and Feldman was encouraging. Thirty-four patients who had tuberculosis were treated over varying periods of time, with subsequent observation for periods up to nine months. It appeared probable that the drug exerted a limited suppressive effect, especially upon some of the more unusual types of pulmonary and extrapulmonary tuberculosis. No convincing evidence of rapidly effective bactericidal action was obtained. However, apparently significant improvement was seen in cases of early and extensive haematogenous forms of pulmonary tuberculosis, early miliary disease, tuberculosis of the genitourinary tract and suppurative tuberculous lymphadenitis. Streptomycin was not available in sufficient quantities during the latter part of

the decade to make a thoroughgoing study of its efficaciousness in tuberculosis in humans. Although early reports were somewhat encouraging, final deductions awaited further observations.

Any drug capable of destroying tubercle bacilli in the human body would be most effective if administered soon after the initial invasion. Periodic tuberculin testing of uninfected individuals, constituting the majority in the U.S., would detect primary tuberculosis with almost 100% accuracy within eight weeks after tubercle bacilli were focalized. Then for some time thereafter one might expect to destroy all tubercle bacilli with a satisfactory drug. Thus the disease could be cured in the strict sense of the word before it had caused significant destruction of tissues. The only criterion of such cure would be the complete loss of allergy to tuberculoprotein, as indicated by subsequent tuberculin tests.

Re-education and Rehabilitation.—During 1944–46 great strides were made in providing for re-education and re-habilitation of persons recovering from tuberculosis. Many young adults were now able to complete high school courses or undertake other educational activities while being treated for tuberculosis. The federal government made provision for vocational training of handicapped persons, including the tuberculous, and in co-operation with state departments of health special training was offered and positions found for qualified persons. Special institutions, such as the Tomahawk Lake camp in Wisconsin, the Altro Work Shop in New York city and the Ida Potts Memorial hospital at Livingston, N.Y., began bridging the chasm between the sick bed and a gainful occupation for many persons.

During World War II the Committee on Tuberculosis in Wartime of the Medical Research Council of Great Britain recommended the provision of a special tuberculosis fund designed to ensure an adequate allowance for tuberculous patients for a period of up to one year after detection of the disease. The case of any person unable to work at the end of this period would be reviewed by a suitable authority. The needs of the patient and his family would determine the amount of the allowance. This scheme might also be linked with a fund to provide payments for supplementing to their full amount the wages of those returning to their employment on part-time basis or modified work. A similar scheme was being considered by the division of tuberculosis of the U.S. public health service. Such an arrangement would induce many persons to undergo treatment promptly upon diagnosis of their disease; otherwise these persons would be reluctant to give up their income necessary for the support of their families. The tuberculous wage earner, moreover, would be more likely to remain under treatment as long as his physician advised if an adequate income were provided to support his

Prevention.—The only satisfactory method of preventing tuberculosis continued to be avoidance of initial infection. The method consisted of preventing persons or animals with contagious tuberculosis from disseminating tubercle bacilli to others. This was being accomplished with a remarkable degree of success. Between 1939 and 1941, of the deaths from all causes in the U.S. 3.8% resulted from tuberculosis among the white, and 5.9% among the nonwhite population. This was in contrast to 6.9% among the white and 9.1% among the nonwhite population between 1919 and 1921.

The incidence of primary tuberculosis among U.S. university students decreased from 35% in 1932 to 18.6% in 1943. Reports from many rural communities indicated an

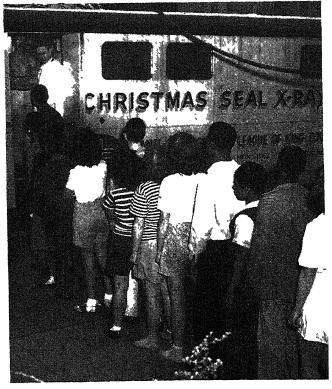

incidence of tuberculin reactors of 5 to 10% among high school students. From the available data throughout the country it appeared that only about 12 to 15% of persons of high school age were infected with tubercle bacilli.

The incidence of tuberculosis among children was rapidly decreasing. In one state, Ruth E. Boynton called attention to a mortality rate of 130 per 100,000 among infants under 1 year of age from 1915–19. But it was only 9 per 100,000 from 1940–44, a decrease of 93%. In the largest city of this state, with approximately 500,000 population, not one child died from tuberculosis from birth to 5 years of age in 1945. In the same city the infection attack rate was now only one third of 1% per year. Thus only 2% of the children were infected at the age of 6 years. In 1946, there were sizable areas in the U.S. where no preschool child had been infected with tubercle bacilli.

F. E. Harrington found that 18.9% of children in grade schools reacted to tuberculin in 1936, but among the children in the same schools in 1944, only 7.7% reacted. At the end of 15 years of effort in protecting children against tubercle bacilli, L. S. Jordan reported 153 schools in which no child reacted to tuberculin in 1946. The same year he tested 12,000 students and personnel of schools, and only 2.7% reacted. From available data it appeared that 90% of the children of grade school age in the U.S. had been protected against tubercle bacilli.

Transients and itinerant workers had long been known to disseminate tubercle bacilli. However, little was done to solve this problem in the U.S. until 1938, when the attention of the Michigan health department was called to an undue percentage of imported Mexican labourers being admitted to some of Michigan's sanatoriums. An arrangement was promptly made whereby sugar beet labourers proposing to migrate to Michigan were examined at their

Mobile X-ray clinic at Seattle, Wash. A group of college students is shown waiting for chest examinations as part of a preventive campaign in the area during 1946

concentration headquarters in San Antonio, Tex., by the Michigan department of health. Among 4,271 such persons examined in 1939 and 5,753 examined in 1940, 202 were found to have tuberculosis. Thus the rejection of these persons for employment prevented an influx into Michigan of a considerable number of persons with contagious tuberculosis.

The U.S. bureau of animal industry had long prohibited the importation of tuberculous animals, particularly cattle, but it was not until 1943 that the U.S. public health service made an attempt to control tuberculosis imported into the country by immigrants. An examination centre was established at Mexico City, where labourers were examined prior to entrance into the U.S. to work under the program of the War Food administration. During 1943 and 1944 a total of 169,421 were examined, of whom 1,499 were rejected. Eight hundred and seventy-nine had the reinfection type of tuberculosis. This probably was the beginning of a program which would ultimately include adequate examination for tuberculosis of all persons entering the U.S. It should also be extended so that no person could leave the U.S. for a foreign country unless his passport showed freedom from contagious tuberculosis. If all nations would adopt a similar procedure the spread of tuberculosis from country to country would be promptly checked.

In Nov. 1940 the entire U.S. was designated a modified accredited area with reference to tuberculosis control among cattle. This action marked the attainment of a goal set by the veterinarians and their associates in 1917. At that time the U.S. bureau of animal industry outlined a nation-wide campaign to control tuberculosis among cattle because of the tremendous losses sustained by the owners of cattle and because the cattle type of tuberculosis is transmissible to man. The county was chosen as the unit of activity, and the work consisted of testing with tuberculin all the cattle in a county and slaughtering the reactors, regardless of apparent good health. Areas of disease were found in an overwhelming percentage of the slaughtered animals. When the disease was extensive the carcass was confined to the rendering tank. If a small amount of disease was located, it was removed and the remainder of the carcass was salvaged for food. However, the meat from such carcasses was always sterilized before being placed on the market.

Whenever the county had tuberculosis so controlled that not more than 0.5% of the cattle reacted to turberculin, it was officially designated as a modified accredited area. This recognition stimulated a tremendous amount of interest and local pride which greatly accelerated the national program. The first 17 counties were accredited in 1923. By the end of 1928 all the counties in one state, North Carolina, had been accredited, and thus the entire state was designated as a modified accredited area. By 1937 44 states had qualified, and in Nov. 1940 the last state was accredited. Between July 1, 1917, and June 30, 1946, 287,689,953 tuberculin tests were administered to cattle and the 3,911,-414 reactors were slaughtered. The entire cost of accomplishing the modified accredited rating for the nation was approximately \$260,000,000, but before the work was undertaken tuberculosis was costing the cattle owners \$300,000,000 every ten years. This represented the greatest victory man had ever won over tuberculosis.

Inasmuch as the term "modified accredited" did not imply complete eradication, there was still a problem in many counties after accreditation was achieved. Therefore the veterinarians and their associates worked toward eradica-

tion, and they were successful in large areas where there was no longer to be found a single animal reacting to tuberculin. In fact, the testing of 8,454,463 cattle throughout the nation during the fiscal year ending June 1946 revealed only 0.23% reactors. The success of the veterinarians' program was also indicated at the postmortem examination made at the points of federal inspection. For example, in 1917 a total of 9,276,049 cattle were slaughtered under federal inspection, and 40,746 (0.3%) were condemned as inedible because of tuberculosis. During 1944, 12,900,544 cattle were slaughtered, of which 1,435 (0.011%) were condemned. Actually in proportion to the number slaughtered, 98% fewer were condemned in 1944 than in 1017.

Tuberculosis in other domestic animals, particularly fowls and swine, continued to be a serious problem in some sections of the U.S. However, much was done to control the disease in these animals in the same manner as among the cattle. In 1917, 76,807 hogs (0.19% of the total kill) were condemned for tuberculosis, whereas, in 1944, only 15,910 (0.021%) were condemned for this purpose. The decrease in the disease among hogs was considerably less than among cattle because hogs are susceptible not only to the bovine type, but also the human and the avian types of tubercle bacilli. Much of the tuberculosis among hogs was caused by bacilli transmitted from flocks of poultry with the disease. During the decade 1937-46, successful methods were developed to curb tuberculosis in poultry. The control of tuberculosis among domestic animals in the U.S. placed that nation in the most favourable position of all the countries involved in World War II to produce dairy products and meat without molestation from this disease.

Tuberculosis in cattle is readily transmissible to humans. Therefore, as the disease was controlled among the cattle county by county and state by state, the decrease in the mortality, morbidity and incidence of infection among humans was experienced. In fact, this was probably the most responsible factor for the sharp decline in the incidence of tuberculin reactors among children and young adults observed in the U.S. during the decade 1937-46. In countries where the disease had not been controlled among the cattle there still existed a great deal of tuberculosis of the bovine type among humans. In 1937 A. Stanley Griffith of England found that more than 50% of the persons with serious tuberculosis of the lymph nodes (scrofula) and nearly 50% of those with tuberculosis of the skin resulted from the cattle type of tubercle bacillus. Moreover, 25% of the cases of fatal tuberculous meningitis and 20% of those involving the bones and joints and genitourinary tract were the result of bovine infection. Griffith reported 163 cases of tuberculosis of the lungs caused by the bovine type of tubercle bacillus. In England alone during the decade, about 2,000 deaths occurred annually and 4,000 new cases of bovine type of tuberculosis developed each year in humans.

In 1942 Eric Hedvall of Lund, Sweden, published a monograph on the bovine type of tuberculosis in man in which he reported 94 cases that he had seen in the province of Skane. These 94 persons had tuberculosis in various parts of their bodies and ranged in age from 3 to 68 years. Fifty-three had pulmonary tuberculosis, 28 of which were serious; in fact, so serious that 16 of them had died by the time the report was made.

The disease caused by the cattle type of tubercle bacillus in man is just as serious as that produced by the human type. Indeed, Griffith and Hedvall stated that the course of the disease originated by these two types of organisms was identical and that the only possible way to differentiate the one from the other was through laboratory typing of the tubercle bacilli. Hedvall demonstrated that the cattle type of tubercle bacıllus could be transmitted from cattle to man, from man to man, and from man back to cattle. He said that in Sweden it was imperative that the campaign against tuberculosis in cattle be carried on with the greatest energy and that the goal must be the extermination of tuberculosis among these animals. Griffith made the same plea for England but, unfortunately, when World War II began only about 3% of England's cattle herds had been attested. The Committee on Tuberculosis in Wartime of the Medical Research Council of Great Britain reported in 1942 that approximately 40% of all of England's cattle reacted to tuberculin, and lesions were found in 40% of all of those slaughtered in the abattoirs.

Tuberculosis and War.-In many parts of the world significant progress was being made in tuberculosis control just prior to the beginning of World War II. However, with the prosecution of the war in both Asia and Europe much that had been accomplished was soon dissipated. Most of the countries that entered the war attempted to prevent tuberculous individuals from engaging in military service. The X-ray was at its height of popularity, and military authorities in several nations believed that little or nothing need be done except to inspect the chests of inductees with X-ray. Unquestionably this practice screened out most persons with advanced pulmonary tuberculosis, but it missed large numbers with disease of lesser proportions. Some nations, particularly Canada, used the regular 14x17 inch films. Others used photofluorograms of various sizes. In the U.S. when the Selective Service system for induction into the army was established in Sept. 1940, only the conventional physical examination of the chest was used. However, in Oct. 1940 X-ray inspection was advised and funds were made available for contract work, but this phase of the examination was made universal only in the first three corps areas. It was not until the spring of 1942, after approximately 1,000,000 persons had been admitted to military service without X-ray inspection, that this phase of the examination was included at all induction centres. The army then adopted the 4x5 inch, and the navy the 35x35 millimetre photofluorogram, for routinely inspecting the chests of inductees. If shadows were seen on these microfilms, 14x17 inch celluloid or paper films were made. Those whose photofluorograms did not reveal shadows that appeared significant were regarded as having no tuberculosis and therefore were acceptable for military service.

Among approximately 18,000,000 persons seen at induction centres, 180,000 were rejected for tuberculosis, largely on the basis of X-ray shadows. Although it had long been known that various diseases of the lungs cast shadows with the same appearance as those produced by tuberculosis, nearly all of those seen at induction centres were regarded as representing tuberculous lesions, and a provision was made whereby persons with these findings were reported to the boards of health of their respective states. Thus, persons reported as tuberculous on the basis of X-ray findings included some with such nontuberculous conditions as pneumonia, abscess, fungus infection, etc., as well as some with tuberculosis. The only excuse for this limited procedure was that under the emergency of war there was not time at the induction centres to examine completely and determine the actual cause of the diseases which cast the shadows. It was assumed that if all were reported as tuberculous to state boards of health they would be contacted, and complete examinations would be made so that the actual diagnoses could be ascertained. In some places this was actually done, and it was found that from 10 to 14% of the rejectees had no evidence of significant lung disease. They apparently had acute infections, such as pneumonia, at the time of the induction examination and the lesions had promptly disappeared.

Follow-up studies of this kind in Detroit revealed that only about 10% of a group of more than 1,000 rejected for military service actually had tuberculosis which was in need of treatment. Of all persons rejected in three counties in Illinois this was true of only 4.4%, and among more than 4,000 rejectees from the entire state of Illinois, only 9.3%. In New York city about 37% of the rejectees were later found to have tuberculosis which was thought to require treatment. Information available in 1946 indicated that probably less than 25% of all persons rejected because of tuberculosis actually had active disease. This was a striking demonstration of the inability of physicians to determine either the cause of disease or its activity from a single X-ray shadow.

By the end of 1946, approximately 20,000 persons had been discharged from U.S. military service because of tuberculosis. These could not all be attributed to the war because many of them, probably the majority, were infected before they entered military service and would have fallen ill had they remained in their former communities. The disheartening fact was that, at least early in the war, approximately 60% of those discharged from service because of tuberculosis had shadows on their induction films which were entirely overlooked or regarded as insignificant. This again emphasized the inability of physicians to diagnose conditions within the lungs accurately from X-ray.

The most serious flaw in the examination for military service was the omission of the tuberculin test, which is much more delicate and accurate than X-ray, and all other phases of examination for tuberculosis. One reason for not including the test was that many persons still believed that nearly 100% of adults are infected with tubercle bacilli and therefore would react to the test. Another reason was that the war emergency did not permit time for administration of this test. This was somewhat paradoxical, how ever, since a serological test for syphilis was provided for every inductee. Probably less than 25% of inductees would have reacted to the test had it been administered, and the films of their chests could have been scrutinized more carefully, and thus the roentgenologist would not have missed so many who had unmistakable shadows at the time of induction. Moreover, the reactors to tuberculin should have been kept under close observation throughout the period of their military service, since it was from their group that most of the clinical tuberculosis developed, and often to advanced proportions before it was recognized.

The percentage of persons discharged from U.S. military service because of tuberculosis during World War II was about one tenth of that in World War I. Probably two factors were largely responsible for the difference: there was much more tuberculosis in the general population immediately before and during the first war; most of the advanced cases were rejected for military service in World War II because of the X-ray inspection of the chest; whereas in World War I much advanced disease was not detected at the induction stations.

Of those discharged from the army because of tuberculosis, about 90% had disease of the lungs and only 10% in other parts of the body. The tuberculosis rate for men more than 40 years was 8 times as high as that for those under 20 years of age. The number of persons who fell ill

in the army was approximately the same among those who were leading sedentary lives as among those engaged in strenuous activities of warfare. In the navy there was no apparent difference between the incidence of tuberculosis among forces afloat and those ashore. Apparently life at sea with its ofttimes arduous duties, naval engagements, etc., did not conduce to the development of tuberculosis any more than did life at a shore station. The army and navy established hospitals where those who fell ill from tuberculosis could be immediately treated, after which, if more treatment was advisable, they were discharged to veterans' hospitals.

There was no doubt that many engaged in the military services of the U.S. were infected and reinfected while in countries where large numbers of contagious cases of tuberculosis were in the general population. Since the tuberculin test was not employed, there was no way to determine when or where they were infected. Except for acute reinfection forms of the disease, such as pleurisy with fluid, there had not been time for clinical tuberculosis to develop among them. Undoubtedly this type of disease would appear among U.S. veterans for several decades as a result of the infections sustained while in service.

Tuberculosis Among War Veterans.—Tuberculosis had always been a serious problem among veterans of wars. In Canada following World War I, for each 100 veterans pensioned for wounds, 25 were pensioned for tuberculosis. Following World War I up to 1941, 1 U.S. veteran alive or deceased, of every 42 persons who served in that war was known to suffer from tuberculosis of a pensionable or compensable degree. In fact, claims were paid to the widows and dependents of 48,330 deceased World War I veterans. From July 1918 through June 1944, tuberculosis among such veterans cost the U.S. government \$1,422,545,000.

The total number of admissions of World War II veterans to hospital treatment for pulmonary tuberculosis from Dec. 7, 1941, to Feb. 28, 1946, was 23,600, of whom 16,100 were service connected. In 1946 there were 8,650 beds for tuberculous beneficiaries in operation by the Veterans administration in 14 hospitals for the tuberculous and in tuberculosis departments of 15 general hospitals. There were 775 additional beds for tuberculous patients in 22 neuropsychiatric hospitals. Plans were in progress for more beds, making a total of 14,600 by Jan. 1, 1948. The Veterans administration arranged for care of tuberculous veterans equal to that in any civilian sanatorium. Wherever veterans' hospitals were located near medical schools, affiliations were being established so that the appropriate members of the faculty were participating in the care of the veterans.

Tuberculosis Among Civilians During War.—It was still too early in 1946 to determine with exactness the extent of increase of tuberculosis among the civilians in most of the nations involved in World War II. However, enough information was available to justify the statement that it was large. There was an approximate 100% increase in the Netherlands from 1939-42, and in Greece the disease increased four and one half times. In Germany there was an increase of 24% during the same years. The mortality rate doubled in Yugoslavia, and a threefold increase occurred in Italy. According to estimates, there were about 36,000,-000 active cases of tuberculosis in China in 1946. Tuberculin tests administered to children indicated that 40% to 80% were infected in Poland and Czechoslovakia. In England between 1938 and 1941 there was an increase of 12.1%. Children up to 10 years of age showed a relative in-

crease of 50% in mortality from tuberculous meningitis. Many tuberculosis hospitals and sanatoriums were evacuated in Sept. 1939. The institution of blackout conditions interfered with ventilation and increased cross-infection. Evacuation of town populations to the country resulted in overcrowding as well as dissemination of large numbers of bovine type of tubercle bacilli through the dairy products, and contributed greatly to infection and reinfection with tubercle bacilli throughout England.

When World War II began, the examination of milk from individual herds in England showed that an average of more than 6% of all farms were sending out milk containing tubercle bacilli. Practically all bulk milk represented the mixed milk of 20 or more herds and, therefore, nearly all milk consumed was contaminated. Prior to the war, as much as 93% of the milk consumed in London was pasteurized. This was true of about 40 to 50% distributed in the aggregate of county boroughs, and about 15% was heat-treated in some other way. In the smaller towns very much less was pasteurized and practically none in rural areas. The Committee on Tuberculosis in Wartime of the Medical Research Council strongly recommended that, throughout the war, milk for human consumption be heated to a degree sufficient to destroy tubercle bacilli, which simply meant bringing it to the boiling point.

Such factors as dietary deficiency, physical and mental strain were long thought to cause increase in tuberculosis among civilians in time of war. In England during World War I there was considerable increase in tuberculosis among patients in hospitals for the mentally ill. This was thought to be caused by deficient diet. During World War II, however, special attention was paid to the diet of patients in such institutions, but tuberculosis definitely increased among them. The Committee on Tuberculosis in Wartime ascribed the increase in World War II not to diet, but to overcrowding in these institutions. The blackout was conducive to the dissemination of tubercle bacilli. Moreover, these patients did not suffer mental or physical strain more than during peacetime. The old idea that a run-down condition causes tuberculosis during peace or war was now open to question. In all probability, man had been deceived by the disease in this regard. Usually it is the tuberculosis which causes the run-down condition and which is not detected until it is in an advanced stage.

A. L. Barach observed two physicians who developed active pulmonary tuberculosis following repeated exposure to altitudes of approximately 42,000 ft. He believed that previous lesions were reactivated by local trauma to the lungs, caused when air or other gases expanded in the vicinity of the areas of disease. No evidence was produced to show that the usual altitudes attained in commercial air travel has any effect on tuberculous lesions.

Contrary to a general belief, it was shown that irritants such as chemicals and dusts, and bacterial infections like pneumonia do not influence the development of pulmonary tuberculosis or effect lesions already present. The only known exception was fine silica dust. It was formerly believed that persons with silicosis were almost certain to develop tuberculosis. Sander observed a sizable group of silicotics for periods as long as ten years and found that no more tuberculosis developed among them than in persons of the general population. However, when tuberculosis does develop in silicotics it often progresses more rapidly than among nonsilicotic individuals.

Only one factor had been established to account for an increase in tuberculosis among humans—contagion. Even though a nation might be conducting excellent tuberculosis control work in peacetime, it could be forced to relax

its efforts during war. Isolation of contagious patients was practically discontinued in wartime; sanatoriums were closed or used for other purposes; patients were sent back to their home communities where they disseminated tubercle bacilli to children and adults alike; stronger ones entered industry, while the weaker might be assigned to the care of children or other light work. In April 1942 Elizabeth Dechoff, a chest specialist in Dresden, Germany, found that approximately 60% of some 400,000 persons with open pulmonary tuberculosis, and 80 to 90% of those with stationary tuberculosis, were employed partly in unsuitable occupations. Doubtless the problem became even more serious in Germany and other nations during the last months of the war.

Unfortunately, the reports regarding increase in tuberculosis during World War II were based largely upon mortality and morbidity rates. These were not satisfactory criteria, as they provided no accurate information as to the number who became infected during the war or those who had the disease in the presymptom stage. Thus the increase in tuberculosis in such nations as Germany was much greater than it yet appeared. By the end of the decade 1937–46, there had not been time for infections sustained during the war to mature into chronic, ill-producing or life-taking disease. However, many of these would mature, so that illness and death in many persons during the following quarter of a century would result from infections incurred during World War II.

In the U.S. the mortality rate from tuberculosis did not increase during the war. Neither was there any evidence of increase in the number of persons ill from the disease. In fact, the mortality rate reached an all-time low of 39.7 per 100,000 population in 1945. Most of the sanatorium beds were kept in operation, and considerable searching was done in industry and elsewhere for contagious and precontagious cases in order that they might be prevented from disseminating tubercle bacilli. In spite of all this work, tuberculosis undoubtedly did increase in the U.S. as a result of the war. There was no doubt that large numbers of service women and men who went overseas became infected or reinfected with tubercle bacilli, and among them

a significant percentage would later have clinical tuberculosis as the result of those infections. (See also X-RAY.)

Tungsten

World production of tungsten concentrates, so far as data were available at the end of the decade 1937–46 from the important producers, is shown in Table I.

In order to cover a longer period, data are shown for alternate years previous to 1941. The extent to which production was built up in so many countries was one of the marvels of the World War II production program. The results in the U.S. were especially noteworthy since, so far as was known, the U.S. became the leading producer in 1944. In the earlier years of World War II, Portugal and Spain furnished most of the German supply, but later the buyers of the United Nations adopted the policy of outbidding the German buyers to reduce the German supply, thus accounting for the marked rise and abrupt fall of output in these countries. When the Burma road was closed

and it was necessary to fly war supplies to China, considerable amounts of tungsten were taken out on the return trips.

United States.—As a result of war demand and the discovery and development of new deposits, tungsten production in the U.S. rose to heights that a few years previously would have been considered fantastic. The peak of production was reached in 1943, with 11,945 tons of concentrate having a tungsten content of 5,736,000 lb., almost double the maximum attained during World War I.

In spite of heavy increases in consumption, production and imports not only maintained a satisfactory supply, but built up large stocks for possible emergency demand. Consumption almost doubled over prewar levels, and would have gone much higher except for extensive substitution of molybdenum for tungsten in tool steels. That this was an emergency substitution, and not a permanent trend in use, was made clear when restrictions on the use of tungsten were removed at the end of 1943. There was an immediate swing back to tungsten with a sharp decrease in the demand for molybdenum.

The new discoveries that supplied a large share of the increased output were largely marked out by the close of the war. This condition, combined with a tapering off of war demand, led to an abrupt decline in output in 1945. Imports declined even more sharply, the two barely meeting the consumption requirements.

With little left of the additional ore reserves discovered during the war, the postwar output was expected to be of the same order as that of the prewar years. The decrease of output in 1945 continued into 1946. Production of concentrates declined from 1,693 tons in the first quarter; the total for the three quarters was 3,297 tons, as compared with 4,371 tons in the same period of 1945. Imports declined from the 1945 level, with 5,429 tons in the first three quarters of 1946, against 7,122 tons in the same period of 1945. Consumption sagged even more, dropping from 12,961 tons to 4,354 tons in the first three quarters of 1945 and 1946, respectively.

China.—Chinese production of tungsten was greatly hampered by war activities, and even more so by shipping difficulties. However, even under these handicaps, exports of ore to the U.S. were maintained on a considerable scale up to 1945.

South America.—Outside China, South American countries were the chief sources of war supplies of tungsten. For over-all output during the war period, Bolivia headed the list, followed by Argentina, Brazil and Peru. Although Brazilian production did not get under way in any appreciable scale until 1943, it built up rapidly, and the total for 1943–45 was second to that of Bolivia. It is also to be noted that Brazil was the only producer in the list which did not show a decrease in output in 1945.

Axis Supplies.—German supplies of tungsten during the war years were chiefly from Portugal and Spain, with possibly small amounts from Sweden. These sources could hardly have supplied the amounts necessary for a war program of the size that was developed, especially since in the later years of the war much of the Portuguese and Spanish output was lost through preclusive buying by U.S. agents. It was reported that investigators going into Germany at the close of the war found considerable amounts of tungsten in reserve stocks, leading to the inference that emergency stocks of considerable size had been built up during the war.

Compared with Germany, Japan apparently was in a

better position as to supply, with eventual control of the outputs of Burma, Malaya, Indo-China, Siam and Korea. Indo-China and Siam were occupied without any great upheaval and it is probable that their relatively small outputs were not greatly disturbed. Burma had been a heavy producer and Malaya an intermediate one, but in the conquest of these countries most of their production capacity was presumably destroyed, and it was not known to what extent, if any, the production facilities were restored. However, the single available figure on Korean output after 1938 (11,194 short tons in 1945) leads to the inference that if supplies of any magnitude had been available from Burma and Malaya, it would not have been necessary to push the Korean output so high. (See also MINIRAL AND METAL PRODUCTION AND PRICES.) (G. A. Ro.)

Tunnels

Despite the years of World War II, when nonmilitary construction operations were greatly curtailed, the decade 1937–46 was one of the most important in tunneling history. During this decade the longest tunnel, by far, in the world was completed—the 85-mi. Delaware aqueduct for the New York city water suppply. In southern California another remarkable municipal water supply project was put into service, the Colorado river aqueduct to service Los Angeles and vicinity extending for 392 mi. across California from the Colorado river to the Pacific. Included in the aqueduct were 33 tunnels aggregating 18 mi. in length, the longest being 13.5 mi.

The longest ever driven from two portals only, without intervening shafts or adits was the Alva B. Adams water diversion tunnel under the continental divide in Colorado, a 9-ft. bore 13.1 mi. long. Colorado also claimed the speed record for driving a tunnel through hard rock. The 6-mi. Carlton tunnel, draining the deep gold mines of the Cripple creek district, was blasted out at the average rate of 50 ft. per day, with a top speed of 74 ft. per day, all from one portal, which made the achievement all the more remarkable.

Chicago got a good start on its subway system, the longest in the U.S. to be completely in tunnel (in contrast to the conventional "cut-and-cover" system of construction in New York and Philadelphia) with the completion of 7.7 route mi. of line involving 15.4 mi. of tunnel, of which the 3.7-mi. State St. link of twin tunnels was put into service. Wartime lack of track and signal equipment delayed opening of the Dearborn St. link, although work on this section was resumed. In Detroit the phenomenal speed of 50 ft. per 20-hr. day was averaged in driving a big sewer tunnel through soft clay with a shield. Primary lining of this bore was concrete blocks instead of the cast-iron or steel segments usually used for shield-driven tunnels, with a monolithic lining of reinforced concrete following close behind the shield. A new high record of 671/2 ft. in one day (20 hr.) for shield driving was established on this project.

An unusual tunnel project was completed in Pennsylvania on the Pennsylvania turnpike, a 160-mi. 4-lane superhighway. Here, out of the seven mile-long bores, six were enlargements of old headings partly driven 50 years before

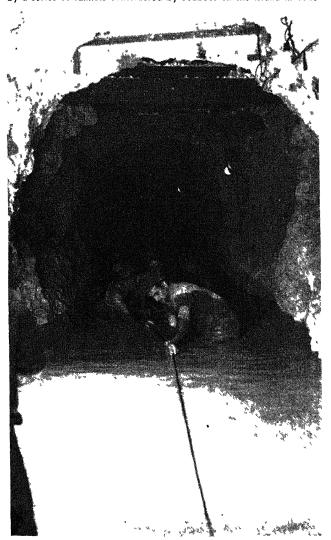

for the projected South Pennsylvania railroad, abandoned early in the construction stage.

The record for the fastest overall tunnel driving was set on the Charleston, S.C., aqueduct, where 18½ mi. of tunnel were driven in 7 months at an average of 500 ft. per day. The ground was ideal for tunnelling, a marl formation which could be mined with pneumatic spades, yet was firm enough to stand unsupported. The tunnel was attacked at 36 faces, two each from 17 shafts and one from each portal.

Largest of all tunnels in cross section driven during the decade was the connecting bore through Yerba Buena island between the east and west bay crossings of the San Francisco-Oakland bridge. Though only 540 ft. long, the tunnel had 58 x 76 ft. inside dimensions, carrying interurban and vehicle traffic at two levels.

One of the most spectacular methods of tunnel driving was developed on the Minneapolis-St. Paul intercepting sewers, lying in a white sandstone formation. The rock, standing hard and firm, had the peculiar characteristic of breaking down with a fine sand when disturbed. Instead of customary drilling and blasting the contractor on this project excavated the heading faces with high-pressure air jets and pneumatic chisels, then sluiced the resulting sand

Water supplies for the U.S. fleet based on Guam were provided by a series of tunnels constructed by Seabees on the island in 1945

into sumps with water jets. From the sumps, the mixture of sand and water was pumped along the heading and up shafts to the surface by special rubber-lined centrifugal pumps, which eliminated hauling and hoisting of the spoil. At the surface, the mixture was pumped into high bins, the water drained off, and the sand dumped into trucks for disposal.

Notable subaqueous vehicle tunnels were built under the Maas river at Rotterdam, Neth., at Mobile, Ala., and at New York city. At New York city, twin tubes were completed under both the Hudson and East rivers, and another pair was started under New York bay between Brooklyn and Manhattan. A vehicle tunnel started across the Thames Estuary below London became a war casualty, as did also Blackwell No. 2, at London.

Tunnelling in Europe was seriously interrupted by World War II. Because most tunnels were of military significance, censorship drew a veil over many projects that were under way or planned when hostilities broke out. In addition to the Thames and Rotterdam projects, a 7-mi. railroad tunnel in the department of Vosges, France, was completed. The short Bommerstein railroad bore was finished in Switzerland. The second and third sections of the Moscow subway were completed, and another, to encircle the six radial lanes of the first three, was started.

Elsewhere in the world tunnelling was relatively inactive during the decade. In Mexico, the 7-mi. Tequixuiac water tunnel was completed and the 7-mi. El Mirador irrigation bore was practically finished. The Cañon del Pato hydroelectric tunnel in Peru, 6 mi. long, was started. In Japan, a 2-mi. railroad bore under Kwammon straits, between Kyushu and Honshu, was placed in service.

Numerous tunnels became important military factors. Several extensions of London subways were started, to be used temporarily as air-raid shelters, later to be incorporated into the transportation system. Germany built extensive underground factories, laboratories and offices. Numerous tunnels in Japan, crude but effective, were built for underground aeroplane assembly plants and for ammunition, bomb and plane storage. Many tunnels in the U.S., especially those connected with water supply, were speeded up to serve rapidly-built war plants. In Hawaii, both the U.S. army and navy excavated large underground oil storage vaults.

Railroad construction, long a prolific source of tunnel projects, was practically dormant during the decade. The Northern Pacific replaced its half-mile tunnel at Bozeman, Mont., with a new bore, and the Denver and Rio Grande Western did likewise with its Tennessee pass tunnel under Colorado's continental divide. Relocation of the Southern Pacific around Shasta dam reservoir in California required 12 short tunnels, and the Chesapeake & Ohio built a new mile-long tunnel at Afton, Va. This completed the roster of new U.S. railroad tunnels.

Progress in Tunnelling.—The art of tunnel driving advanced steadily during the decade, despite the fact that new machinery development ceased with the outbreak of war. Perhaps most significant was the complete mechanization of small tunnel operations. Formerly all muck (broken rock) was usually loaded by hand into small cars. Drilling was done by hand-held drills or by larger drills mounted on columns or bars wedged against the tunnel walls and roof. With the introduction of small, but efficient overhead-loading type power shovels (known as mucking machines), hand loading no longer paid. Drill carriages, rail-mounted, carrying heavy drills strategically

spaced to cover the round of holes in the face, were produced in small size, and column-and-bar drill mounting became a rarity.

Drill carriages or "jumbos" became a universal rig on all tunnels, both large and small. Their development, along with better shoring and bracing systems, resulted in full-face mining operations on all sizes of tunnels. Formerly, in large headings, the customary procedure was to cut out the top half of the face ahead of the lower half, the so-called heading-and-bench method of driving. Drill carriages changed this slower method to full-face driving. The drills were mounted on salvaging arms at the front end of the carriage which, when the "jumbo" was pushed close to the face, enabled each drill to bore several holes without being dismounted. On some large tunnels, trucks were used to carry the "jumbos" instead of railroad cars.

The use of detachable bits for rock drilling also speeded up tunnel driving. Formerly the drill rods had to be heated in oil furnaces and then sharpened, which required the entire rod and its bit to be taken out of the tunnel, into the shop for sharpening and back to the heading. Detachable bits, which screw onto the end of the drill rods, could remain and be attached at the "jumbo," and only the small bit end needed to be taken out of the heading for sharpening. These bits could be resharpened by grinding or hot milling, and could be used over again five or six times. Pneumatic rock drills of the large or drifter type became automatic feed, thus eliminating the necessity of the drill runner's turning a hand crank to feed the drill rod into the hole. Dynamite and blasting accessories became efficient and safer.

Ventilation equipment greatly improved to make driving long headings safe and practical. Modern ventilating plants were so arranged that foul air could be exhausted from the heading, close to the face, following the blast. Then, by reversing the fans or by changing dampers in the pipe layout, the air stream could be increased to blow fresh air through the vent pipe while the men were drilling or mucking out.

Great advances were made in hauling and hoisting equipment, especially on the Delaware aqueduct. Occasionally, the contractor preferred to hoist loaded cars to the surface for muck disposal, but the customary practice was to install skips into which the muck was dumped at the bottom of the shaft. This method eliminated hoisting the cars. Mucking machines, both air and electric operated, became increasingly efficient.

Temporary support of ground during driving operations was greatly improved with the adoption of pressed-steel liner plates and steel ribs and posts for the timbering system, and liner plates curved to fit the tunnel contour were almost universally used to hold soft ground, especially in the U.S. They were essentially ribbed shallow pans, whose edges and ends bolted together in a solid sheet, though steel beams were often installed between adjacent rings of plates for additional strength and stiffness.

Concrete lining operations became largely mechanized. Collapsible steel forms, strong and rigid, easily moved and set up, speeded up this phase of tunnel work. Forms were available which permitted passage of muck trains through them, thus permitting concrete lining to proceed in one part of the tunnel while running operations continued at the face. Pneumatic placers, forcing concrete through a pipe into the forms with compressed air, became more efficient, and the concrete pump, accomplishing the same result by reciprocal action, became a common piece of equip-

ment. Placing the concrete mixer at the forms, so drybatched materials were hauled into the tunnel instead of wet-mixed concrete, was found advantageous. Where wet concrete was hauled to the forms, many ingenious arrangements were worked out for handling, including ramps and automatic car dumpers for charging the placing machines.

Safety in tunnel driving increased through the years. Good ventilation and lighting became requisites. Blasting accessories were made almost foolproof, and premature explosions became a rarity. Personal protection, such as hard-shell hats, rubber clothing and boots, reduced accidents. Acceptance of compressed air codes virtually eliminated the bends or compressed air illness.

Tests were made on addition of helium to the atmosphere of compressed air tunnels, to reduce the proportion of nitrogen, whose excess presence in the human body after locking out into free air results in the bends. Pure oxygen administered to the lungs after locking out proved beneficial. Improvements in haulage, hoisting and drilling equipment all promoted safety in the tunnel.

Projects of Outstanding Interest.—Tunnel driving is not a fixed and rigid procedure, such, for example, as building construction; it is uncertain and often difficult because the crust of the earth is highly variable and sometimes treacherous. A few examples of the more interesting projects of the decade 1937–46 will be cited.

A disastrous fire at the face of the north Manhattan heading of Queens-Midtown tunnel in New York, being driven with a shield under compressed air, burned through the timber face breasting during a Sunday shutdown. When the timbers burned out, the face collapsed with resultant flooding of the heading. Only after several barge loads of clay had been dumped into the river bed to partly seal the break could the heading be again placed under air and entered. The first crews to investigate the face entered through the top emergency lock in a small rowboat, and cautiously rowed their way through the dark along the top of the tunnel while the compressor plant raced at full capacity to maintain the delicate balance between inside tunnel pressure and outside river pressure. By working under water the men finally got the face sealed so the entire heading could be pumped out and tunnelling resumed, though three months' valuable time was lost in the disaster.

In the nearby south heading, the shield ran into large rock fragments dumped into the river bed from an old subway project, which made a porous face with resulting difficulty in holding the compressed air in the heading. The face was sealed with wet clay, then as workmen gingerly removed the rock fragments one at a time, others stood by with gobs of wet clay to seal the hole from which the rock came. Any slip-up in this procedure would have meant a blowout of the face and flooding of the heading.

In the San Jacinto tunnel in California a most elaborate installation of pumping equipment had to be made to take care of inrushes of water ranging as high as 10,000 gal. per min. After the tunnel headings at the foot of Potrero shaft repeatedly had been flooded out, a waterproof chamber was finally built to house seven pumps having a total capacity of 15,000 gal. per min., which could be controlled and operated from the surface when the tunnel was flooded.

In driving through New York's Hudson river silt, the contractor on the Lincoln tunnel adjusted the shield openings to admit only 20% of the displaced silt, shoving the remainder aside. The admitted muck was allowed to remain on the tunnel floor until shield driving was completed and the compressed air taken off. A flying gangway high on

the tunnel side carried railroad trains of liner segments and other supplies. After driving was completed, the muck was removed and concrete roadway building operations were carried on in a normal manner.

In the Maas tunnel at Rotterdam, concrete sills were placed under water in a dredged trench. Huge prefabricated tunnel sections, 81 ft. wide, 31 ft. high and 202 ft. long, were then floated to place and sunk. Hydraulic jacks in the walls, resting on the sills, levelled each section to correct position. The sections were joined inside a huge diving bell lowered from the surface.

Special ventilation equipment was developed for the 13-mi. Alva B. Adams tunnel in Colorado. Booster fans were installed at 5,000-ft. intervals in the ventilating pipe, so hooked up that they would start and stop in sequence rather than simultaneously. Thus, the column of moving air was treated as a hydraulic fluid rather than air. Also on this project was a signal block system, operated by electric eyes, which controlled movement of muck trains.

At Fort Peck, Mont., instant application of a bituminous sealing compound was necessary on all freshlyexposed faces of shale through which the big diversion tunnels were driven. If exposed to air for only a few minutes, the shale would slake and crumble, making it impossible to hold in place.

Extremely cold water flowing into the Leadville, Colo., drainage tunnel defied sealing off by usual cement grout methods; for the cement would not hydrate and set under the temperature conditions before the grout was forced out by water. The problem of sealing off water flows was solved by putting oats into the mix, which swelled upon becoming wet and

Turkey

The Turkish republic lies between the meridians 26° and 44° 48 min. E. of Greenwich and between the parallels of latitude 36°-42° N. Its area is 296,185 sq.mi. Ankara with a population of 226,000 (1940 census, 157,242) is the capital of the republic. Other principal cities are Istanbul, Izmir, Adana, Bursa, Eskisehir, Gaziantep, Konya, Sivas, Erzurum, Kars, Diyarbakir, Trabzon and Samsun.

The population of the country, according to the census of 1945, was 18,861,609 (1940 census, 17,820,950). Classification of the 1945 census had not been completed at the end of 1946, but according to the census of 1935 the proportion of the Turkish-speaking population was 90% and the proportion of Mohammedans was 98%.

Legal and administrative authority in the Turkish republic was vested in the grand national assembly, to be exercised by the council of ministers nominated by the president of the republic (himself elected by the assembly). The term of the presidency was set at four years, with the president elected from among the members of the assembly. Persons of either sex, on completion of their 22nd year, were given the right to vote. The elections for the assembly were required to be held every four years.

Between 1937 and 1946 the following were presidents of the republic: Kemal Atatürk (Oct. 29, 1923-Nov. 10, 1938), Ismet Inönü (after Nov. 11, 1938). The following were prime ministers: Celâl Bayar (Oct. 25, 1937-Jan. 25, 1939), Dr. Refik Saydam (Jan. 25, 1939-July 8, 1942), Sükrü Saraçoğlu (July 9, 1942-Aug. 6, 1946), Recep Peker (after Aug. 6, 1946).

Death of Atatürk.—The most important historical event in Turkey's domestic politics during the early part of the decade 1937-46 was the death of President Kemal Atatürk on Nov. 10, 1938.

Due honour was accorded by the nation to this unrivalled hero of the War of Independence for the idealism and courageous guidance he had shown in the introduction of great reforms. All civilized nations, regardless of past friendship or enmity, made Turkish hearts swell with pride by showing their admiration and respect for Ataturk. The whole world wondered how, after Ataturk's death, Turkey would develop in the social and political fields, but events proved once more the stability of the republic. On Nov. 11, 1938, the national assembly unanimously elected Ismet Inönu, premier during most of Atatürk's administration and the latter's chief aide, as president of the republic.

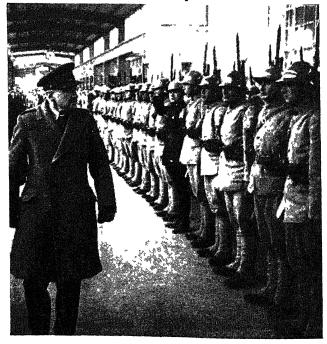

Policy of Peace. - The foreign policy of the Turk-

ish republic during the decade was based upon a sincere peace policy, genuinely devoted to the maintenance of good relations with its neighbours. The five-centuries-old struggle with Greece was brought to an end, and as desired by both parties, was superseded by a search for friendship and common security.

An atmosphere of good neighbourliness was created with Arab countries and Iran; Turkey's relations with Bulgaria were normal and very satisfactory compared with the latter's relations with other Balkan states.

Turkey's situation in 1937, as regards its relations with the great powers, could be summed up as follows: relations of good friendship continued with the soviet union. With Great Britain, no trace had remained of the enmity felt toward it all through the War of Independence, and a friendship that manifested itself conspicuously was established between the two countries. The Hatay question was the only cause of dispute between Turkey and France, and the relations between the two countries began to improve following the equitable solution of this problem. On June 23, 1939, a pact was signed at Paris together with an agreement by which France ceded Hatay (the sanjak of Alexandretta) to Turkey. Formal cession took place a month

British Gen. Sir James H. Marshall-Cornwall reviewing Turkish troops at Ankara in Jan. 1941, as the shadow of nazi aggression in the Balkans lengthened

later at Antioch. The relations between the Turkish republic and Italy varied from time to time. State visits were mutually paid, but the expansionist policy and the clamorous speeches of the fascist regime kept the Turks in a state of considerable uneasiness. Mutual confidence was lost altogether when, during the Ethiopian campaign, Turkey adhered to the decision of the League of Nations regarding the application of sanctions against Italy, and

openly supported the British view as well as the coercive measures suggested by Great Britain.

Until 1937, the relations of Turkey with Germany were mostly of an economic nature. As a result of the great economic crisis that began in 1929, Turkey like other countries had to resort to a planned economy in its trade with foreign countries, and the difficulties it encountered in procuring foreign currencies finally compelled it to establish commercial relations with Germany. Trade with that country was, therefore, of great importance to Turkey.

Relations with the U.S. remained cordial throughout the decade. Every ambassador who had represented the U.S. in Turkey since the first days of the republic expressed admiration and encouragement for the Turkish people's new way of life.

As a member of the League of Nations, Turkey worked fervently for the realization of collective peace, while supporting all such organizations as were designed to secure collective peace along its frontiers. Turkey, with Rumania, Greece and Yugoslavia, founded the Balkan Entente in 1934. The main object of the Entente was to safeguard the security of common frontiers and to try to win over Bulgaria, in time, as a friend, failing which the members of the Entente would take steps to neutralize that country.

But so far as the relations with the great powers flanking the outer borders were concerned, members of the Entente were under no obligation whatsoever, unless complications with Bulgaria arose. Reservations were even made by Greece and Turkey in respect of Italy and the soviet union respectively.

Moreover, should one of the members of the Entente get involved in single-handed war against Germany or Italy, the others remained free from any obligations.

Among the political combinations of the middle east, the Saad-Abad pact to which Turkey, Iran, Iraq and Afghanistan were parties, merited special attention. This pact was meant to bring about mutual aid and rapprochement in the political and social spheres by establishing friendship and good relations. It, however, did not contain any military clause to operate automatically.

Montreux Convention.-Of great importance for Turkey was the signature of the Montreux convention in 1936, which revised the straits regime imposed on Turkey by the treaty of Lausanne. The straits were demilitarized under that treaty and were opened to the warships of the Mediterranean states, provided that the tonnage did not exceed that of the strongest Black sea power. The soviet union did not ratify that treaty. But the convention of Montreux, duly signed and ratified by the soviet union, had recognized Turkey's right to fortify and defend the straits. Full freedom was recognized for merchant ships. As regards the passage of warships in peacetime, the ships of the Black sea powers could pass through without any restriction on tonnage; other powers could not, as a rule, have the right of passage for ships with an aggregate tonnage of over 30,000. In war, in the event of Turkey being neutral, the ships of belligerents would not be allowed to pass. If Turkey were a belligerent, or considered itself threatened by imminent danger of war, the passage of warships was left to the discretion of the Turkish government.

An annex was added to the Montreux convention (No. 2), wherein the essential points of the London Naval treaty of 1936 were incorporated almost identically; *i.e.*, the tonnage and characteristics of warships and auxiliary craft were specified. During World War II these descriptions were found to be insufficient. The fact that the period of 1937–38 was teeming with the portents of an imminent second world war was realized by Turkey.

Turkey attached importance to maintaining good relations with both the soviet union and Great Britain. The nation was anxious to avoid taking up a position between two opposing parties; the political situation after the Munich agreement of 1938 began to cause anxiety. But Turkey thought that this would give rise to no substantial difference in the stand taken by the soviets, Great Britain and France vis à vis the axis powers.

Early Phases of World War II.—The spring of 1939 occasioned great uneasiness in Turkey and in the Balkan countries. Germany and Italy had invaded Czechoslovakia and Albania respectively. Britain, having given up all hope of finding Germany trustworthy, was giving unilateral guarantees to the small powers exposed to aggression in eastern Europe. No such power excepting Poland, however, responded to the proposed guarantees. Certain small powers even went further and refused to accept them.

The republic of Turkey on the one hand and Great Britain and France on the other began to open negotiations with regard to mutual declarations of guarantee. These declarations made clear before the whole world the attitude of the signatories towards each other and were to be complemented by treaties of alliance. As soon as the negotiations on these declarations opened up, Turkey stressed at the very outset the necessity of co-operation with the soviet union and was convinced that Great Britain and France intended to co-operate with Russia as well.

Declarations were signed between Turkey and Great Britain and between Turkey and France on May 12, 1939, and June 23, 1939, respectively, but preparations for the treaty of alliance did not advance with the speed antici-

pated. Meanwhile the British and French delegations had gone to Moscow and had started negotiations with the soviet union.

Turkey was not aware of the real nature of the negotiations of 1939 between the soviet union and the western powers, but it firmly believed that the negotiations would be crowned with success.

The declarations aligning Turkey with Great Britain and France were received with great resentment by Germany and Italy. Through broadcasts and publications, grave accusations and threats were levelled against Turkey, and it was in such an atmosphere that the outcome of the negotiations among Great Britain, France and Russia was awaited. Then the cessation of the negotiations was announced, and the Russo-German pact of nonaggression was announced to a surprised world on Aug. 24, 1939.

When the Polish war broke out on Sept. 1, Turkey was disappointed at seeing the frustration of its wishes for cooperation and unity of policy between Great Britain and Russia. In Sept. 1939, while the war in Poland was still in progress, negotiations for a treaty of alliance between Turkey, Britain and France were resumed and proceeded quickly. According to this plan, Great Britain and France accepted the condition that Turkey should be supplied with military equipment to a certain agreed extent, and

Lend-lease shipment of U.S.-made bombs for Turkey being unloaded by Turkish troops in 1943

that it should not be dragged into armed conflict with Russia. Meanwhile the soviet union invited Turkish Foreign Minister Sükrü Saraçoğlu to Moscow with a view to concluding a treaty of alliance. The Turkish foreign minister informed the soviet union of the arrangements made with Great Britain and France, and stated that he would require the inclusion of a reservation concerning Great Britain and France in the prospective soviet treaty. Then, before signing the treaty with Britain and France, Saraçoğlu informed the latter nations that he was going to Moscow for a talk with the Russians, and that in the interest of his country's relations with both parties he wished to avoid the danger of hasty decisions.

Saraçoğlu arrived at Moscow on Sept. 25 and left on Oct. 17. The initial negotiations continued without a hitch, but before concluding a treaty of alliance the Russians asked for certain amendments in the plan drawn up with Great Britain. Turkey asked Great Britain and France to agree with the said amendments, which they did after lengthy negotiations.

Turkey therefore felt that the conditions for a treaty with the soviet union were all fulfilled. At that point the soviet union suggested an arrangement in its favour concerning the provisions of the Montreux convention, and it furthermore desired that a reservation regarding Germany be included in the treaty. After these points had been accepted, the U.S.S.R. stated that there would be one or two more points to be discussed.

In the face of this entirely new and unexpected situation, negotiations for the treaty were interrupted, and Foreign Minister Saraçoğlu left Moscow.

The Turkish, British and French treaty was signed in Ankara on Oct. 19, 1939. It became known through official speeches that the conclusion of this agreement displeased the soviet union.

The Year 1940.—After the fall of France, the Vichy government maintained its hold in Syria, taking up a position against Turkey, the ally of Great Britain. At the same time Rashid Ali launched a rebellion in Iraq.

Thus, Turkey had been isolated on its Syrian and Iraqi frontiers. The most important development for Turkey, however, was the very menacing political aggression of Germany. During the occupation of France, certain documents purporting to show the support of Turkey for French and British intentions directed against Russia were made public. France and Great Britain were dissatisfied at the delivery of materials to Germany in accordance with the Russo-German pact. The soviet union did not conceal its displeasure at Turkey's alliance with the western democracies. The Germans, when they published the French documents, were working zealously in a tense political atmosphere to create armed conflict between Turkey and Russia, and seeing Turkey isolated, they believed that, as was the case with Rumania, she would be drawn closer to them against an eventual Russian aggression. Turkey met these developments with calmness and tried to convince the Russians of the correctness of its policy toward them and the invalidity of the published documents, pending further developments. Contrary to German expectations, Turkey did not show any inclination whatever to side with the nazi government. On the contrary, after the Italian aggression against Greece in Oct. 1940, Turkey made known its position with renewed determination and

President Inönü, in a speech delivered to the national assembly on Nov. 1, 1940, made the following statement about Great Britain: "It is my bounden duty to state, that at a time when Great Britain is compelled to struggle gal-

Axis Ring.—The spring of 1941 witnessed the descent of the Germans into the Balkans and the occupation of Greece and Yugoslavia. Thus Turkey was surrounded on land and sea by Germany and Italy. The Germans did their utmost to come to the assistance of Syria and Iraq through Turkish territory, both by land and air, and every occasion gave rise to incessant and insistent démarches and negotiations. In April 1941, Turkey had mobilized its entire army and concentrated its forces in Thrace and on

lantly for existence under difficult conditions, the ties of alliance that bind us to her are sound and unshakeable."

through Turkish territory, both by land and air, and every occasion gave rise to incessant and insistent démarches and negotiations. In April 1941, Turkey had mobilized its entire army and concentrated its forces in Thrace and on the shores of the Aegean. The nation was waiting with resolution for its turn to come after the fall of the Balkan countries. Blowing up the bridges on the Meric river, it withdrew its forces in Thrace to defensive lines further to the rear. Such was the military situation, and yet Turkey categorically refused to comply with the German demands.

After the occupation of Rumania, soviet-German relations, which seemed to have been quiet for a period, assumed new activity during the winter of 1940–41. Soviet-Bulgarian relations during the months of Feb. and March 1941 were also active. After some soviet politicians had gone to Bulgaria in an official capacity, various anti-Turkish rumours were circulated in Bulgaria. In short, everything pointed to preparations for an attack on Turkey. Meanwhile the British were fighting in Iraq and Syria and were meeting with success.

At this juncture, the Germans made it known that they would not attack Turkey and then proposed a pact of friendship. Turkey declared that it would consent to this agreement with its far-reaching provisions on condition that the terms of the treaty of alliance with Great Britain were not prejudiced. The Germans accepted this condition. It was understood that the Germans had put off their attack on Turkey to a later and more suitable time; Turkey also considered it necessary to gain time both for its own security and for the benefit of its allies.

After the German invasion of the U.S.S.R., and during the various axis campaigns in Africa, Turkey steadfastly refused to give passage to the Germans. As a guardian of the Montreux convention, Turkey on the one hand did not allow the Italian fleet to pass from the Mediterranean to the Black sea, and on the other guarded its frontiers with all its forces against a surprise attack by land or by sea. While resisting German attacks, Russia and Great Britain were maintaining safe communications through the Arab countries and in Iran. They were using all their forces against the axis on the war fronts.

At the end of 1941, after the U.S. had been attacked and had entered the war, the three great Allies began to be interested in Turkey's position, and they were satisfied with its attitude.

Franklin D. Roosevelt had stated in Dec. 1941 that as the defense of Turkey assisted the struggle of the U.S., he would help Turkey with lend-lease. On Jan. 19, 1942, the soviet government, through its ambassador in Ankara, transmitted a message to the Turkish government that it was satisfied with the Turkish attitude and was of the opinion that this attitude of itself merited reward. The axis states in 1941 and 1942 had not been able to agree on their intentions toward Turkey. Italy found that the cause of all its disasters was the fact that the axis had not penetrated into Arab countries by land after overrunning Turkey. Japan was very anxious that the Indian ocean should be reached following the invasion of Turkey and urged that time once lost could never be recovered. In the days

U.S. marines from the U.S.S. "Missouri" at Istanbul. The battleship arrived in Turkey during April 1946, with the body of Mehmet M.
Ertegün, former Turkish ambassador to the U.S.

of El Alamein, it was understood that the handing of an ultimatum to Turkey was seriously considered. All these plans depended on one condition. It was necessary to pass through Turkey by force and in great strength, but the favourable moment had not arrived. The Turkish republic in the fourth year of the war, was still striving to protect its own territory against all eventualities and by means of its own unaided financial resources was already rendering services to the United Nations.

The Germans retreated from El Alamein and Stalingrad. The Americans landed in Africa (Nov. 1942), and so the axis tide began to recede.

Final Years of the War.—When, at the beginning of 1943, Winston Churchill visited Adana, he made it known that he appreciated Turkey's position. He had arrived from Casablanca after reaching a full understanding with Pres. Roosevelt. Churchill promised to supply Turkey with as much military equipment as it needed; Turkey had barred the road to further German expansion eastward. A vast program of armament for the Turkish army was to be elaborated and put into effect within a short time. In the coming phase of the conflict Turkey would decide for itself the time to enter the war.

The greatest service to the Allied cause during World War II was rendered by Turkey at the beginning of 1943. The Germans and Italians, now in control of the whole of Europe, had not been able to penetrate into the middle east. This was one of the principal factors influencing the outcome of the war, both from a political and military point of view The Turks were able to keep the road to

the middle east barred until the battles of Stalingrad and El Alamein were won, and North Africa was occupied by U.S. and British forces.

.The year 1943 witnessed the advance operations of the Allies in the Mediterranean and in the plains of Russia. At each meeting of leaders of the great powers, Turkey was among the subjects of discussion. It was decided at Tehran, at the end of 1943, to ask Turkey to enter the war, and this decision was communicated to Turkey. The Turkish president was invited to go to Cairo, where he discussed this subject with Roosevelt and the British prime minister. At Cairo, Turkey pointed out that it had been impossible to fulfil the armament program as set forth in 1943. Nevertheless, not insisting on the previous arms program, it agreed in principle to enter the war on the side of the Allies. Turkey demanded to be equipped with a minimum supply within the first two or three months in order to be able to cope with a probable combined German-Bulgarian attack, and asked that arrangements be made for joint operations and close collaboration.

A British military mission visited Ankara and discussed this subject at length. It found that it could not supply Turkey with the needed material.

The manner in which these conversations were conducted was most unfortunate. Turkey's entry into the war had already been discussed at Tehran and the discussions had been recorded, but what had been said and put on paper was kept secret. In Feb. 1944, the Ankara conversa-

tions failed to produce any results, and newspaper criticism started. The past five years had been forgotten.

In Aug. 1944, Great Britain and the U.S. asked Turkey to sever diplomatic and economic relations with Germany. Turkey acquiesced and even manifested an inclination to enter the war immediately. Great Britain made it clear that the first step toward Turkey's entry had been taken, and that when the proper time arrived it would request further action. It was understood that Turkey's participation, at this time, constituted a thorny problem between Great Britain, the U.S. and Russia. In Feb. 1945, at the request of Great Britain and the U.S., Turkey declared war against Germany and Japan. Turkey consequently became a member of the United Nations and was invited to participate in the San Francisco conference.

After Germany's Defeat.—Turkey's most important problem during the immediate postwar period was its relations with soviet Russia which, in March 1945, denounced the friendship and nonaggression pact existing between the two countries since 1925 and informed Turkey of its refusal to renew the pact. Russia announced to Turkey that this pact, which terminated in Nov. 1945, did not comply with prevailing conditions and required drastic alterations of its terms. Turkey agreed. What these new terms were was not made known for a long time. Finally, in June 1945 information was obtained regarding the terms in question, which caused great disappointment in Turkey.

In the meantime, Russia opened a war of nerves on the radio. No mention was made in May and June 1945 of the services rendered by Turkey to the Allied cause and of the sacrifices it had made during the war. Turkey did its utmost to weather with patience the storm of unfair and unwarranted accusations. In the summer of 1945, the Big Three decided at Potsdam to enter into conversations with Turkey regarding the revision of the Montreux convention. Great Britain and the U.S. made known their opinions and manifested a desire to revise the Montreux convention.

The soviets in their note of Aug. 7, 1946, also outlined their position. Expounding an essentially different point of view, they proposed that the straits regime should be discussed, to the exclusion of others, by the Black sea powers only, and that the defense of the straits should be undertaken jointly by Turkey and the soviet union. In a second note the Russians confirmed this. Turkey did not accept these demands; it contended that revision should be made in accordance with the procedure prescribed by the convention itself. (I. I.)

Turner, Richmond Kelly

Turner (1885-), U.S, navy officer, was born May 27, 1885, in Portland, Ore. A graduate of the U.S. naval academy at Annapolis (1908), he was commissioned an

ensign in 1910; he served on a number of battleships during World War I and after the armistice trained at the Naval Aviation school in Pensacola, becoming a naval aviator in 1927. He was commander of the Asiatic fleet's aircraft squadron (1928–29) and chief of the navy's bureau of aeronautics planning division (1929–31).

On July 1, 1935, he was promoted to a captaincy, and was assigned to the Naval War college. In 1940 Turner became director of the navy's war plans division and the following year he was promoted to the rank of rear admiral. Returning to active sea duty after the U.S. entry in World War II, he commanded amphibious forces that landed on Guadalcanal, Aug. 7, 1942.

Turner also commanded amphibious operations in the New Georgia, Kwajalein, Saipan and Iwo campaigns. He was made a full admiral on May 15, 1945.

Tweedsmuir, 1st Baron

Baron Tweedsmuir of Elsfield (1875–1940), British statesman, was born John Buchan in Perth, Scotland, Aug. 26, 1875. He was educated at Glasgow university and Brasenose college, Oxford, and after graduation was admitted to the bar in 1901. From 1927 to 1935 he was member of parliament for the Scottish universities. When he was appointed governor-general of Canada and raised to the peerage in 1935 he was one of the best known men of letters in Great Britain. Among his better known novels were *The Thirty-Nine Steps* (1915) and *Greenmantle* (1916); he also wrote several histories, including one of World War I. He died in Montreal, Feb. 11, 1940.

Twining, Nathan Farragut

Twining (1897-), U.S. army officer, was born in Monroe, Wis., Oct. 11, 1897. Graduated from the U.S. Military academy in 1919, he later studied at the Infantry school (1919-20). Leaving the infantry to join the air corps in 1924, he studied at the Air Corps Tactical school, 1935-36, and at the Command and General Staff school, 1936-37. Twining served in the South Pacific in the early days of World War II and was commander of the 13th air force in the Solomon Islands from July 25 to Nov. 20, 1943. During this period, his air force knocked out all the Japanese air fields on Bougainville, for which exploit he was awarded the Distinguished Flying cross. Sent to the Mediterranean theatre of war, he was made commander of the 15th air force in Italy, 1944-45, and on July 24, 1945, the army air forces announced that he had been made commander of the 20th air force in the Marianas. That same year, Twining was promoted to the rank of a lieutenant general.

After the close of World War II, Twining led a flight of three superfortresses in Oct. 1945 which completed a 13,167-mi. flight from Guam to Washington, D.C. (via India and Germany) in 59 hr. and 30 min.

Ukraine

The Ukrainian Soviet Socialist Republic is one of the constituent members of the Union of Soviet Socialist Republics. It is inhabited by the Ukrainians, a branch of the Slavonic nations, distinct in language, character and history from the Russians. Its area is 214,633 sq.mi. with a population (1939) of 30,960,221. Capital: Kiev (pop. 846,293). Other important cities: Kharkov (833,432), Odessa (604,223), Dnepropetrovsk (500,662). During World War II the Ukraine formed a decisive battleground in 1941 and in 1944.

For almost three years the land was under German occupation and suffered far-reaching devastation.

The Ukrainian Soviet Socialist Republic increased its territory in 1939 by the inclusion of parts of Poland extending to nearly 40,000 sq.mi. with a population of 7,000,-000. On the other hand, the Moldavian Soviet Socialist Republic, until then an autonomous part of the Ukrainian Soviet Socialist Republic, was constituted on Aug. 2, 1940, with the addition of large parts of Rumanian Bessarabia, into one of the constituent members of the Union of Soviet Socialist Republics and separated from the Ukraine. But the Bessarabian districts of Khotin, Akerman and Ismail, together with northern Bukovina, were incorporated into the Ukraine, which also gained in 1945 by the annexation of the Czechoslovak Carpatho-Ukraine, a territory of 12,617 sq.mi. with a population of 725,357. Thus for the first time all lands inhabited by Ukrainians were united in the Ukrainian Soviet Socialist Republic. Several of these lands like eastern Galicia (formerly Austrian and Polish), northern Bukovina (formerly Austrian and Rumanian) and Carpatho-Ukraine (formerly Hungarian and Czechoslovak) never before formed part of the Russian empire.

The Ukrainian Soviet Socialist Republic was admitted as a member to the United Nations organization in 1945 and participated in the United Nations Conference on International Organization in San Francisco. Chairman of the Ukrainian delegation was Dmitry Zacharovich Manuilsky, one of the well-known old bolshevik leaders and member of the former Communist international, and, in 1945, deputy chairman of the Council of People's Commissars of the Ukrainian Soviet Socialist Republic. (H. Ko.)

Umezu, Yoshijiro

Umezu (1882–), Japanese army officer, was born in Jan. 1882 at Oita. He attended the Japanese Naval academy and the Naval Staff college, graduating from both, but instead of making a career in the navy he joined the army as commander of an infantry regiment. He was later chief of military affairs and in 1930 was made a major general attached to the Military Staff board. In 1934 he was assigned to command of a Japanese garrison in north China and there directed many of the intrigues de-

signed to provide Japan with a legitimate excuse for invading China. In 1936, he was returned to Tokyo as vice-minister of war, but in 1939 was again shifted to the Manchurian scene where he held command of the Kwantung army and the title of Japanese ambassador. In reality, he was virtual ruler of the Nanking regime, then nominally headed by Wang Ching-wei. After Tojo's removal in July 1944 as chief of general staff, which post he held concurrently with his premiership, Umezu was appointed his successor.

To Umezu fell the task of signing, on behalf of the imperial general staff, the Japanese surrender document in the ceremonies aboard the U.S. battleship "Missouri" in Tokyo bay, Sept. 2, 1945.

Later he was taken into custody by the Allies and indicted for war crimes.

Union of Soviet Socialist Republics

The U.S.S.R., as the heir to the former Russian empire, is an Eurasian state which covers the whole of eastern Europe and northern Asia and much of central Asia. As a result of World War II it expanded its frontiers and above all its influence far into central and southeastern Europe and throughout the far east. Constitutionally it represents a federation of soviet socialist republics, the number of which varies with historical circumstance. It began with 7, and amounted in 1946 to 16. Actually the U.S.S.R. was held together by the strictly centralized Communist party which was the only party admitted in the U.S.S.R. and formed the core of the totalitarian structure of state and society.

The official head of the U.S.S.R. is the chairman of the praesidium of the supreme soviet. In that position Mikhail Ivanovich Kalinin was followed on March 19, 1946, by Nikolai Mikhailovich Shvernik. Prime minister (formerly chairman of the council of people's commissars): Generalissimo Joseph Vissarionovich Stalin, re-elected on March 19, 1946.

Vice-chairman of the council of ministers and foreign minister: Vyacheslav Mikhailovich Molotov.

In 1939, before the start of World War II, the area of the U.S.S.R. was 8,173,550 sq:mi. Its population, according to the census of Jan. 17, 1939, amounted to 170,467,186. The U.S.S.R. consisted then of the following 11 union re-

publics: Russian S.F.S.R. (Capital Moscow; area 6,372,860 sq.mi.; pop. 109,278,914); Ukrainian S.S.R. (Kiev; 171,777 sq.mi.; pop. 30,960,221); White Russian S.S.R. (Minsk; 49,022 sq.mi.; pop. 5,567,976); Azerbaijan S.S.R. (Baku; 33,196 sq.mi.; pop. 3,209,727); Georgian S.S.R. (Tiflis; 27,-020 sq.mi.; pop. 3,542,289); Armenian S.S.R. (Erivan; 11,-580 sq.mi.; pop. 1,281,599); Turkmen S.S.R. (Ashkhabad; 171,384 sq.mi.; pop. 1,253,985); Uzbek S.S.R. (Tashkent; 145,908 sq.mi.; pop. 6,282,446); Tadzhik S.S.R. (Stalinabad; 55,584 sq.mi.; pop. 1,485,091); Kazakh S.S.R. (Alma-Ata; 1,059,184 sq.mi.; pop. 6,145,937); Kirghiz S.S.R. (Frunze; 76,042 sq.mi.; pop. 1,459,301). The Russian S.F.S.R. was thus by far the largest (78% of the whole territory and 64% of the population). Of the remaining 36% of the population, almost one-half lived in the Ukrainian republic in 1939 (2% of the territory) and the other half in the nine other union republics (20% of the territory).

The last previous census in the U.S.S.R. had been held on Dec. 17, 1926, when the population was 147,027,915. Thus the increase during this period of 12 years and 1 month was 15.9%. But the largest increase was, according to soviet figures, in the first half of the period when the population increased by 18,700,000. In the following six years the increase amounted to about 4,700,000. This fall in the rate of increase was due to the famine of 1933–34 and to the heavy burdens of the five-year plan and of agrarian collectivization. According to the second five-year plan the population of the union should have grown to 180,700,000 by the end of 1937, including 134,600,000 rural population. The census of 1939 showed, however, only a population of 170,500,000, including only 114,500,000 rural population.

On the other hand, the increase of the urban population was vast. In 1897 the urban population of Russia formed 11.5% of the entire population; in 1926, 17.9%; in 1939, 32.9%. Table I shows that this increase of urban population took place throughout the union, even in territories formerly entirely rural or even nomadic.

Asiatic parts, with capital and skilled labour forces coming from the European part of the union.

The population of Moscow doubled in 12 years, and amounted in 1939 to 4,137,018. Ten other cities had a population of more than 500,000 in 1939 and showed an increase of one and one-half to three times during the 12 years. The cities were: Leningrad, formerly St. Petersburg (3,191,304); Kiev (846,293); Kharkov (833,432); Baku (809,-347); Gorki, formerly Nizhni Novgorod (644,116); Odessa (604,223); Tashkent (585,005); Tbilisi or Tiflis (519,175); Rostov-on-Don (510,253); Dnepropetrovsk (500,662). In 1939 there were 81 cities in the U.S.S.R. with a population of more than 100,000 inhabitants, 92 cities with a population of 50,000 to 100,000 inhabitants. Thirty-four cities showed in the period of 12 years a population increase varying from 3 to 10 times; Prokopevsk, Dzerzhinzk, Murmansk, Stalinabad, and Stalinsk increased by more than 10 times. Four cities totalling 459,000 inhabitants were newly built in the period between 1926 and 1939. They were Komsomolsk, Stalinogorsk, Magnitogorsk, and Karaganda.

The U.S.S.R. is inhabited by almost 100 different nationalities speaking different languages. The Slav element and the Slav languages prevail. The three branches of the Slav family living in the U.S.S.R. formed in Jan. 1939 78.1% of the population—the Great Russians 58.4%; the Ukrainians 16.6%; the Byelo- or White Russians 3.1%. None of the other nationalities, all of them non-Slavic and most of them non-European, reached 3% of the total population. The most important were Uzbeks 2.9%; Kazaks 2.8%; Tartars, 2.5%; Jews 1.8%; Azerbaijans 1.3%; Georgians 1.3%; Armenians 1.3%.

During World War II the U.S.S.R. had not only part of its economic productive capacity destroyed by military action and by the scorched-earth policy, but lost also an indeterminate number of its population. These losses were largely made up by new territorial conquests during World

The census showed a general displacement of population (1) to the Urals, Siberia and the far east, which received in these twelve years more than 3,000,000 migrants and increased in population by 33%, and (2) to the central Asiatic republics, which absorbed 1,700,000 migrants and increased in population by 38%. This migration highly increased the proportion of Russian elements in these Asiatic union republics. This trend of the spread of Russian and Ukrainian elements throughout the formerly non-Russian territories was increased during World War II. The war also accelerated the eastward movement of large-scale industry, which was continually and rapidly built up in the

war 11

Expansion.—In the years between 1939 and 1945 the U.S.S.R. expanded its territory considerably. At the beginning of the period it annexed in Europe the three Baltic republics of Estonia (18,353 sq.mi., pop. 1,126,413), Latvia (20,056 sq.mi., pop. 1,950,502) and Lithuania (22,959 sq.mi., pop. 2,879,070) and acquired from Finland 16,173 sq.mi. with a pop. of c. 500,000; from Poland 77,703 sq.mi. with a pop. of c. 12,775,000; from Rumania 19,300 sq.mi. with a pop. of c. 3,500,000. In 1945 the U.S.S.R. added to its territory the Carpatho-Ukraine from Czechoslovakia (12,617 sq.mi. with a pop. of 725,357) and the northern part of

eastern Prussia from Germany (c. 7,000 sq.mi. with a pop. of c. 1,000,000). From Japan the U.S.S.R. acquired in 1945 Karafuto (southern Sakhalin), an area of 13,935 sq.mi. with a pop. (1935 census) of 331,943, and the Chishima or Kurıle Islands (47 islands of 3,944 sq.mi.). Southern Sakhalin abounds in timber and petroleum; its most important industry is fishing. The importance of the Kuriles is strategic. In addition the formerly independent republic of Tannu-Tuva in Outer Mongolia (64,000 sq.mi.) was annexed and transformed into the Tuvinian autonomous region.

By a treaty of alliance with the national government of the Chinese republic on Aug. 14, 1945, the two main railroads in Manchuria, the Chinese Eastern railway and the South Manchuria railway, were to be joined into one railway system under the name of the Chinese Changchun railway, to be the joint property of the U.S.S.R. and China and to be jointly exploited by them. The managing director was to be a Russian. The important naval base of Port Arthur, which had been in Russian imperial control from 1898 to 1904, was to become a naval base at the exclusive disposal of the battleships and merchant ships of the soviet union and of China. It was to be administered by a commission of three Russians and two Chinese with the chairman a Russian. The Russian government alone was to be responsible for the defense of Port Arthur. The nearby port of Dairen was to become a free port in which the Russians would lease piers and warehouses and which would be administered by a soviet citizen. All these agreements were to run for 30 years.

The changes wrought by World War II in the size and composition of the U.S.S.R. and the lack of loyalty on the part of some of the peoples of the union brought about a reorganization of the federal structure. The following represents the composition of the U.S.S.R. at the end of 1946.

Reorganization.—The U.S.S.R. was reorganized during World War II into a federation of 16 republics. To the 11 republics existing in 1939 were added: the Karelo-Finnish S.S.R., consisting of the territory ceded by Finland and the former autonomous S.S.R. Karelia (cap. Petrozavodsk; area 75,656 sq.mi.); the Moldavian S.S.R. consisting of most of Rumanian Bessarabia and the former Moldavian autonomous S.S.R. (area 13,124 sq.mi.); the Estonian S.S.R.; the Latvian S.S.R.; and the Lithuanian S.S.R.; while the U.S.S.R. in 1939 comprised three European republics and eight Asiatic republics (three Trans-Caucasian and five

central Asiatic), in 1945 the federation included an equal number of European and Asiatic republics.

On the other hand, several former autonomous republics and regions in the U.S.S.R. lost their autonomy during World War II. The German Volga A.S.S.R., one of the oldest autonomous administrations in bolshevik Russia, was abolished after the German invasion, and its inhabitants dispersed into Siberia. Apparently the soviet authorities thought that the soviet citizens of German descent would be more influenced by their race than by their class allegiance, and proceeded with their transfer although the invading Germans never reached the territory of the for mer German Volga A.S.S.R. The four other abolished autonomous administrations were those of the Crimean Tatar A.S.S.R., of the Kalmyk A.S.S.R. with the capital of Elista, of the Chechen-Ingush A.S.S.R. around the important oil wells of Grozny in the Caucasus and of the Karachaev autonomous region around Mt. Elbrus in the Caucasus. All these four regions were occupied by the Germans during World War II. The termination of their autonomy was probably due to the disloyalty of the populations. What happened to the populations was unknown; the indigenous languages seemed doomed because the soviet government renamed all the towns with Russian names.

The Crisis of 1937-38.—At the beginning of the ten eventful years soviet domestic policy had apparently found a new stability. On Dec. 5, 1936, the eighth extraordinary all-union congress of soviets in Moscow had adopted a revised constitution. The solemn day was declared a public holiday throughout the soviet union. The constitution introduced universal and equal suffrage but it kept the totalitarian dictatorship intact. Stalin, its author, praised the constitution because it "preserved both the working class dictatorship and the dominance of the Communist party." Art. 126 of the constitution declared that "the most active and politically conscious citizens in the ranks of the working class . . . unite in the Communist party, which is the vanguard of the workers in their struggle to strengthen and develop the socialist system and which represents the leading core of all organizations of the working people, both public and state.'

The new elections were held one year later. In the fall of 1937, in all the cities and villages of the vast land, mass meetings were held, at which the candidates for the new supreme council were nominated unanimously by cheering

Inside Stalingrad during the six-month siege of the city which began in Aug. 1942

"Still No Fur Coat" was Orr's title for this cartoon in the Chicago Tribune as the German army faced its second Russian winter in 1942–43

crowds. No opposition candidates were presented, nor were any foreseen. The elections were an emotional demonstration of mass loyalty to the regime. With the help of the whole apparatus of propaganda, the Moscow government sought to insure a 100% electorate, to show the "foreign fascists and their agents that a united people stand behind the Red army." In fact, 96.8% of the approximate 97,500,000 franchised persons voted on Dec. 12, 1937, in the elections for the Supremem Countil. Naturally they all voted enthusiastically for the official candidates. The total number of deputies elected was 1,143. Among them were 184 women. Of the deputies 55% were officials of the party and of the government; 7½% members of the armed forces; 30½% workers and peasants; 7% "intelligentsia and illustrious citizens."

At the beginning of March 1937, in two speeches much commented upon, Stalin himself had subjected the increasing bureaucratization of the party to sharp criticism, and had demanded a closer contact of the party with the masses.

That the U.S.S.R., however, did not present a picture of unity and harmony was shown in 1937 and 1938 by the merciless extermination of real or supposed opposition elements. This purge hit equally all ranks, including the highest, of the party, the government, economic and industrial management, and the army and navy. All the accused were declared enemies of the people plotting against its security. In a number of trials an incredible situation was alleged to exist; most of the highly renowned followers of Lenin who for 20 years had been held up to the world as examples of socialism or communism were in reality persons of shabby character and complete unreliability.

The year 1937 began with a sensational trial against 17 leading communists, including Yuri Pyatakov, former vice-commissar for heavy industry, Karl Radek, mouthpiece of the Kremlin in foreign affairs, and Gregory Sokolnikov,

former ambassador to Great Britain who, according to the indictment, had sought on the instigation of Trotsky to overthrow the government in order to re-establish capital-15m in the U.S.S.R., and had promised to Germany and Japan, in exchange for their support, considerable territorial compensation (Ukraine, Amur territory) as well as great economic privileges and concessions. In order to hasten the removal of the soviet government, these communist leaders were said to have followed a policy of espionage, wrecking, and terror. All the accused fully admitted their guilt and made exhaustive confessions. On Feb. 1, thirteen of them, including Pyatakov, were shot; the remaining four, including Radek and Sokolnikov, were sentenced to periods of imprisonment ranging from eight to ten years. On March 5, Nıkolai I. Bukharin, former chief editor of the official Izvestia, and Alexei Rykov, former chairman of the all-union council of people's commissars, were expelled from the party for counterrevolutionary activities. Great excitement was caused then by the arrest at the beginning of April 1937, of the all-powerful Henry Yagoda, general commissar of state security, on account of the "discovery of criminal activity." On May 31, Marshal I. B. Gamarnik, the "basest and most dangerous Trotskyist," the first vice-commissar for defense, took his own life, and-a great shock for public opinion abroad-Marshal Mikhail N. Tukhachevsky, together with seven other highly placed men of the Red army, after a four-day secret trial by court-martial, were condemned to death and shot on June 12, having been found guilty of betraying military secrets to Germany, undermining the power of the Red army, and preparing a military defeat with a view to the partition of the U.S.S.R.

On Dec. 19, the shooting of eight more highly placed soviet officials, including L. M. Karakhan, former ambassador to Turkey, and A. S. Yenukidze, Stalin's one-time right-hand man and secretary of the central executive committee of the union, was announced. Also the religious revival, several times mentioned in the Russian press, called forth oppressive measures by the government against the clergy. The hunt for "enemies of the people and socialism," "traitors to the fatherland," wreckers, "agents of fascism" and spies was not, however, confined to the above-mentioned cases, but was carried out systematically throughout the union and operated in all departments of public, economic, and cultural life. The number of victims was not announced, but it was believed to have amounted to several hundred thousand.

The purges continued in 1938. In its first session in Jan. 1938 the supreme council elected Andrei Vishinsky as chief prosecutor of the U.S.S.R. (In the same session Mikhail Kalinin was re-elected chairman of the praesidium of the supreme council and Vyacheslav Molotov was appointed chairman of the council of peoples' commissars of the U.S.S.R.) Under Vishinsky the purge was directed with fanatical zeal against all who were suspected of Trotskyism. The name of the former closest collaborator of Lenin in the first years of the Russian revolution and of the consolidation of the bolshevik regime became now the generally accepted designation for everything regarded hostile or hateful by Stalin's regime. In the soviet press and over the soviet radio, which generally used language of unbelievable coarseness against political opponents or persons out of favour with the regime, no name was too vile, no accusation too fantastic, not to be repeated again and again against Trotsky and against most of the older leaders of the bolshevik party.

Greatest political mass trial of 1938, that of the so-called "right Trotskyist bloc," took place in Moscow before the military tribunal of the soviet supreme court from March 2 to 13. Of the 21 accused persons most were old bolsheviks and until recently leading figures in Russia, among them being Rykov, Nikolai Krestinsky, formerly assistant commissar for foreign affairs and ambassador in Berlin; C. G. Rakovsky, former ambassador in London and Paris; A. P. Rosengolz, former commissar for foreign trade and chargé d'affaires in London; Bukharin, Yagoda and others. All the accused—including Krestinsky after some hesitation—admitted their guilt and played up very well even to the most fantastic accusations of the prosecutor Vishinsky. Eighteen of them were shot. Rakovsky and two others were sentenced to terms of imprisonment ranging from 15 to 25 years.

Among the other more prominent victims of the sweeping purge in 1938 were Nikolai Krylenko, one of Lenin's old guard, himself till recently commissar of justice, accused of deliberately discrediting soviet law; and the 35 year old A. V. Kosarov, since 1926 secretary and leading spirit of the Young Communist league, "liquidated" in November together with two of his secretaries and two other members of the central committee of the league, on political charges of violation of democratic principles, bureaucratic practices, self-glorification, incompetence and lack of vigour in combating the soviet's enemies. Considerable personnel changes took place even in the higher ranks of the secret police, where many officials had been replaced by staunch supporters of the Stalin regime. And at the beginning of Dec. 1938, Nikolai Yezhov, chief organizer of the above-mentioned trial of the "right Trotskyist bloc," was forced himself to resign from his post as commissar for internal affairs and head of the secret police. He was succeeded by Lavrenty Beria, a Georgian like Stalin and the former party secretary for Trans-Caucasia.

In such a way was the ruling class of the country and the leadership in party, government, economics and the armed forces completely overhauled. Large scale terror and mass executions had been well known throughout the bolshevik regime; but in 1937 and 1938 they were for the first time directed not against "enemies" but against party members, even the most renowned and trusted collaborators of Lenin. Thus Stalin strengthened his hold on the party and on the country's leadership. The old bolsheviks were replaced by young men who had grown up under the Stalin regime and were regarded as moulded by it and completely faithful to it. It was only an outward sign of the structural transformation of the bolshevik regime and of the U.S.S.R. when Stalin, who since 1922 had been general secretary of the central committee of the Communist party, stepped into the full limelight of governmental and military office. He assumed the titles of marshal and later of generalissimo, and on May 7, 1941, was appointed chairman of the council of the peoples' commissars, a title later changed to prime minister, and people's commissar for defense.

The Third Five-Year Plan.—The second five-year plan ended on Dec. 31, 1937. It was declared a success for food and heavy industries, which were reported to have surpassed the official goal of the plan by 8 and 10% respectively. The year 1938 was the first year of the third five-year plan, the outlines of which, however, were not published until Jan. 1939. The last data about the progress of the plan were published in 1940, together with the expectations for 1941. As they were the last figures published

before World War II engulied Russia, they gave a picture of the economic development of the soviet union as viewed in the official soviet statistics. They are therefore of general interest

The number of workers and office employees engaged in national economy increased to 30,400,000 in 1940 as compared with 27,000,000 in 1937. According to the plan for 1941, the number of workers was to be increased to 31,600,000; 350,000 new students were to be enrolled in trade and railway schools and 537,000 in factory training schools. It was estimated that in 1941 industry would obtain 794,000 young skilled workers from factory training schools.

In the first three years of the third five-year plan, the industrial output of the U.S.S.R. increased from a value of 95,500,000,000 roubles in 1937 to 137,500,000,000 roubles in 1940, or by 44%, including an increase in the output of the machine building and metal working industry by 76%.

In 1940, despite the continuation of military hostilities with Finland at the beginning of the year, the value of the industrial output of the U.S.S.R. increased by 13,600,000 roubles, or by 11%, as compared with 1939, including an increase in the output of the machine building and metal working industry by 19%.

Foreign Relations before World War II.-During 1937 and 1938 the soviet union continued in its foreign policy to follow the line of rapprochement with the democracies a policy adopted after Hitler's rise to power in Germany. Nevertheless, there were frequent signs of Russia's turning towards a policy of isolation. Relations with Germany and Japan, which in Nov. 1936 signed a pact directed against the Communist International with which the U.S.S.R. was regarded as closely linked, continued to be very tense. The long-established direct air line between Moscow and Berlin was suspended in the summer of 1937. The U.S.S.R. actively supported the Spanish republican government, while Germany and Italy lent their aid to the Spanish rebel forces under General Francisco Franco. In 1935 the U.S.S.R. had signed mutual assistance pacts with France and Czechoslovakia, the latter contingent on the first.

On July 17, 1937, the U.S.S.R. signed a bilateral naval agreement with Great Britain, and reserved only special rights with regard to her far eastern fleet. In the middle of November, it was stated in the house of commons that the whole financial credit of $f_{10,000,000}$ granted to the U.S.S.R. by the British government in July 1936 had been utilized for purchasing British goods. On Aug. 4, 1937, after long negotiations, an important trade agreement was concluded with the U.S. by which the soviet union, in exchange for the granting of unconditional most-favoured nation treatment, pledged itself to purchase during the next 12 months U.S. goods to the value of at least \$40,-000,000. On July 29, a U.S. warship visited a Russian port, Vladivostok, for the first time since the revolution. On Aug. 21, China and the U.S.S.R. signed a five-year treaty of nonaggression, in which both pledged themselves "to refrain from any attack upon each other, whether singly or in conjunction with one or several other powers." The reported cooling in relations between Turkey and the soviets was contradicted at the time by the visits to Moscow of the Turkish ministers of the interior and foreign affairs in July. The signing of a new trade agreement with Turkey followed on Oct. 8.

The year 1938 brought several changes in soviet relations with the outside world. In his famous letter of Feb. 12 to a young communist, Ivanov, Stalin discussed the external tasks of communism. All foreign consulates within the soviet union were closed, and thus one of the last remaining avenues for some slight contact between the Rus-

sian people and the outside world was shut off. More and more even the few and tenuous ties which had been established between the two worlds (Russia on the one hand, and the non-Russians on the other) in the years between 1922 and 1937 were broken. At the beginning of 1939 Russia was a more jealously closed world in itself than ever in its history.

The Czechoslovak crisis strengthened these tendencies. The soviet union declared its determination to come to Czechoslovakia's help, if Czechoslovakia were attacked by Germany, and provided France did likewise. Soviet Russia was deeply distrustful of the efforts to conclude a four-power pact among Britain, France, Germany and Italy to stabilize conditions in Europe. Its exclusion from the pact of Munich which settled the fate of Czechoslovakia at the end of Sept. 1938 in no way lessened the growing antagonism between soviet Russia and the democracies

Relations with Poland, on the other hand, changed notably and significantly in the course of 1938 from mutual mistrust and elementary antagonism to a display of friendship. The summer brought an exchange of diplomatic notes about the surveillance to which officials of the soviet as well as of the Polish embassies in the respective capitals were subjected. On Sept. 23 Moscow gave Warsaw definitely to understand that the soviet union would at once denounce its nonaggression pact with Poland if the latter invaded Czech territory, which actually amounted to a veiled war threat. However, the issue of the Czech crisis, the disappearance of Czechoslovakia as an independent factor to be reckoned with in the immediate future in high politics, the danger of a further German expansion in a southeasterly direction, and the apparent plan of Hitler

Men and women of Leningrad hauling peat supplies in the beleaguered city. German encirclement of Leningrad was broken on Jan. 18, 1943

to use Czechoslovakia's eastern province of Carpatho-Ukraine as a kind of Ukrainian Piedmont for the formation of an independent greater Ukraine at the expense of Poland and of the soviet union, forced these two eastern states to revise their former policy and, as it seemed, not without success, to seek a rapprochement. On Nov. 26, after exhaustive negotiations, the conclusion of a Soviet-Polish agreement of friendship was announced in Moscow and Warsaw. On Dec. 21, 1938, after five days' preliminary talks with a Polish trade delegation in Moscow, it was agreed to increase 20-fold the former commercial turnover between the two countries.

At the beginning of 1939 Russia and Japan went through a period of strained relations. One of the reasons was the question of the lar eastern fishing grounds. On April 2 the existing fisheries agreement of 1928 was extended until Dec. 1939, but with Japan paying a higher rental for a smaller area than it had previously. Other disputes arose in connection with the Japanese oil concessions in northern Sakhalın. They were settled by an agreement on Aug. 12 with the Japanese-owned Northern Sakhalin Petroleum company. More serious were border clashes between troops of Russia and her satellite, Mongolia, on the one hand, and Japan and her satellite, "Manchoukuo," on the other. Early in 1939 there were mutual recriminations regarding the Japanese landing on an island in the Argun river, and a reported crossing of the Manchoukuo frontier by Russian troops; and there was some local fighting. There was also intermittent air fighting from May onward, accompanied by some infantry clashes, the most serious being occasioned by the reported crossing of the Outer Mongolian frontier southeast of Lake Buir by Japanese and Manchoukuo troops in July. On Sept. 16 an armistice was signed in Moscow providing for the immediate cessation of hostilities and for the setting up of a mixed commission to demarcate the frontier, and on Nov. 20 it was announced that an agreement had been reached by this commission.

When the German army, breaking the pact of Munich, occupied Prague and the remainder of Czechoslovakia in March 1939, the British government and the democratic peoples gained finally the definite impression that Hitler could not be trusted and that he was out for expansion into territory not inhabited by Germans. From that moment, Britain became the determined leader in the movement for the preservation of European peace against German aggression, and declared herself ready to guarantee any country threatened by that aggression. With the approaching struggle between Germany and the democracies. both sides began to try to win Russia as an ally in the forthcoming conflict. The future course of Russian policy seemed foreshadowed when on May 3, 1939, Maxim Litvinov was released from the office of foreign commissar which he had occupied since 1930. Litvinov had been a proponent of soviet collaboration with the democracies and with the League of Nations, as was his assistant commissar, Vladimir Potemkin. The change of policy became clear when Potemkin did not succeed his chief, and Molotov was appointed in his stead. Difficulties between the democracies and Russia arose when the latter demanded special guarantees for the Baltic republics which would bind them to the soviet union. The Baltic states themselves had refused such a guarantee, which they felt would compromise the strict neutrality they desired. Britain and France declared it manifestly impossible to impose a guarantee on small states against their will. Another question separating Russia and the democracies was the method of

support for Poland in case of German aggression. Poland demanded help through supplies and weapons, while Russia insisted on sending her armies into Poland for that purpose, an offer which the Poles did not think they could accept. In Aug. 1939 British and French military missions arrived in Moscow for staff talks regarding common actions against aggression, and political discussions were to be held concurrently with military conversation. They were still going on when the German foreign minister, Joachim von Ribbentrop, arrived in Moscow as the honoured guest of the Russian government and was cordially received by Molotov and Stalin. On Aug. 24, the Russo-German pact of nonaggression and friendship was signed for a duration of 10 years.

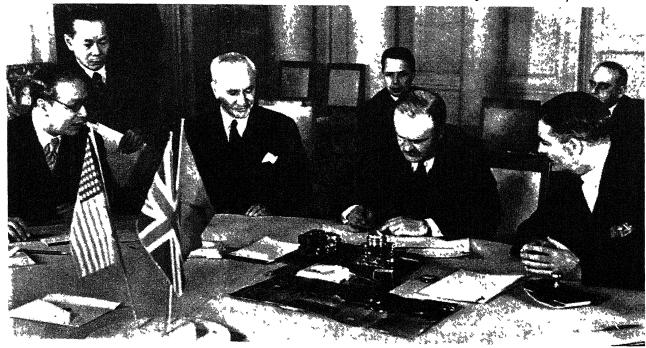

The pact encouraged Germany to proceed with war in the west. All anticommunist and anti-Russian propaganda in Germany came to an abrupt end, as did all antifascist and anti-German talk and action in Russia and among the communists and their friends all over the world. The two totalitarian states, Germany and Russia, were regarded as united against the "imperialistic capitalism of plutocratic states," as representing "proletarian, young and revolutionary" nations fighting against the exploiters. When Germany started World War II by her invasion of Poland on Sept. 1, 1939, the soviet union and its communist followers continued for two years to attack diplomatically, morally and propagandistically all the nations which resisted and fought German fascist aggression.

Moscow on the Sidelines of the War.—Russia's agreement with Germany in 1939 led to the absorption of a great portion of Poland and of the Baltic republics into the soviet union. Thereby the two great powers, Germany and Russia, were brought face to face along an extended frontier, and thus the danger of a fateful clash between them was hastened.

In spite of the Polish-Russian treaty of nonaggression, Molotov handed the Polish ambassador in Moscow on Sept. 16 a note to the effect that soviet troops were about to enter Polish territory. In a broadcast to the nation, Molotov explained this action by the fact that the Polish state and its government "had virtually ceased to exist," and that consequently all treaties with the Polish government were void. More interesting, because of the light which it cast on the soviet policy of that time, were the two other reasons given. The soviet government, it was said, could not remain indifferent to the fate of its "blood brothers," the Ukrainians and Byelorussians inhabiting Poland. Thus a theory of racial kinship, not of class allegiance, motivated the Red army in invading Poland and taking under its protection the Ukrainian and Byelorussian populations of eastern Poland. Secondly, the Russians wished to deliver the Polish people from the war into which their unwise leaders had plunged them. Thus the Poles were blamed for having offered courageous resistance to the demands and aggression of nazi Germany. On Sept. 29 Ribbentrop visited Moscow again. Poland was officially partitioned between her totalitarian neighbours, who jointly declared that they would consider Britain and France responsible for any continuation of the war for which there no longer existed any reason, and that they would consult together regarding the measures to be taken if the war were continued. An economic program was drawn up according to which Russia would furnish raw materials to Germany and thus help overcome any shortages caused by the British blockade.

At the end of Nov. 1939 soviet Russia called attention ominously to alleged frontier incidents on the part of Finland. Though Finland denied the incidents, the U.S.S.R. denounced the 1932 treaty of nonaggression between the two countries, and on Nov. 30 invaded Finland. The Finns fought with great heroism; the Red army was checked both in the sparsely populated north and on the strongly fortified Karelian isthmus—everywhere save in the Petsamo region. The difficulties of a winter campaign, and,

Foreign Commissar Vyacheslav Molotov of the U.S.S.R. signing the Four-Power Pact of Moscow, terms of which were announced Nov. 1, 1943. Others seated at the table, left to right: Fu Ping Sheung, Chinese ambassador to the U.S.S.R.; U.S. Secretary of State Cordell Hull and British Foreign Minister Anthony Eden

in particular, the valour, equipment and fortifications of the Finns, had evidently been underrated by the soviet authorities. Not till Feb. 1940 did they establish the superiority in numbers, artillery and aviation which enabled them to effect a break-through on the isthmus, leading to the peace treaty (signed March 12, 1940) which transferred to Russia approximately 16,175 sq.mi. of Finnish land and lakes with an original population estimated at 450,000. The new frontier ran from west of Viipuri along a line roughly coinciding with that laid down at the Peace of Nystad between Peter the Great and Sweden (1721). In the north the region of Kuolajarvi and the Fisherman's and Middle peninsulas were ceded to the U.S.S.R., together with transit rights to Norway and to Sweden. Moreover, the U.S.S.R. obtained a 30 years' lease of the Hangö peninsula which was of utmost strategic importance. These peace terms considerably restricted Finland's ability to resist Russia in case of future misunderstandings or further demands; but though much heavier than the original terms, they were lighter than those canvassed by the U.S.S.R. at the outset of the war.

The violation by the U.S.S.R. of the Soviet-Finnish non-aggression pact and the general sympathy for a weak and profoundly democratic neighbour evoked much opposition to Russia in the European democracies and in the U.S.A. Diplomatic relations with Britain and France became strained to the utmost, and the League of Nations excluded the U.S.S.R. from membership and called for help for the victim of aggression. The soviet union countered by invoking the necessity of security. Having settled with Poland and Finland, the soviet union turned to the Baltic republics and to Rumania.

Early in the fall of 1939 Estonia, Latvia and Lithuania had been requested to send their foreign secretaries to Moscow, where they signed pacts of mutual military assistance and ceded to Russia certain naval and air bases and the right to maintain "strictly limited soviet forces in them." On Oct. 31 Molotov declared soviet Russia's respect for the independence of the three Baltic republics. But with the collapse of France in June 1940, Russia presented ultimata to the three Baltic republics, soviet troops occupied them, and "friendly" new left wing governments were set up. The new regimes arranged for the election of national assemblies following the methods of the soviet union. These national assemblies unanimously voted to liquidate the national independence and to join the soviet union on July 21, 1940.

Meanwhile, on June 26, Molotov demanded from Rumania within 24 hours the cession of Bessarabia, which had formerly been a part of the Russian empire, and northern Bukovina, which had never been under Russian domination. The Rumanian government agreed to surrender the two provinces. Thus, in the first 10 months of World War II, the U.S.S.R. had gained a territory of about 170,000 sq.mi. (almost double the area of Britain) and more than 20,000,000 inhabitants. The economic importance of these gains was of course overshadowed by their strategic significance. On Aug. 1, 1940, Molotov made the following statement on the Russian-German pact: "This agreement . . . has done away with the possibility of friction in the application of soviet measures of security along our western frontiers, at the same time guaranteeing to Germany tranquillity in the east. The course of events in Europe has not only not weakened the pact of nonaggression between the U.S.S.R. and Germany but on the contrary it has underlined the meaning of its existence and further development."

But German-Russian relations were soon to be strained

by the conflicting interests of the two nations in the Balkans. Molotov's visit to Berlin in Nov. 1940 did not clear away the causes of possible friction. When Germany began her active expansion into Bulgaria, Yugoslavia and Greece, the soviet union repeatedly expressed opposition.

When the Japanese foreign minister, Yosuke Matsuoka, visited Berlin, Rome and Moscow in the spring of 1941, his presence in Moscow on his return journey was used for the conclusion of a Russian-Japanese pact of friendship and neutrality on April 13, to last for five years if not renewed. By this pact Russia gained Japanese neutrality in case of involvement in war with Germany; on the other hand, Japanese action was diverted by the pact to expansion towards the south. Such a course might involve Japan in a war with the U.S.-which would weaken U.S. help to Britain and be fatal to Japanese power in the long run-and might weaken decisively the European position in Asia, a goal long pursued by the soviet union. Stalin showed his great satisfaction with the pact by the unusual gesture of bidding farewell to Matsuoka personally at the time of his departure from Moscow.

On May 6, 1941, the praesidium of the supreme soviet nominated Stalin president of the council of the people's commissars. A few days later the soviet government took an unprecedented step to express its sympathy for the German point of view. It withdrew recognition from the governments of Norway, Belgium and Yugoslavia, though these governments legally still existed, and closed their legations in Moscow. In June, when Britain and the U.S. warned the soviet union of an impending German attack, the official Russian news agency Tass stigmatized these warnings as "absurd and hostile propaganda spread by forces hostile to Russia and Germany."

On June 22, a Sunday, in the early morning hours, German troops crossed the soviet border without any warning and attacked the soviet union. Italy, Rumania and Hungary followed the German example, while Finland, in spite of statements of intended neutrality, allowed itself to become involved in the war. On that fateful day of June 22, in the evening, Prime Minister Churchill made his historic broadcast in which he put the might of Britain behind the soviet union in its life and death struggle with the German invader.

The U.S.S.R. at War.—The German attack caught Russia by surprise and partly unprepared, as did the Japanese attack on the U.S. at Pearl Harbor. In the first night of the invasion the German air force destroyed many of the first-line soviet planes on the ground. The German armies poured victoriously over the frontiers and penetrated deep into soviet-held territory. The annexation of the buffer states by the soviet union and the expansion of her frontiers did not provide much help for the soviet union. The Russian armies were deleated everywhere, immense numbers of Russian war prisoners were taken, the Ukraine was occupied by the Germans, and at the beginning of December German armies stood before Moscow. (For details of the German campaign in Russia, see World War II.)

On June 30 the soviet government had announced the formation of a state defense council consisting of Stalin, Molotov, Beria, Malenkov and Marshal Voroshilov. On July 11 this council appointed Marshals Voroshilov, Timoshenko and Budenny commanders respectively of the northwestern, central and southwestern sectors of the front; for some time Timoshenko acquired a good reputation as a military leader, but eventually all three were

replaced by new and more successful men. On July 20 a government decree appointed Stalin defense commissar in place of Marshal Timoshenko, and in Aug. 1942 General Zhukov, commander in chief of the central front, was appointed Marshal Stalin's chief deputy as commissar of defense. On July 17, 1941, the office of political commissar in the army (which had been abolished in Aug. 1940) was reintroduced. In view of the extreme gravity of the position on the central front, most of the government departments, together with the foreign embassies, were moved in October from Moscow to Kuibyshev (formerly Samara) on the middle Volga.

On Dec. 8 the Germans retreated from their advanced positions before Moscow. An unexpectedly early winter, reputedly more severe than for a whole century, caught the Germans unprepared for its hardships and inflicted great sufferings on the German army. It afforded Russia time for a reorganization and re-equipment of the army and gave Britain and the U.S. the opportunity to pour into Russia huge quantities of badly needed planes and tanks, armaments and supplies, which helped to make Russian survival and ultimate victory possible. Yet the year 1942 witnessed further German advances. The German high command abandoned the idea of a frontal attack on Moscow. It tried to conquer Leningrad in the north, and the German armies spread out throughout the south, conquering the Don basin and the northern Caucasus and approaching the Volga at Stalingrad and the oil fields of Grozny. The turning point came at the end of 1942 with the heroic defense of Stalingrad. At the same time Field Marshal Montgomery's British armies defeated the Germans at El Alemein and drove them back across Italian North Africa; and U.S. and British armies landed, under the command of General Eisenhower, in North Africa. Early in 1943 the sixth German army at Stalingrad surrendered to the Russians; at about the same time the long siege of Leningrad was raised; and during 1943 the Russian armies regained much territory and recaptured the cities of Smolensk and Kiev. While the western Allies invaded Italy in 1943 and France in 1944, the relentless Russian offensive pushed westward, across the Russian borders and into the axis capitals, into Bucharest and Budapest, Vienna and Berlin. Almost four years after Germany attacked the U.S.S.R. the war came to an end with the complete defeat of Germany and her satellites. (See World War II.)

Internal Development during World War II.—The years of the war with their immense sufferings and privations and their heroic efforts and legendary deeds stirred the soviet people deeply. As far back as the middle of the thirties, the intellectual climate in the soviet union had begun to change. A new emphasis had been put on conservative forces in complete opposition to the radical tendencies of the first decade of the revolution. The importance of family and marriage, of strict discipline in schools, and authority and rank in the army was now stressed. In its beginning the revolution had regarded marriage and divorce as private affairs. Now abortion, formerly favoured, was made heavily punishable; marriage ties were strictly enforced and highly praised; the raising of big families was promoted by exhortation and rewards; divorce was frowned upon and made practically impossible by protracted court procedure and exorbitant fees. The emphasis on internationalism, entirely dominant in the first period of the revolution, relaxed. Instead, patriotism was preached and the soviet fatherland glorified. Marxist historiography after 1917 had rejected and vilified the Russian past as a

dark age of feudal and Tsarist reaction and of religious bigotry and oppression. In the '30s this interpretation of history was officially declared wrong; its writers were persecuted. The Russian past was re-interpreted; the great Tsars, especially those who had ruthlessly waged war for the expansion of the Russian empire and had suppressed all tendencies of liberty for the sake of the unity of the nation, were highly praised, and the church was recognized as an important element in building the Russian nation In 1939 the antireligious propaganda officially ceased.

When the actual war began in 1941, these tendencies gained the upper hand. The emotional forces of Russian history and nationalism were put fully into the service of the defense of "the sacred soil of the fatherland." The soviet fatherland now gave way to the Russian fatherland; attachment to the Russian past and to the Russian soil became the favourite theme of Russian poetry and of the Russian stage. The war fought by the soviet union was not called a war for socialist revolution or for a better world order; it was called a "war of national liberation," the "great patriotic war," a name which it shared with the war of 1812 when the Russian empire had successfully withstood the invasion of Napoleon and had, with the help of its allies, pursued the defeated enemy into its capital. The heroes of the Russian past were put up as examples for the soviet youth; they were not revolutionary fighters, liberals or socialists, but feudal lords and saints of the church, Tsarist generals and aristocratic conquerors of revolutions and mass uprisings. Prince Alexander Nevsky, who had defeated the Germans in the Middle Ages and was a saint of the Orthodox church; Count Alexander Suvorov, the great Russian general who had suppressed the uprising of the Russian masses under Pugachev in rivers of blood, who had dealt the death blow to Polish independence and almost to the French revolution and its armies; Count Mikhail Kutuzov, who had led the Russian army in the name of its Tsar against Napoleon in 1812: they were the most widely invoked names in Russia during the war. Holy Russia and the Russian common folk, the Russian peasant, again entered the centre of soviet thought and feeling. The great and ruthless Tsar Ivan the Terrible was glorified on screen and stage and was regarded as Stalin's ancestor as empire builder.

The Russian Orthodox church was recognized as one of the most important elements for strengthening the Russian state and the Russian aspirations. In Nov. 1942, on the occasion of the 25th anniversary of the bolshevik revolution, the metropolitan Sergei of Moscow wrote a letter to Stalin which was published in the whole soviet press: "In the name of our clergy and of all believers of the Russian Orthodox church, true to the spirit of our fatherland, I heartily and with blessings greet you, the God-chosen leader of our military and cultural forces who is leading us to victory over the barbarous invaders of our peaceful and blossoming country, and to a bright future for this nation." This metropolitan Sergei was officially installed as patriarch of all the Russias on Sept. 12, 1943.

In the Russian army the old titles, gold braided uniforms and class privileges of the Tsarist officers were reintroduced. There were few armies of World War II in which the officer class was as privileged as in the Red army, in which discipline was so strictly enforced, and military etiquette, especially saluting, so highly emphasized. The same tendency showed itself throughout the educational system. In all elementary and secondary schools coeducation was abandoned because it was declared that the aims of education were different for the two sexes: boys were to be educated to become soldiers, girls had to look for-

ward above all to future motherhood. In July 1944 increased government aid for expectant mothers and parents of large families was introduced. Mothers of large families were granted honourary titles and special medals. Military drill and military games were made compulsory for the children and the youth in the country.

To these changes corresponded the dissolution of the Communist International on May 22, 1943. The famous monthly Communist International which had been founded by Lenin in 1919 appeared for the last time in July 1943. It was replaced by War and the Working Class which after World War II changed its name to New Times. On March 15, 1944, the revolutionary song "The Internationale," written by a French revolutionary, ceased to be the official anthem of the soviet union. The new national anthem, written in Russia, glorified the mighty homeland and the great Stalin.

On Feb. 1, 1944, the republics constituting the U.S.S.R. were authorized to enter into direct diplomatic relations with foreign states and to form and maintain their own commissariats of foreign affairs and of defense. However, the direction of their foreign affairs and of their armed forces, and the financing of them, would rest in the future exclusively with the central authorities in Moscow. Thus no practical changes were introduced. Yet the new arrange-

*1939. †1942.

ment proved to be useful in foreign relations. On the strength of it the soviet union could claim additional representation in international bodies.

Economic and Living Conditions.—The first years of the war were chiefly occupied behind the front in rapid development of industry at new centres beyond the Volga. It was a winter of grave sacrifices for the civilian population, especially in cities in or near the front line like Moscow and Leningrad and Sevastopol - sacrifices borne with heroic fortitude. It was a winter of enormous efforts on the production front by workers in the key industries, both near and distant from the battle zone. The blow which the German advance aimed at some of the most important industrial centres of the country was to a large extent parried by the evacuation of key factories from the threatened areas to sites in the new industrial districts around Kuibyshev on the Volga, in the Urals, or farther east still in Siberia. This was an evacuation of both the personnel (with their families) and the equipment of whole factories by a railway journey of sometimes

1,000 mi. or more. In its planning and organization as well as in its dimensions this evacuation was extraordinarily impressive, as was also the speed and efficiency with which new sites were prepared for the "leapfrog" factories, as they were called (often temporary structures of timber to economize in steel). The buildings to house them in some cases were already completed by the time the evacuated plant and personnel had arrived.

The economic losses suffered from the German advance, especially from the occupation of the Ukraine, were very serious, especially in the raw materials of heavy industry and in basic products. With the loss of the Ukraine went between one-half and two-thirds of the soviet union's prewar output of coal and iron ore and pig iron, and nearly half of its prewar steel output. The Dnieper region was an important centre of aluminum production, of ferroalloys and of rolled steel. With the German advance to the Don and into the north Caucasus in the summer offensive of 1942, more than half of the former wheat production and about 40% of rye production was lost to the U.S.S.R. More than half the pigs and more than a third of all cattle were in territory overrun by the invaders.

The soviet position in engineering was considerably bet-

ter; probably not more than one-fifth of the prewar soviet capacity lay in areas occupied by the Germans. Moreover, engineering plants, even heavy engineering, were generally easier to evacuate than blast furnaces, so that a larger proportion of equipment was probably capable in this case of being salvaged and removed. The same was true of the nonferrous metal industry and of the most modern armament plants, most of which were located in the newer industrial centres east of the Volga. More than two-thirds of soviet lead, zinc and nickel, and nearly all the chrome, copper and cotton came from the eastern part; and even in the case of aluminum a new plant in the Urals was under development at the outbreak of war, based on newly exploited bauxite deposits on the eastern slopes of the range. Large tungsten and tin deposits had recently been discovered and opened up in eastern Siberia, and synthetic rubber plants were in the unoccupied zone. Even in the case of oil, although in 1940 the Caucasus region accounted for about 30,000,000 out of 34,000,000 metric tons, there was a rapidly developing and rich new area between the Urals and the Volga called "the second Baku" which was scheduled to produce 7,000,000 tons by 1942 and might have exceeded this figure. The Urals are especially rich in minerals, which had been rapidly developed. Kusbas, 1,000 mi. farther east, had iron ore, manganese and coal.

Light industries seem mostly to have gone to the Volga region and also factories making grenades and shells; for example, this was apparently the destination of most Moscow factories, some of which were evacuated completely, while others evacuated part of their machinery and staff to form the nucleus of new daughter factories. The Urals became a centre of tank, artillery and aircraft manufacture; and Kusnetsk of machine tools and the production of high grade steels. The latter centre at the end of 1942 was in a position to meet three-quarters or more of its ore requirements from adjacent mines, while the Urals were able to overcome their previous coal deficiency by drawing supplies from the rich anthracite region of Karaganda along the newly built railway from Karaganda to Magnitogorsk. A new wave of the Stakhanovite movement,

known as the "thousand per-centers" of workers, who themselves took the initiative in multiplying their normal output standards many times by improved methods of working, did a great deal to augment the capacity of plants. Strenuous efforts were made to train new labour supplies, especially women, by training courses in the factory and by a system of patronage by Stakhanovites and skilled workers over newcomers.

About a third of the population of the U.S.S.R. lived in the occupied regions at the end of 1942. Of the urban population a large proportion, probably more than half, was evacuated eastward; but the proportion of the rural population evacuated must have been much smaller. Somewhere between 30,000,000 and 50,000,000 persons must, therefore, have been living in the occupied zones, many of them serving as guerrillas, harassing the German lines of communication. The plight of this population was even more grim than that of other German-occupied countries of eastern Europe. Not only were they subject to pillage and starvation on a scale quite unprecedented in modern warfare, but they were victims of a concerted campaign of terrorism and extermination to which it was hard to find a parallel since the middle ages. Virtual serfdom to German overlords was introduced into the villages on the ruins of collective farming; thousands of men, women and girls were transported under compulsion to Germany as slave labour. In Nov. 1941 Foreign Commissar Molotov, on behalf of the soviet government, issued his first note to the world powers, protesting against the barbaric treatment of Russian prisoners by the Germans. On April 27, 1942, the Moscow radio announced a new note by Molotov, charging the German government with a premeditated policy of atrocity, which included wholesale plunder of occupied territories, complete destruction of whole villages with their populations, introduction of slave labour and serfdom for workers and peasants, forcible transfer of civilians to Germany and their treatment as prisoners of war; extermination of prisoners by torture and starvation, and mass execution of soviet citizens regardless of position, age or sex. The note declared that the soviet government had documentary proof that these were not merely isolated cases of brutality by individuals or undisciplined units, but acts committed on instructions from the German high command.

With the German retreat from the Kuban and the Don regions, the problem arose of restoring not only communications but civilian life in the ravaged and depopulated areas. With the soviet offensive of the late summer of 1943 liberating half the Ukraine, the problem acquired high priority on the agenda of immediate tasks. Rebuilding was undertaken largely in the form of temporary wood structures, rapidly assembled from prefabricated parts, transported from regions where these could be mass-produced. A good deal of attention was paid to improvised and novel building methods. A special research institute in industrial building at Moscow introduced numerous innovations in wood, concrete and stone construction, in the use of substitutes for cement and brick, and in the extended utilization of three-ply boarding. A parallel institute concerned with house building experimented with "orgalite" building blocks made from waste paper, with building blocks made from slag and with aluminum-foil coatings for walls in postwar building. A special decree of the council of people's commissars outlined in considerable detail immediate measures to be taken for the restoration of national economy in the districts liberated from the Germans.

By May 1944 the "first-aid" phase of restoration of towns liberated in 1943 seemed to have been completed. Essential buildings and factories had been partially repaired or rebuilt, and public utilities were in operation. A high proportion of the population had returned. Towards the end of 1943, 300,000 people lived in Kharkov (Jan. 17, 1939: pop. 833,432). On the anniversary of its liberation (Feb. 2, 1944) the population of Stalingrad numbered 250,-000 (Jan. 17, 1939: pop. 445,475). Plans for the layout of the cities showed some common features: Stalingrad, Kharkov, Rostov and Sevastapol would include green belts, a wide boulevard leading into a main square with a victory monument, etc. Railway stations were to be placed outside the city. Emphasis was placed on the use of local building materials. Production of prefabricated houses had begun. Reconstruction in the Ukraine proceeded apace. The greater part of the power stations was restored.

In Sept. 1945 the fourth five-year plan was announced. As in former plans, the emphasis was on heavy capital goods, steel production and armaments, especially also on a great increase in navy and naval bases. Labour productivity and industrial efficiency were to be improved as a condition "for expanding the soviet economy and developing its great new frontier" in Asia. To fulfil the requirements, the competitive methods in wages and other incentives known to capitalistic society were developed. Russia also intended to become an export centre of machines for all the countries in eastern and southeastern Europe where Russia wished to replace Germany as the chief supplier of industrial goods. At the same time new constructions were to continue to shift eastward beyond the Urals; from these Asiatic centres Russia could supply the markets of Asia.

Consumers' goods continued to be subordinate to the production of heavy capital goods. Yet the soviet government hoped to raise slowly the very low standard of living of the Russian people to the much higher standard of the masses in the democracies. Efforts were made to meet the constantly rising demand for better living conditions, and by the end of 1946 there had been a noticeable improvement in the food situation and in the supply of consumers'

goods. Living conditions were eased. The eight-hour working day was restored and the payment of increased wages for overtime was reintroduced. The special war tax on workers was repealed on Jan. 1, 1946—a saving of about 15% for the worker.

Throughout the soviet union the reconstruction of the devastated provinces was progressing with great energy. Production increased in all fields. Of decisive aid was the great help given by U.N.R.R.A. to the Ukraine and Byelorussia. U.N.R.R.A.'s vast supplies prevented starvation in western Russia and made reconstruction possible.

Foreign Relations during the War.—The German attack of June 1941 and the new war in the Pacific occasioned considerable diplomatic activity in Moscow, London and Washington; the new alignments which followed Churchill's declaration of assistance to the soviet union on June 22, 1941, were in some respects quite startling. On July 13 the Anglo-Russian pact of mutual assistance was signed. A week later the soviet government resumed diplomatic relations with the émigré governments of countries occupied by Germany, and on July 18 a soviet-Czech treaty of mutual assistance was signed by the Russian ambassador in London, Ivan Maisky, and the Czech foreign minister, Jan Masaryk, providing for mutual aid and support in the war against Germany, and for Czech military units to be formed on soviet territory under the soviet high command.

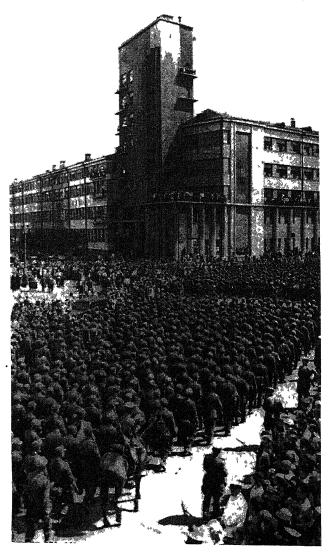

On July 30, 1941, Harry Hopkins arrived in Moscow as the personal emissary of President Roosevelt to Stalin. On Aug. 16 there followed an Anglo-Soviet trade agreement under which Britain extended an initial credit of £10,000.

"E Pluribusky Unumovich." The reaction of Darling of the New York Herald-Tribune to the soviet union's decision on Feb. 1, 1944, to permit each of its 16 constituent republics to establish its own army and maintain separate diplomatic representatives abroad

000 to the U.S.S.R. at 3% for five years. On Sept. 26 an exchange of letters took place between Maisky and General Charles de Gaulle in which the soviet government extended recognition to the Free French government and promised the latter full aid and support. On Aug. 10 the British and soviet ambassadors in Ankara presented identical declarations to the Turkish foreign office, confirming their fidelity to the Montreux convention and assuring the Turkish government that they cherished "no aggressive intentions or claims whatever with regard to the Straits," were "prepared scrupulously to observe the territorial integrity of the Turkish republic," and would render Turkey every help and assistance in the event of its being attacked by a European power. In view of German intrigues in Iran, British and Russian forces jointly entered Iranian territory on Aug. 25, 1941, and on Sept. 17 reached Tehran, the capital. Both Britain and Russia pledged scrupulous respect for Iranian independence and territorial integrity and the complete evacuation of the country after the war. On Sept. 28 Lord William Beaverbrook and W. Averell Harriman, representing the British and U.S. governments respectively, arrived in Moscow for a three-power

German prisoners, captured on the Russian front, marching through Moscow in 1944 en route to a permanent soviet prison camp

conference on supplies, and on Oct. 3 it was announced that the U.S.A. and Great Britain had agreed to send large war supplies to the U.S.S.R.

In Nov. 1941 Maxim Litvinov was appointed Russian ambassador to the U.S.

The final weeks of 1941 witnessed the visit of the British foreign secretary, Anthony Eden, to Moscow, where in a series of meetings with Stalin and Molotov there took place an "exhaustive exchange of views on questions relating to the conduct of the war and postwar organization of peace and security in Europe," in the course of which "identity of views" was reached between both parties. On his return to England, Eden was accompanied by the soviet trade union leader, Nikolai Shvernik, with a soviet trade union delegation, to pay a return visit following that of Sir Walter Citrine and British trade unionists to Moscow a few months before. Six months later, Eden was able to inform the house of commons of the signature of a new treaty of alliance, collaboration and mutual assistance between Great Britain and the U.S.S.R., extending over a period of 20 years. This was signed in London on May 26, 1942, following the arrival of Foreign Commissar Molotov in England five days previously and a series of what Eden described as "long and friendly exchanges of views with Molotov," in the course of which "complete mutual confidence was established." Three days after the signature of the treaty, Molotov arrived in Washington, where he stayed at the White House as guest of President Roosevelt. The first fruit of these Washington conversations was the signature on June 11, 1942, of a "master lend-lease" agreement by Cordell Hull and Ambassador Litvinov. On the same date General Wladyslaw Sikorski, head of the Polish government, issued a statement welcoming the British-Soviet treaty.

The chief clauses of the historic Anglo-Soviet treaty provided that the two countries should undertake to afford one another military and other assistance and support of all kinds in the war against Germany and all those states associated with it in acts of aggression in Europe; affirmed that "the high contracting parties undertake not to enter into any negotiations with the Hitlerite government in Germany that does not clearly renounce all aggressive intentions, and not to negotiate or conclude except by mutual consent any armistice or peace treaty with Germany or any other state associated with her in acts of aggression in Europe," and declared the desire of both countries "to unite with other like-minded states in adopting proposals for common action to preserve peace and resist aggression in the postwar period, . . . to work together in close and friendly collaboration after the reestablishment of peace for the organization of security and economic prosperity in Europe," and "to render one another all possible economic assistance after the war." The foreign office statement which accompanied the announcement of the treaty stated that "full understanding was reached between the two parties with regard to the urgent tasks of creating a second front in Europe in 1942."

On Feb. 25, 1943, the foreign affairs committee of the Polish national council had issued a declaration that "from the moment of the conclusion of the Polish-Soviet treaty of July 30, 1941," they had "maintained the unchangeable attitude that so far as the question of frontiers between Poland and soviet Russia is concerned the status quo previous to Sept. 1, 1939, is in force." While the committee thus insisted on the territorial integrity of Poland, for which Poland and its allies had gone to war with Germany, it repudiated any hostile intentions toward the U.S.S.R. and denied that the Polish government harboured

Prime Minister Churchill, President Roosevelt and Premier Stalin with members of their advisory staffs at the conference near Yalta in the Crimea during Feb. 1945

any designs to extend Poland's eastern frontiers to the Dnieper and the Black sea. The soviet news agency replied that the declaration bore witness to "the fact that the Polish government refuses to recognize the historic rights of the Ukrainian and White Russian peoples to be united within their national states." On April 12, 1943, the German news agency announced the discovery near Smolensk (in the Katyn district) of mass graves of 10,000 Polish officers whom they alleged had been killed by the Russians in 1939, an announcement characterized by the soviet information bureau as a "vile fabrication." On the other hand the Polish government issued a statement calling for an investigation into the Katyn graves by the International Red Cross. The International Red Cross declined to act in the matter. The soviet press proceeded to charge General Wladyslaw Sikorski's cabinet with "swallowing a carefully baited hook thrown out by the German propaganda agencies"; and on April 25 Foreign Commissar Molotov handed a note to the Polish ambassador, Tadeusz Romer, severing diplomatic relations with the Polish government on the ground that "the recent behavior of the Polish government with regard to the U.S.S.R." was "entirely abnormal and violated all regulations and standards of relations between two allied states." This was followed by a statement by Andrei Vishinsky to representatives of the British and U.S. press, attacking the Polish government but denying that the soviet authorities had any intention of forming another Polish government on soviet soil, and accusing representatives of the Polish embassy of having conducted espionage activities in the U.S.S.R. under the guise of charitable activities. Six days later, on May 13, Moscow announced the formation of a body known as the Union of Polish Patriots in the Soviet Union, which published a declaration of aims in the paper called Wolna Polska, including the following: "to help the Polish people under German occupation to achieve their liberation; to wage war side by side with the Red army against the enemy; to strive for the independence and sovereign rights of the Polish state and its parliamentary and democratic structure, and for the material and cultural well-being of Poles in the U.S.S.R.; and to strengthen the bonds between the soviet and Polish peoples." On the same day the formation of a Polish division-the Kosciusko division-on soviet soil, under the command of Colonel S. Berling, was announced.

In Oct. 1943 the foreign ministers of the U.S.S.R., Britain and U.S.A. met in Moscow. Their meeting was followed in less than a month by a conference of Stalin, Churchill and Roosevelt at Tehran, Iran, Nov. 28-Dec. 1, 1943. This long-expected meeting of the "Big Three" resulted in a declaration, dated Dec. 1, in which the three powers pledged mutual assistance "in the war and in the peace that will follow . . ." and concerted action to bring about the final destruction of all German armed forces.

No mention was made of Japan; a separate statement guaranteed independence and postwar economic assistance to Iran. (For details of the Moscow, Tehran and subsequent conferences, see International Conferences, Allied [World War II].)

Other diplomatic events in the course of 1943 included the recall of Ivan Maisky as ambassador in London, following his appointment as a deputy commissar for foreign affairs, and his replacement by Fyodor Gusev, who had previously been appointed first soviet minister to Canada in Oct. 1942; also the recall of Maxim Litvinov as ambassador extraordinary to the government of the U.S.A. and his replacement by Andrei Gromyko, who had already acted as chargé d'affaires at the soviet embassy in Washington. On June 21 Constantine Oumansky, formerly soviet ambassador in Washington, presented his credentials to the president of Mexico as first soviet ambassador to the Mexican government; while Alexander Bogomolov, soviet ambassador to the Allied governments in London, presented his credentials to King Peter of Yugoslavia on June 8, 1943.

The problem of Poland and a crisis in Soviet-Iranian relations created considerable difficulties between the great powers in 1944. Chances of a reconciliation between the U.S.S.R. and the Polish government, never very bright, faded toward the end of 1944. When in January of that year the Red army was about to enter Poland, the U.S.S.R. proposed the acceptance by Poland of a frontier based on the Curzon line and compensations in the west at Germany's expense. The Polish government would not accept this proposal, and an offer of mediation by the U.S. was rejected by the soviet government. When soviet forces were approaching Lublin, the soviet government declared it had no further territorial aspirations in Poland-outside the eastern Polish provinces annexed in 1939-and did not intend to change the social order of that country. It recognized the Polish committee of national liberation, and the Byelorussian, the Ukrainian and the Lithuanian S.S.R. concluded agreements with the committee concerning an exchange of population (Sept. 9 and 22). The Polish prime minister, Stanislaw Mikolajczyk, visited Moscow twice. His second visit, undertaken when Churchill was in Moscow (Oct. 1944) raised some hopes of a settlement which, however, were dashed upon his resignation (Nov. 24). On Dec. 31, 1944, the Polish committee of national liberation was declared in Lublin the provisional government of Poland. Further inter-Allied difficulties arose in consequence of a demand for an oil concession in northern Iran made by S. I. Kavtaradze, U.S.S.R. deputy commissar for foreign affairs, in Tehran in Sept. 1944. In reply the Iranian government pointed out that its constitution forbade the granting of concessions while the country was occupied by foreign troops and therefore asked to postpone the granting of all oil concessions until after the war. This led to bitter criticism of the Iranian government in the soviet press, and to significant demands for a "friendly" government in Iran.

A soviet delegation headed by Andrei Gromyko, U.S.S.R. ambassador in Washington, took part in the Dumbarton Oaks conference (Aug.-Sept., 1944). The conference proposals were welcomed by the soviet press, which, however, considered that the whole structure of the organization would be undermined if a great power should not be allowed to vote in a dispute to which it was a party. (See United Nations.) The Franco-Soviet treaty of alliance and mutual assistance was signed during General de Gaulle's

"Mr. Red Chips Goes to Town," as Plaschke of the Chicago Herald-American pictured soviet foreign policy in 1945

visit to Moscow on Dec. 10, 1944. Drawn on the lines of the Anglo-Soviet treaty of 1942, its obligations of mutual aid in the event of German aggression were immediate and automatic. It referred to the United Nations organization, but did not state, as the Anglo-Soviet treaty did, that the parties did not seek territorial aggrandizement and would not interfere in the internal affairs of other states.

After World War II.-Victory found the Russian troops in occupation of large parts of Germany and Austria, and of the former German satellites, Rumania, Bulgaria and Hungary. In these countries, as well as in Poland, Yugoslavia, Albania and Czechoslovakia, regimes came into power which were regarded as friendly to the soviet union. In Yugoslavia, Poland, Rumania, Bulgaria and Albania, these regimes were under communist control. The soviet union maintained large armies of occupation, probably as a consequence of the domestic food situation, for the armies lived largely on the occupied lands. In Asia the soviet union concluded a favourable treaty with China which gave Russia economic and strategic positions of importance in Manchuria. Russia did not support officially the Chinese communists in their struggle with the Chinese government; it gave correct support to the legitimate government. Russia also occupied the northern, highly industrialized part of Korea and claimed a share in the occupation and control of Japan proper. Much international concern was caused by Russia's claims on Turkey and Iran, where Moscow apparently tried to realize the far-reaching aspirations of the former imperial government which revolutionary Russia in 1918 had officially and solemnly repudiated. From Turkey Russia demanded-on the strength of "historical rights" of Georgians and Armenians for which soviet scholarship and propaganda were mobilized in characteristic fashion-vast territories in eastern Anatolia and bases on the Straits of Constantinople, while in Iran the Russians were believed to favour autonomous and perhaps even separatist movements in the north which might lead either to the disintegration of Iran or to the establishment of a friendly government under soviet control over the whole of Iran. The principle of national self-determination was invoked in the case of the Iranian Azerbaijani and Kurds to foster Russian aims. Russia's demands on Turkey and Iran threatened to keep the tensions with the democracies acute.

With the defeat of the common enemies, the wartime alliance of the soviet union, Great Britain and the U.S. was subjected to much strain. This was the result not only of opposite ideologies but of conflicting national interests and security requirements. Nevertheless, co-operation among the Big Three was maintained. They met during 1945 in not less than four conferences. In the first two (Yalta in the Crimea and Berlin [Potsdam] in Germany) the heads of the three nations conferred. At Yalta Marshal Stalin met with President Roosevelt and Prime Minister Churchill; at Berlin, where again the Russians were hosts in their zone of occupation, Marshal Stalin met with President Truman, and it was during that conference that Prime Minister Attlee replaced Churchill. As a result of the decisions of the Berlin conference the foreign ministers of the Big Three met in London in Sept. 1945. When this conference ended without agreement, the foreign ministers met again, at the suggestion of the U.S. secretary of state, at Moscow in December. Their partial agreement there smoothed the way for the opening of the United Nations assembly in London in Jan. 1946. But there, as in the succeeding conferences of the foreign ministers in Paris in 1946, opposite ideologies and interests clashed again and little progress was made towards the writing of peace treaties with the defeated enemies.

At the United Nations conference in San Francisco in the spring of 1945 the soviet union was represented by a delegation under the leadership of Foreign Commissar Molotov. In addition to the U.S.S.R., two of its constituent republics, the Ukrainian S.S.R. and the Byelorussian or White Russian S.S.R., became members of the United Nations organization and were represented at the United Nations conference. The U.S.S.R. did not join, however, some of the international bodies organized in connection with the United Nations like the educational and food organizations. Nor did it ratify the Bretton Woods agreement. (See also International Conferences, Allied [World War II]; United Nations; World Political Alignments, Postwar.)

Conflict with Democracy.-Much of the international tension could be explained by the lack of communication between the soviet union and the democracies. The U.S.S.R. and the territories occupied by its armies were on the whole inaccessible to outsiders. Travel in these territories was discouraged as was travel of soviet citizens abroad. U.S. and British press representatives in Moscow complained about the restrictions imposed upon their work in gathering and transmitting information. Thus the split of the world into two regions was increased by the soviet unwillingness to allow any contact similar to that existing between other nations and civilizations in the modern world. The soviet land and people were in 1946 more hermetically sealed off from contact with the outside world than at any other previous time in Russian history. Little was known abroad about conditions; no free flow of information was allowed to reach the Russian people from the outside and especially from the democratic world.

The disagreement about freedom was fundamental. The Russians maintained that true freedom, including freedom of the press, existed only in the soviet union. When the 10,000th issue of the official Bolshevik party newspaper, *Pravda*, appeared on Sept. 24, 1945, an occasion on which

the paper received from the government the Order of Lenin, its editor, David Zaslavsky, declared that freedom of press in the western countries was only an illusion, and that the soviet union, with journalists who did not sell themselves and were not bound to obedience by capitalist publishers, alone enjoyed such freedom.

When in the absence of Marshal Stalin, who was resting in the Caucasus, Molotov delivered in Nov. 1945 the great annual address in celebration of the anniversary of the bolshevik revolution of Nov. 1917, he stressed the point that only the soviet union represented true democracy. He spoke of "a flourishing of true democracy of the people (in the U.S.S.R.) that they did not know in the old days and that cannot exist in any other states, divided as they are into classes of oppressors and oppressed, a thing that soviet power has long put an end to in our country. . . . Unlike parliamentary democracy, the democracy of the soviets is a true democracy of the people."

Though Molotov in his speech mentioned the patriotic character of World War II, he stressed emphatically that it was the soviet government and the bolshevik revolution which had given Russia and the Russian people the strength for their great victories. "The soviet people called its war... the great patriotic war. By the example of the soviet people, patriots of other states learned how one must fight for one's motherland, for its liberty and independence." This Russian strength was, in Molotov's opinion, due to "the leadership of the party of Lenin and Stalin," above all to "the great Stalin, the farseeing and tried leader of the soviet union."

Accordingly the efforts of communist indoctrination and of teaching the pure doctrine of Marx and Lenin in the official interpretation were intensified. The strict unity and regimentation of the soviet state rested on the monolithic unity and discipline of the Communist party, of which Marshal Stalin was general secretary. With the end of the war the emphasis shifted again to party doctrine and party leadership.

At the beginning of 1946 the soviet people were prepared for the forthcoming elections to the supreme soviet, held on Feb. 10. Marshal Stalin and the other speakers in their election addresses stressed the need to devote the next 15 or 20 years to develop above all the military power of the soviet union. Lazar Kaganovich, one of Marshal Stalin's foremost collaborators, declared that "we must always remember, our country continues within a capitalist encirclement. We should not relax but strengthen bolshevist vigi-

Convoy of Russian trucks making the dangerous night trek to besieged Leningrad across the frozen surface of Lake Ladoga during the winter of 1941–42

lance." Due praise was given to the Communist party and its great leader for having saved Russia by transforming the country into a highly industrialized arsenal and having led the people to victory. President Kalinin pointed out the superiority of soviet elections over democratic elections, which "are not calculated to arouse and develop the political mind of the masses but to deaden and blind them and crush the slightest sign of independent political thought." In the elections in the U.S.S.R. 99.7% of the people qualified to vote actually did vote according to official figures, and 99.18% of them voted for the party in power.

On Feb. 25, 1946, the people's commissariat for defense was transformed into a people's commissariat of the armed forces, under which the land army, the air forces and the navy were united. Generalissimo Stalin was named people's commissar of the armed forces and supreme commander in chief of the armed forces of the U.S.S.R. On March 15 the term minister was substituted for the term of people's commissar, which was introduced by the Russian revolution of Nov. 1917. On the same day the supreme soviet was told that Russia's new five-year plan called for increasing the nation's production to one and one-half times the prewar level by 1950 and for providing the Red army with the most modern armaments. The head of the state planning department declared that "monopolistic capitalism can produce a new aggressor," while by taking advantage of the superiority of the soviet discipline, the U.S.S.R. could outstrip the capitalist countries in all types of progress, including technology. On March 19 Generalissimo Stalin was re-elected prime minister, while the resignation of the critically ill President Kalinin was accepted, and Nikolai Mikhailovich Shvernik was elected as his successor. All elections were unanimous.

In May 1946, a new 20,000,000,000 rouble internal loan (nominally \$3,774,000,000) was oversubscribed on the first day. The bonds were non-interest bearing but entitled holders to participation in the semiannual lottery prize drawings. *Izvestia* saw in the success of the loan proof of Russian determination to maintain its military power. (See also COMMUNISM.)

Unitarian Church

In 1937, Unitarianism was still in the stage of parochial development; by 1946, it had taken its place as a numeri-

cally small but potentially significant factor in the field of religion on a world-wide scale. In many ways, Unitarianism came of age during this turbulent decade, especially as an organized force. The most striking evidence of this was in the work of the Unitarian Service committee, which was organized in Boston, Mass., in 1940, and which in 1946 was carrying on humanitarian service in 12 countries, with a budget that had increased more than tenfold. The non-sectarian, nonpolitical program which the Unitarian Service committee conducted made the word Unitarian known to a vast number of people in all parts of the world who, prior to 1940, had never even heard of it.

In 1937, when the triennial Congress of the International Association for Liberal Christianity and Religious Freedom was held in Oxford, England, it was clear to all the delegates that the storm clouds were gathering over Europe so threateningly that the plans for the next congress, scheduled to be held in Budapest in 1940, would have to be made subject to the course of events. No congress was held in 1940, nor in 1943, nor in 1946. But in the latter year a smaller planning conference was held in Cambridge, England, with 35 delegates from the U.S., Great Britain, Holland, Czechoslovakia, Denmark, Switzerland, Belgium, Sweden and India. It was decided that the earliest date at which a congress could be held was 1948, and plans were laid to hold it in that year in Prague. Dr. John Howland Lathrop, the head of the U.S. delegation, was elected president and the secretariat was continued in Holland.

The tremendous sufferings endured after the outbreak of the war by Unitarians and other religious liberals, not only in occupied countries but by all, were obvious. Certain countries, such as Hungary and the Philippine Islands, which were unable to send representatives, had perhaps suffered most of all. But from all reports it became clear that the spirit of free religion had not been crushed; indeed it was apparent to all that the effect of the war in many lands had been to deepen the determination of the liberals to strengthen and extend their influence. The line between the religions of authority and the free faith were drawn more sharply, and the opportunity facing the liberal forces was far greater and more challenging than ever.

In Britain, a flying bomb destroyed Essex hall, general headquarters of the church, on July 28, 1944. Six churches were completely destroyed and many others damaged. With varying details this general story applied throughout, and there were, of course, many losses other than in the material fabric of the churches. The ranks of the ministry were depleted—30 fewer in 1946 than in 1939. But the spirit of the British Unitarians was shown in the appointment in 1943 of a Commission on the Work of the Churches, which brought in a thorough and heartening report, and in the effort to raise a special fund of £100,000 to strengthen the churches.

The development of organized Unitarianism in the U.S. and Canada during this period was much less affected by the war and could be summarized in the phrase "Unitarian Advance," which first came into general use in 1937 and received great additional impetus as the result of the reports of three special committees in 1944. An excellent picture of the general forward movement, not only in the U.S. but throughout the world, was in a volume published in 1946 by the Beacon press, Boston, Mass., entitled Together We Advance, edited by Stephen H. Fritchman.

Organizationally, the ten-year period saw the carrying out of many of the recommendations of the Commission of Appraisal which reported to the American Unitarian association in 1936. Special emphasis was given to the

newly organized Division of Publications, to the Unitarian Service committee, to a sound policy of establishing new churches, recruiting the additional ministers needed for the advance program and the rapid development of new curriculum material in the field of religious education.

Among the specific accomplishments of the decade 1937–46, mention should be made of the organization of the United Unitarian Appeal—a co-operative enterprise to raise the operating funds for the several Unitarian agencies, on the basis of a community chest—which had now become an accepted part of the denominational machinery. The total raised in 1945 was \$235,000 and the amount for 1946 was \$376,000. In 1946 the Appeal was incorporated.

The denominational journal, The Christian Register, in its 125th year at the end of the decade, had doubled its circulation since 1937. The Unitarian Service committee, organized in 1940 as a standing committee of the American Unitarian association, showed remarkable growth. During the year ending April 30, 1946, funds were entrusted to it for humanitarian service and relief totalling nearly \$1,000,000. The staff, at home and abroad, numbered over 200 in 1946.

During 1946 the Service committee expanded its work with the following functions and in the following countries; a service centre in Holland for food and clothing distribution, a children's home and a medical teaching team in Czechoslovakia, a dental clinic for displaced people in Innsbruck, Austria, established at the request of the Austrian government, and a service centre for clothing and food distribution in the city of Vienna. In Germany, the committee established a program in co-operation with U.N.R.R.A. for the displaced people in the refugee assembly centres of the occupied zones. A medical team and a child welfare group were operating under this program. In Budapest, there was a service centre for the distribution of clothing and food, and in Poland a medical teaching mission. All this was in addition to the maintenance and expansion of the work for refugees in the countries where the committee had operated for several years.

Branches of the Service committee were established in Czechoslovakia, Holland, England and Canada. Special mention should be made of the work of the Canadian Unitarians through their Service committee, carried on over and above their share in the United Appeal. The executive director of the Unitarian Service committee in Canada was successful in mobilizing a broad public support through the dominion for the program of the Unitarian Service committee.

By the summer of 1946, 213,640 lb. of canned food had been received in the warehouse in New York and shipped abroad. In addition, \$46,993 had been received as unsolicited contributions for the purchase of canned food; 31 shipments, totalling 285 tons, had been made. The food was allocated as soon as it was received to relief and food distribution offices overseas. During a 15 months' period, 623,032 lb. of used clothing were received, processed, baled and shipped; 297 Unitarian churches took part in this clothing collection campaign. (F. M. E.)

United Church of Canada

The account of the life and growth of the United Church of Canada during the years 1937–46 can best be presented by considering the work of the church in several spheres of endeavour. In 1937 there were approximately 457.373 families, 698,738 members and 1,729,248 persons under pastoral oversight. During the following ten years these figures steadily increased so that in mid-1946 there were 43,179 more families than in 1937. There were 231,-

919 persons received into church membership on profession of faith, bringing the total to 505,686, with the year 1944 showing the largest increase. Moreover, the dominion census figures of 1941 revealed that 2,204,875 persons, comprising about one-fifth of the Canadian population (40% Roman Catholic in 1946) claimed some connection with the United Church. Furthermore, the 1941 census disclosed that in the province of Manitoba a larger number of people of non-Anglo-Saxon origin were identifying themselves with the United Church than with any other denomination.

At the outbreak of World War II in 1939, the church rallied to the support of the government and sought to provide spiritual ministrations and material aid for those serving in the three branches of the armed forces. There were 233 ministers commissioned as chaplains. Of this number, 3 paid the supreme sacrifice, 14 received military decorations and 8 were mentioned in military dispatches. More than 1,000 war service units were organized throughout the congregations which sent forth 6,000,000 articles for the material aid of the Canadian forces, as well as for the comfort of refugees and the victims of bombing raids. More than \$50,000 was raised as an aid to British churches, and at the end of the decade more than \$150,000 had been contributed for the restoration of Protestant churches in Europe.

During the depression years, which included the period of the drought on the prairies of Saskatchewan, the United Church accumulated a deficit of \$1,700,000. In 1940 it was suggested that an effort be made to clean up this indebtedness by encouraging members and adherents to purchase government war savings certificates and to donate them to the church. The amounts paid and pledged would be invested to mature in 1950. The plan was launched in 1941 and continued until 1944. At the close of that period the whole of the deficit had been underwritten.

The pension fund of the church began to show signs of financial weakness soon after union. The annual revenue to be received from the missionary and maintenance fund fell short of expectations; interest rates on investments declined sharply as a result of the depression; legacies also decreased. Since each minister was assessed for pensions on a percentage basis of his salary, and since salaries generally were lowered during the depression years, revenue from this source declined. To meet liabilities, encroachments were made on capital reserves. These began in 1935 and continued until 1945. The total withdrawals from capital amounted to \$800,000. Early in 1946 a campaign capital committee, composed exclusively of laymen, was set up to launch a drive to secure \$3,500,000 new capital. The campaign was launched in April, and \$4,000,000 was soon subscribed.

The first official paper of the United Church of Canada, following the union of 1925, was known as The New Outlook. In spite of the fact that it was a well edited paper, subscriptions declined. In addition, The United Church Record and Missionary Review represented the continuance of preunion missionary publications. In 1939 it was decided to merge these periodicals into The United Church Observer to be issued semimonthly and to feature the news of the church at home and abroad in attractive fashion with a liberal use of pictures. This modern trend in journalism proved popular. During the period 1941–46, the circulation of the new paper increased from 15,000 to more than 50,000.

The years of 1937-46 indicated that the United Church

had not been recruiting a sufficient number of ministers to undertake adequately the task which was visualized when the Congregationalists, Methodists and Presbyterians came together to form the new church. This shortage of ministers manifested itself throughout the 11 conference areas, but was particularly critical in the 3 prairie provinces, a section which, because of pioneer conditions, could least afford such decrease. This situation was partially met by the employment of laymen and deaconesses, but in spite of this effort congregations in western Canada were left without pastoral oversight. With the end of the war and the return of chaplains, the situation eased somewhat. It was clear, however, that in this matter of an adequate supply of candidates for the ministry, the church was facing a spiritual problem.

* * *

The Period of utopianism in religious outlook which characterized the churches during the years immediately following World War I, had given way to a temper more radical and discerning. This manifested itself in the field of religious education by a strong trend toward the biblical and the doctrinal. By the year 1940 there was a marked yearning throughout the United Church for a deeper faith. To meet this need four educational documents were produced: a short Statement of Faith and an exposition of the same by Prof. John Dow under the title This Is Our Faith. Early in 1944 a Catechism was published by a commission at work in that field. In the first year and a half after publication, 140,000 copies of the Catechism were sold

The 1941 Canadian census revealed that approximately 600,000 people in Canada claiming to be attached to the United Church were lapsed from any visible connection with it. To meet this challenge a vigorous campaign of visitation evangelism was undertaken. Encouraging results were reported throughout the length and breadth of the church. The years 1944–46 showed a marked increase in the number of persons received into membership on profession of faith.

In 1944 the United Church responded to an appeal sent forth by the General synod of the Church of England in Canada to all other churches to discuss, through chosen representatives, the possibilities of closer unity. These conversations resulted in a report covering the procedure whereby the ministries of the two churches could be conferred each upon the other. (G. A. SI.)

United Kingdom

See Great Britain and Northern Ireland, United Kingdom of.

United Nations

The term "United Nations" was coined by Pres. Franklin D. Roosevelt to describe the allied nations fighting the axis powers. It was first formally used in the Declaration by United Nations of Jan. 1, 1942, when the representatives of 26 countries pledged their governments to employ their full resources for the prosecution of World War II, to co-operate with one another and not to make a separate peace. Other governments subsequently adhered to the declaration.

It was not, however, until Oct. 30, 1943, that the need for establishing an international organization to maintain peace and security after the cessation of hostilities was formally recognized in an international declaration. On that date the foreign ministers of the soviet union, the United Kingdom and the United States and the Chinese ambassador to the soviet union issued, on behalf of their governments, the "Declaration of Four Nations of General Security" (commonly known as the Moscow declaration). They declared that their united action pledged for the prosecution of World War II would be continued for the organization and maintenance of peace and security

In the period which followed, various unofficial schemes for a world organization were prepared and circulated for information and study.

Dumbarton Oaks.—Concrete steps to formulate an agreed plan were taken by the four signatories of the Moscow declaration in the late summer of 1944. Conversations regarding a possible world organization were held at Dumbarton Oaks from Aug. 21 to Oct. 7. The first phase of the conversations, from Aug. 21 to Sept. 28, was between officials representing the soviet union, the United Kingdom and the United States; the second phase, from Sept. 28 to Oct. 7, between officials representing China, the United Kingdom and the United States. The reason for holding the conversations in two parts was that the soviet union was not at that time at war with Japan.

As a result of these conversations, the four powers reached agreement on a detailed plan for the proposed international organization. This plan was made public on Oct. 10, 1944, in the form of "Proposals for the Establishment of a General International Organization," commonly known as the Dumbarton Oaks proposals.

These proposals set forth the purposes and principles of the international organization, and stated that its membership should be open to all peace-loving states. They provided that the organization should have as its principal organs: a general assembly, a security council, an international court of justice and a secretariat, as well as such subsidiary organs as were found necessary.

The composition, functions, powers and procedure of the general assembly and the Security council were outlined, as was also the voting procedure for the general assembly. Agreement was not, however, reached at Dumbarton Oaks on voting procedure for the Security council.

The general assembly was to be composed of all the members of the United Nations, each of which was to have one vote. Among the functions assigned to the assembly were: to consider the general principles of co-operation in the maintenance of international peace and security; to discuss questions relating to the maintenance of peace and security brought before it by members or by the Security council and to make recommendations on them (except on a matter being dealt with by the Security council); to admit, suspend or expel members on the recommendation of the Security council; to elect the members of the Economic and Social council and the non-permanent members of the Security council, and, on recommendation of the Security council, the secretary-general; to apportion among members the expenses of the organization; and to make recommendations to promote international co-operation in political, economic and social fields.

Decisions on important questions were to be made by a two-thirds majority, on other questions by a simple majority.

The Security council was to be composed of 11 members. Five—the representatives of the United States, the United Kingdom, the U.S.S.R., China and "in due course" France—were to have permanent seats. The remaining six would be elected for two-year terms by the general assembly. On the Security council was to be conferred "primary responsibility for the maintenance of international peace and

It was proposed that the international court of justice should be the principal judicial organ of the organization, and that its statute should be either that of the Permanent Court of International Justice, or a new statute, based on that of the permanent court. All members of the organization should *ipso facto* be parties to the court's statute.

The secretariat was to be composed of a secretary-general and such staff as might be required. The secretary-general, who was to be the chief administrative officer of the organization, was to be elected by the general assembly on recommendation of the Security council. It was proposed that he should have the right to bring to the attention of the Security council "any matter which in his opinion may threaten international peace and security."

One of the most important chapters of the Dumbarton Oaks proposals related to "Arrangements for the Maintenance of International Peace and Security, including Prevention and Suppression of Aggression." This chapter included three sections, the first dealing with the pacific settlement of disputes, the second with the determination of threats to the peace or acts of aggression and the action to be taken regarding them and the third with regional arrangements. The chapter provided for the steps which might be taken to maintain or restore international peace and security by the Security council in fulfilment of the primary responsibility conferred on it by the members of the organization.

They included in the last resort action by land, air or sea forces. Members were to undertake to make available to the Security council in accordance with special agreements the necessary armed forces, facilities and assistance. A military staff committee composed of the chiefs of staff of the permanent members of the Security council was to advise the council.

A further chapter, dealing with "Arrangements for International Economic and Social Co-operation," provided for an Economic and Social council to act under the authority of the general assembly. It was also provided that various specialized economic, social and other organizations should be brought into relationship with the organization.

Other chapters provided for the coming into force of amendments when adopted by two-thirds of the members of the organization and ratified by the permanent members of the Security council and a majority of other members, and for joint action to be taken to maintain peace and security by the four signatories of the Moscow declaration pending the conclusion of agreements making armed forces available to the Security council.

Crimea Conference.—Agreement on the question of voting in the Security council was reached at the Crimea conference between Prime Minister Churchill, President Roosevelt and Marshal Stalin in Feb. 1945. At the same time, the report issued at the conclusion of the conference stated that it had been agreed to call a conference of United Nations to meet at San Francisco on April 25, 1945, to prepare a charter for a world organization along the lines proposed at Dumbarton Oaks.

China and France would be consulted and invited to join the British, soviet and United States governments in sponsoring the invitations to the San Francisco conference.

The consultations took place, and the Chinese government agreed to join in sponsoring the invitations. The French government, which had not taken part in the Dumbarton Oaks conversations, agreed to attend the conference but decided not to act as a sponsoring power.

The countries qualifying for invitations to the San Francisco conference were those which had adhered to the dec-

laration by United Nations of Jan. 1, 1942, and had declared war on Germany or Japan by March 1, 1945.

The invitations were issued on March 5, 1945, and contained the voting proposals for the Security council. It was proposed that each member of the Security council should have one vote, that decisions on procedural matters should be made by an affirmative vote of seven members, and that decisions on all other matters should be made by an affirmative vote of seven members including the concurring votes of the permanent members. In decisions concerning peaceful settlement or settlement through regional agencies or arrangements, however, a party to a dispute was to abstain from voting.

Poland's name was included among the countries listed as having qualified for invitations, but at the same time it was stated that the invitation to it was being held over until the projected Polish Provisional Government of National Unity was constituted.

Suggestions for Supplementing Dumbarton Oaks Proposals.—Throughout the world the Dumbarton Oaks proposals were discussed, criticized, commended and attacked in press and pamphlet and on the radio, and suggestions for their emendation were being worked out by governments, both severally and individually.

The Dumbarton Oaks proposals had left open the question of whether the statute of the international court of justice should be that of the permanent court or a new statute based upon it. Accordingly the United States government, acting on behalf of the governments sponsoring the San Francisco conference, invited a committee of expert jurists to meet in Washington on April 8 for preliminary discussions. Jurists from 44 countries attended, and proceeded to a revision, article by article, of the statute of the permanent court, making adaptations of form and introducing new features considered desirable. The question of whether the court should be established as a new court or as a continuance of the permanent court was left to the San Francisco conference to decide.

The question of trusteeship was placed tentatively on the agenda of the Dumbarton Oaks conversations, but the Dumbarton Oaks proposals contained no trusteeship provisions. At Yalta it was agreed that the five governments having permanent seats on the Security council should consult each other prior to the United Nations conference on providing machinery for territorial trusteeships. This would apply only to: existing mandates of the League of Nations; territory to be detached from the axis as a result of World War II and any other territory which might voluntarily be placed under trusteeship. They agreed further that there would be no discussions concerning any specific territory, but only on the machinery and principles of trusteeship. It would be a matter of subsequent agreement which territories would actually be placed under trusteeship.

In the second phase of the Dumbarton Oaks conversations, the Chinese government had put forward certain proposals which were agreed to at that time between China, the United Kingdom and the United States. The soviet union agreed to join in sponsoring the proposals, and they were submitted to the San Francisco conference on May 1 as a supplement to the Dumbarton Oaks proposals.

In addition the conference had before it amendments submitted by 40 national delegations and including an estimated total of some 1,200 items. The sponsoring powers themselves submitted 24 joint amendments.

399

The San Francisco Conference.—In addition to the 4 sponsoring powers, 42 nations were invited to the United Nations Conference on International Organization at San Francisco. On April 30 the conference approved the admission of Argentina, the Byelorussian Soviet Socialist Republic and the Ukrainian Soviet Socialist Republic. Denmark, which had just been liberated, was invited to attend the conference on June 5. Fifty nations, therefore, were represented at the San Francisco conference and took part in drawing up the United Nations charter (see p. 403 for list of members).

The organization of the conference was in the hands of four committees. First there was a steering committee, composed of the heads of all the national delegations, which considered major questions of policy and procedure. It elected an executive committee composed of the chairmen of 14 delegations which took interim decisions and prepared recommendations for consideration by the steering committee. The members of the executive committee were: Australia, Brazil, Canada, Chile, China, Czechoslovakia, France, Iran, Mexico, the Netherlands, U.S.S.R., United Kingdom, United States and Yugoslavia. A co-ordination committee consisting of the deputies of the 14 members of the executive committee supervised the final drafting of recommendations made by the commissions of the conference and harmonized divergent drafts. In addition there was a credentials committee which verified the credentials of delegations.

The substantive work of the conference was divided among 4 commissions, and the work of these 4 commissions was in turn divided among 12 technical committees. Each nation had the right to be represented on each commission and each committee.

Commission I dealt with the general provisions of the world organization. It had two committees which dealt with (1) preamble, purposes and principles and (2) membership and general.

Commission II was concerned with the general assembly. It had four committees, which dealt with (1) structure and procedures, (2) political and security functions, (3) economic and social co-operation and (4) trusteeship system.

Commission III considered the Security council. It had four committees, which dealt with (1) structure and procedures, (2) peaceful settlement, (3) enforcement arrangements and (4) regional arrangements.

Commission IV dealt with judicial organization. It had two committees which dealt with (1) international court of justice and (2) legal problems.

To each committee were assigned as a basis for discussion the relevant sections of the Dumbarton Oaks proposals. The terms of reference of the committee on the trusteeship system, for which no provision was made in the Dumbarton Oaks proposals, were to prepare "draft provisions on principles and mechanism of a system of international trusteeship for such dependent territories as may by subsequent agreement be placed thereunder." The committee on legal problems had to consider proposals and documents presented by participating governments on various legal problems not touched upon in the Dumbarton Oaks proposals. The committee on the international court of justice had before it in addition to the relevant chapter in the Dumbarton Oaks proposals the draft statute prepared by the committee of jurists.

English and French were adopted as the working languages of the conference; the official languages were Chinese, English, French, Russian and Spanish. The secretary-general of the conference was Alger Hiss of the United States department of state. The United States as host government met the general expenses of the conference which were estimated at somewhat less than \$2,000,000, and was responsible for the recruitment of the secretariat.

The charter emerged from the San Francisco debates a broader, more liberal document than the Dumbarton Oaks proposals. Among the many changes made at San Francisco to the Dumbarton Oaks draft, the following may be noted:

A preamble was added to the charter, setting forth the declared common intentions of its drafters. The chapter on purposes was liberalized. Thus, the adjustment of international disputes by peaceful means was to be brought about "in conformity with the principles of justice and international law." Friendly relations "based on respect for the principle of equal rights and self-determination of peoples" were to be developed. The purpose of achieving international co-operation "in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language or religion" was added.

Similarly, changes were made in the chapter on principles. Members undertook to fulfil "in good faith" the obligations assumed by them under the charter. They agreed to settle their disputes by peaceful means in such a manner that not only international peace and security, but also "justice" were not endangered. The principle that members should refrain from the threat or use of force was expanded to read "refrain from the threat or use of force against the territorial integrity or political independence of any state." Nonintervention in matters within the domestic jurisdiction of any state became one of the principles; in the Dumbarton Oaks proposals this question had been dealt with in the chapter on peaceful settlement.

As regards membership, the conference drew a distinction between "original" members and new members. Original members were to be those states which participated in the conference or had previously signed the United Nations declaration and signed and ratified the charter. New members were not only required to be "peace-loving" as specified in the Dumbarton Oaks proposals; they had also to accept the obligations contained in the charter and in the opinion of the organization to be able and willing to carry them out.

The powers of the general assembly were amplified. Thus, the assembly was empowered to "discuss any questions or any matters within the scope of the present charter or relating to the powers and functions of any organs provided for in the present charter." With the exception of matters under consideration by the Security council (an exception contained in the Dumbarton Oaks proposals) the assembly was also empowered to make recommendations on any such matters to the Security council or to members or to both. Subject to this same reservation it was also empowered to make recommendations "for the peaceful adjustment" of any situation it thought likely to impair the general welfare or friendly relations among nations, including situations resulting from violation of the charter.

As regards the Security council, the Dumbarton Oaks proposals were in the main adopted. It was, however, decided that France should from the outset be a permanent member of the council instead of "in due course," as proposed at Dumbarton Oaks. A clause was added providing that in the election of the non-permanent members of the council due regard should be "specially paid, in the first instance, to the contribution of members of the United

Nations to the maintenance of international peace and security and to the other purposes of the organization, and also to equitable geographical distribution."

The voting procedure in the Security council was one of the most controversial issues at San Francisco, several delegations opposing in particular the rule that the permanent members of the council must be unanimous in recommending measures for peaceful settlement. In an effort to clarify the voting formula agreed upon at the Crimea (Yalta) conference, the sponsoring powers and France issued an interpretation in reply to a list of 22 questions drawn up in the sub-committee considering the question. This interpretation, which was taken as embodying the views of these 5 governments, upheld the provision for unanimity of the permanent members except that a party to a dispute would not vote on a recommendation involving peaceful settlement, and no member of the council could prevent consideration and discussion by the council of any dispute brought to its attention by a mem-

Although several delegations were opposed to it on principle, the Yalta formula was eventually adopted, as the sponsoring powers made it clear that they could not accept any of the amendments proposed.

A new paragraph was added to the chapter on enforcement measures, providing that the Security council before deciding on such measures might call on the parties to a dispute to comply with provisional measures. The article relating to the provision of national contingents of armed forces was re-drafted to make it more specific. A paragraph was also inserted providing that the Security council before calling on a member to provide armed forces should invite that member to take part in the discussions concerning the employment of these forces. Another new paragraph safeguarded "the inherent right of individual or collective self-defence" in case of armed attack until the Security council had taken the necessary measures, but any measures taken in self-defense were to be reported to the council.

The Dumbarton Oaks proposals had suggested that no enforcement action should be taken under regional arrangements or by regional agencies without the approval of the Security council. One exception was approved at San Francisco—action taken under regional arrangements directed against the renewal of aggressive policy by any enemy-state, until the Security council should be charged by the governments concerned with the responsibility for such action.

The economic and social provisions of the charter were given a greater importance at San Francisco. Thus, the Economic and Social council was made one of the principal organs, and the objectives of the United Nations in the economic and social field were enlarged.

The functions of the Economic and Social council were also extended. It was to initiate studies and make recommendations with respect to international economic, social, cultural, educational, health and related fields. It was decided, however, that the general assembly and not the Economic and Social council should examine the administrative budgets of specialized agencies. The specialized agencies to be brought into relationship with the United Nations were described more precisely as inter-governmental agencies having wide international responsibilities, as defined in their basic instruments, in economic, social, cultural, educational, health and related fields.

The charter provisions on international trusteeship and the declaration on non-self-governing territories were the product of the San Francisco conference. On the basis of a

number of proposals the delegations of Australia, China, France, the U.S.S.R., the United Kingdom and the United States submitted a working paper which served as a basis for discussion in the committee on trusteeship. Changes, however, were made to the working paper. Thus, a statement of general policy, contained in the paper, was separated from the provisions for a trusteeship system and became a separate chapter of the charter under the title "Declaration regarding Non-Self-Governing Territories," binding on all powers administering non-self-governing territories. These territories were defined as those "whose peoples have not yet attained a full measure of self-government." The clauses defining the obligations of powers administering such territories toward the inhabitants were considerably expanded, and two new clauses were added, obliging the administering powers to promote constructive measures of development and to transmit regularly to the secretary-general statistical and other information relating to the economic, social and educational conditions of the territories administered by them.

After some controversy it was decided that the objectives of the trusteeship system should include the promotion of the progressive development of the peoples of trust territories toward "independence" as well as "self-government." It was decided that the Trusteeship council should be a principal organ of the United Nations.

The conference, after considering the recommendation

Interpreters providing simultaneous translations of United Nations proceedings at Lake Success, N.Y., in 1946. Delegates were provided with headphones; dials enabled them to tune in on translations in the language which they preferred

of the committee of jurists and the draft statute prepared by them, decided that the advantages of establishing a new court of justice outweighed those of retaining the permanent court. A provision was added to the charter that each member should undertake to comply with the decision of the court in any case to which it was a party, and that if any party should fail to comply with a decision the other party could have recourse to the Security council.

To the Dumbarton Oaks provisions concerning the secretariat the conference added clauses providing that the secretary-general and his staff should not seek or receive instructions from any authority external to the organization, and should refrain from any action reflecting on their position as international officials; that members should undertake to respect the exclusively international character of the secretariat; and that the paramount consideration in the employment of staff should be the necessity of securing the highest standards of efficiency, competence and integrity, due regard being paid to recruitment on as wide a geographical basis as possible.

On the question of amendments, certain delegations opposing the voting formula in the Security council felt that they could more readily accept the charter if the process of amendment were made easier. To meet their wishes, provision was made for the calling of a general conference to review the charter. The conference would be called by a two-thirds vote of the general assembly and any seven members of the Security council, and it was agreed that if such a conference had not been called before the tenth annual session of the general assembly, the question of calling it should be placed on the agenda of that session.

Other provisions of the charter drafted at San Francisco concerned the registration of treaties, obligations inconsistent with the charter, the privileges and immunities of the United Nations, its legal status and the signature and ratification of the charter.

The charter was signed on June 26, 1945, by the representatives of the 50 nations participating in the conference. A space was left among the original signatories for Poland, which signed on Oct. 15, 1945.

The terms of the charter provided that it should come into force when the five permanent members of the Security council and a majority of other signatory states had ratified it and deposited their ratifications with the U.S. department of state. This took place by Oct. 24, 1945, and the United States secretary of state on that date signed the Protocol of Deposit of Ratifications, bringing the charter into force.

At the same time as they signed the charter, delegates to the San Francisco conference affixed their signatures to an agreement on interim arrangements. This agreement established a preparatory commission, consisting of one representative of each signatory of the charter, to prepare for the first sessions of the general assembly, Security council, Economic and Social council and trusteeship council, for the establishment of the secretariat and for the convening of the international court of justice. The commission was to have an executive committee composed of the representatives of the 14 members of the executive committee of the conference.

The Preparatory Commission.—The preparatory commission ("Preco") met in San Francisco on June 27, 1945, and made arrangements for its executive committee to meet in London.

The executive committee convened in London on Aug. 16, 1945. It reported to the preparatory commission, which

met in London from Nov. 24 to Dec. 23 and, on the basis of the executive committee's report, drew up recommendations for the general assembly. These recommendations were embodied in the "Report of the Preparatory Commission of the United Nations."

The commission and its executive committee were assisted by an executive secretary, appointed by the executive committee, and an international secretariat appointed by him.

The preparatory commission recommended that the general assembly should meet as early as possible, and it submitted the provisional agenda for the first session and provisional rules of procedure. It recommended that the assembly establish six main committees (political and security; economic and financial; social, humanitarian and cultural; trusteeship; administrative and budgetary; legal), two procedural committees (credentials committee and general committee), two standing committees (advisory committee on administrative and budgetary questions and committee on contributions) and such ad hoc committees as might be required.

The commission also recommended a provisional agenda and provisional rules of procedure for the Security council. It suggested that the representative of the first member of the Security council in the English alphabetical order of the names of members should act as temporary chairman of the council. At its first meeting the council should adopt a directive requesting the chiefs of staff of the permanent members of the Security council to meet at a given place and to constitute the military staff committee. The recommendations concerning the Security council were less detailed than those concerning the other organs of the United Nations, partly because it was felt that the council would meet continuously and would be able to develop its own organization and program of work.

The preparatory commission submitted a provisional agenda and rules of procedure for the Economic and Social council. It recommended that at its first session the council establish the following commissions: human rights, economic and employment, temporary social, statistical, and narcotic drugs, and that it consider the desirability of establishing a co-ordination commission and a fiscal commission. While not accepting a proposal that there should be a commission on refugees, the preparatory commission recommended that the problem should be studied by the Economic and Social council and also by the general assembly in view of the political questions involved.

The commission submitted provisional rules of procedure for the Trusteeship council and a draft resolution for adoption by the general assembly, calling on mandatory powers to take practical steps, together with the states directly concerned, so that trusteeship agreements could be submitted for approval preferably not later than the second part of the assembly's first session.

The preparatory commission had been authorized to issue invitations for the nomination of candidates for the international court of justice. The statute of the court required that three months should elapse from the date of the issue of invitations for nomination until the election of judges. Accordingly, the invitations were issued on the instructions of the executive committee. This action was endorsed by the preparatory commission, which recommended that the general assembly take the necessary steps for convening the court. It also adopted a resolution stating that it would welcome the taking by the League of Nations of appropriate steps to dissolve the Permanent Court of International Justice.

The commission recommended that the secretary-general

should work out the details for registration and publication of treaties, to be registered in accordance with the terms of the charter. It also recommended that the general assembly consider inviting non-members to send treaties and international agreements for registration with and publication by the secretariat, and inviting all governments to send for publication treaties and international agreements concluded before the date of entry into force of the charter and not included in the League of Nations Treaty series.

The commission transmitted to the general assembly for its consideration a study on privileges and immunities presented by the executive committee and a draft convention on privileges and immunities. It also recommended that the privileges and immunities of specialized agencies should be reconsidered and that the agencies should be granted only those privileges necessary to the fulfilment of their functions.

The commission recommended that the secretariat should be organized on a functional basis, and that its principal units should be: department of security council affairs, department of economic affairs, department of social affairs, department of trusteeship and information from non-self-governing territories, department of public information, legal department, conference and general services, administrative and financial services. The secretary-general, it was recommended, should take the necessary steps to co-ordinate the work of the departments of economic and social affairs.

The commission appointed a technical advisory committee on information to make recommendations concerning the functions, policies and activities of the department of public information. The committee's recommendations were transmitted to the general assembly for its consideration.

The preparatory commission considered that the secretary-general's freedom to organize the secretariat should not be restricted by too much detail. The question of salaries, allowances and pensions was referred for preliminary study to an advisory group of experts appointed by the preparatory commission to assist the executive secretary in the development of administrative, budgetary and personnel policies. The preparatory commission submitted provisional staff regulations, which it suggested for adoption by the assembly and provisional staff rules to implement these regulations which it suggested the assembly should transmit to the secretary-general for his information. The commission recommended that the secretarygeneral establish an international civil service commission, after consultation with the heads of specialized agencies, to advise him on methods of recruitment for the secretariat.

One of the functions specifically assigned to the commission was to make studies and prepare recommendations on the location of the permanent headquarters of the organization. After considerable debate both in the executive committee and in the preparatory commission it was decided to recommend that the permanent headquarters should be located in the east of the United States. Since it was felt that more time was required to determine an exact site, an interim committee of 12 members was appointed to function after the close of the preparatory commission's session. It was to determine the exact requirements for the site and to examine specific sites in the light of these requirements. On Dec. 25, 1945, the interim committee approved three possible areas (near Boston, Princeton and New York, respectively) for the site and appointed an inspection group of seven members. The inspection group, after studying the areas, recommended that the permanent headquarters should be established (1) near New York city and (2) in the North Stamford-Greenwich district.

Another task assigned to the preparatory commission was to make recommendations concerning the transfer of functions, activities and assets of the League of Nations which it was considered the new organization should take over. The commission recommended that the United Nations should assume only custodial, technical and nonpolitical functions performed by the League under international agreements and that the general assembly reserve the right, after due examination, not to assume any particular function or power. It recommended that the Economic and Social council survey the non-political functions of the league, other than those arising from international agreements, to determine which should be assumed by the organization or by the specialized agencies. Pending the conclusion of this survey, the council should provisionally continue certain of these functions.

On Dec. 18, 1945, the commission appointed a committee of eight members to enter into discussions with the League of Nations supervisory committee for the purpose of establishing a common plan for the transfer of the assets of the League of Nations to the United Nations. The common plan was to be submitted to the general assembly at the first part of its first session.

Thus, by the time the general assembly met in London on Jan. 10, 1946, for the first part of its first session, the preliminary work had been accomplished and the way prepared for the establishment of the United Nations as a working organization.

The First Year

The first year of the United Nations was of necessity largely concerned with the establishment of its principal and subsidiary organs, and with organizational questions; nevertheless many substantive questions in the political, economic and social fields were actively considered.

The charter came into force on Oct. 24, 1945, and the preparatory commission completed its work on Dec. 23, 1945, so arrangements were made for convening the first session of the general assembly. This session was divided into two parts; the first part was held in London from Jan. 10 to Feb. 14, 1946, and the second part from Oct. 23 to Dec. 15, 1946. It was planned that the first part of the session should deal largely with organizational problems, and the second with substantive questions, but decisions on certain substantive questions were in fact taken at the first part of the session.

The necessary steps were also taken to bring the other organs of the United Nations into being. Thus the non-permanent members of the Security council were elected by the assembly on Jan. 12. The council held its first meeting on Jan. 17, and was in continuous session for the rest of the year. After its 23rd meeting on Feb. 16, the council adjourned and reconvened in New York on March 20, 1946.

The members of the Economic and Social council were elected by the general assembly on Jan. 12 and 14. This council held three sessions: the first from Jan. 23 to Feb. 18 in London; the second from May 25 to June 21 at Hunter college, the Bronx, New York; and the third from Sept. 11 to Oct. 3 at the United Nations temporary head-quarters at Lake Success.

Before the Trusteeship council could come into existence, it was necessary in accordance with the terms of the charter that trusteeship agreements should be drawn up and approved by the general assembly (or, in the case of agreements for "strategic areas," the Security council). The charter specified that the Trusteeship council should be composed of those members of the United Nations administering trust territories with, in addition, those permanent members of the Security council not administering trust territories and enough other non-administering states elected by the general assembly to make the membership on the council of administering and nonadministering states equal. It was not until the second part of the general assembly's first session that this condition was fulfilled, and the Trusteeship council established.

The judges of the international court of justice were elected by the general assembly and the Security council, voting independently, on Feb. 6, and the court held its inaugural sitting on April 18. On Feb. 1, the general assembly, on recommendation of the Security council, appointed Trygve Lie as the first secretary-general of the United Nations.

General Assembly—First Part of First Session.—At the first part of its first session, the general assembly held 33 plenary meetings and 102 committee meetings. Paul-Henri Spaak of Belgium was elected president of the first session of the general assembly, and the chief delegates of China, France, the Union of South Africa, the U.S.S.R., the United Kingdom, the United States and Venezuela were elected vice-presidents.

The general assembly established six main committees: political and security; economic and financial; social, humanitarian and cultural; administrative and budgetary; trusteeship; legal. It set up two ad hoc committees: a

League of Nations committee and a permanent headquarters committee. The general assembly established two procedural committees: a general committee and a credentials committee.

As non-permanent members of the Security council, the general assembly elected Australia, Brazil and Poland for a term of two years, and Egypt, Mexico and the Netherlands for a term of one year.

It elected as members of the Economic and Social council the following 18 members: Belgium, Canada, Chile, China, France and Peru for a term of three years; Cuba, Czechoslovakia, India, Norway, the U.S.S.R. and the United Kingdom for a term of two years; Colombia, Greece, Lebanon, the Ukrainian S.S.R., the United States and Yugoslavia for a term of one year.

The general assembly and the Security council, voting independently, elected the following 15 persons as judges of the international court of justice: Alejandro Alvarez (Chile), Jose Philadelpho de Barros Azevedo (Brazil), Jules Basdevant (France), Jose Gustavo Guerrero (El Salvador), Sir Arnold Duncan McNair (United Kingdom), for a term of 9 years; Isidro Fabela Alfaro (Mexico), Green H. Hackworth (United States), Helge Klaestad (Norway), Sergei Borisovich Krylov (U.S.S.R.), Charles de Visscher (Belgium), for a term of 6 years; and Abdel Hamid Badawi Pasha (Egypt), Hsu Mo (China), John E. Read (Canada), Bohdan Winiarski (Poland), Milovan Zoricic (Yugoslavia), for a term of 3 years.

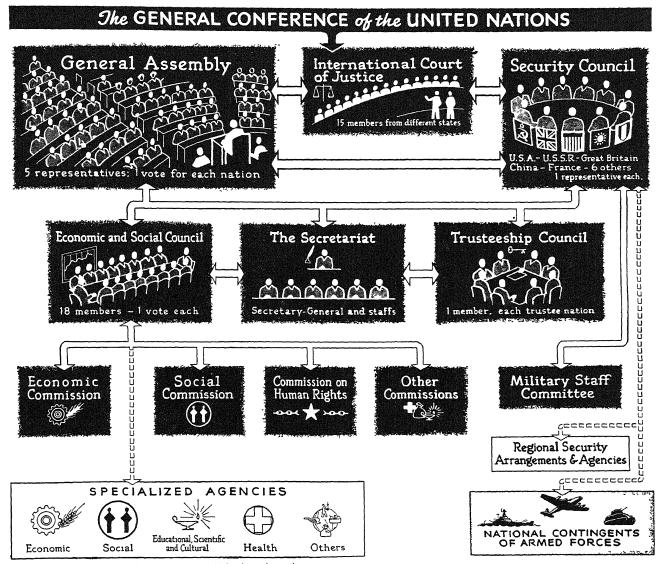

The general assembly decided that members of the councils elected in Jan. 1946 should hold office for 12 months and that elections of their successors should be held at the second part of the general assembly's first session.

Procedural Questions. — Two procedural questions aroused considerable discussion in the general assembly: the composition of the general committee and the question of nominations.

The preparatory commission had recommended that the general committee should consist of the president of the general assembly, the seven vice-presidents and the chairmen of the six main committees. Delegates supporting this recommendation stressed that a small general committee would be more efficient, and that the work of this committee was organizational and not political. On the other hand, certain delegates felt that all delegations should be represented on the general committee, as this would make for more democratic handling of the general assembly's business, and maintained that it would in practice be difficult to define what constituted an important political question. The general assembly decided that the general committee should consist of 14 members, but added a proviso that it should not decide any political question. It also decided that a member which had no representative on the general committee and which had requested the inclusion of an additional item on the agenda should participate without vote at meetings of the general committee when its request was being discussed.

Two opposing views were held on the question of nominations—the one that nominations would prevent the formation of blocs and would make for democratic voting; the other that complete secrecy was the best method of ensuring freedom and independence of vote. After considerable discussion, the general assembly decided that "there shall be no nominations."

A third procedural question decided by the general assembly was the adoption of rules of procedure concerning languages. The rules adopted provided that in all organs of the United Nations other than the international court of justice, Chinese, French, English, Russian and Spanish

Organization of the United Nations, 1945. Unbroken channels represent direct relationship as defined in the Charter. Broken channels represent relationship to be determined

should be the official languages, and English and French the working languages. Speeches made in either of the working languages should be interpreted into the other working language, and speeches made in any of the other three official languages should be interpreted into both working languages. A representative making a speech in a language other than the official languages should himself provide an interpreter into one of the working languages; interpretation into the second working language would be based on the first interpretation.

Political and Security Questions.—The general assembly on Jan. 24, 1946, unanimously adopted a resolution establishing a commission on atomic energy. This resolution had been agreed upon by the Moscow conference of the ministers of foreign affairs of the U.S.S.R., United Kingdom and United States, and the governments of China, France and Canada had agreed to join in sponsoring it. The resolution was adopted without change by the general assembly. The commission was to submit its reports and recommendations to the Security council. They were to be made public unless the Security council in the interest of peace and security directed otherwise. Where appropriate

the Security council was to transmit the reports to the general assembly and other organs of the United Nations. On matters affecting security the commission would receive directions from and be responsible to the Security council. The commission was to be composed of the states represented on the Security council and Canada, when Canada was not a member of the council. Its rules of procedure were to be approved by the Security council.

The commission was to proceed with the utmost dispatch and enquire into all phases of the problems of atomic energy. In particular, it was to make proposals for extending the exchange of basic scientific information for peaceful ends, for controlling atomic energy to the extent necessary to ensure its use only for peaceful purposes, for the elimination of atomic weapons from national armaments and for effective safeguards; e.g., by inspection, against violations and evasions.

The general assembly also recommended that members of the United Nations should "take all the necessary measures" to ensure that war criminals should be arrested and sent back for trial to those countries where their crimes had been committed, and called upon governments not members of the United Nations to take similar steps.

A further resolution endorsed the resolution adopted at the San Francisco conference and the statement made, at

the Potsdam conference to the effect that countries whose governments (i.e., the Franco government in Spain) had been installed with the help of the axis powers were not eligible for membership in the United Nations. It recommended that members should, in the conduct of their future relations with Spain, act in accordance with these statements.

Economic and Social Questions.-Acting on the recommendations of the preparatory commission, the general assembly recommended that the Economic and Social council establish the following commissions: a commission on human rights, an economic and employment commission, a temporary social commission, a statistical commission, a commission on narcotic drugs; and that the council should consider the desirability of establishing the following commissions: demographic commission, temporary transport and communications commission, fiscal commission, coordination commission. Delegates expressed the view that the Economic and Social council should be allowed the widest possible freedom to carry out its work, and that the recommendation to consider setting up a co-ordination commission should not be regarded as a directive. Similarly the preparatory commission's recommendation that the commissions contain a majority of highly qualified governmental representatives was approved on the understanding that it would not be regarded as binding and that no limitation should be put on the council in choosing the members of commissions.

The general assembly recommended that the Economic and Social council should make arrangements for the negotiation of agreements bringing specialized agencies into relationship with the United Nations. It transmitted to the Economic and Social council for guidance in its negotiations a number of observations and a list of items submitted by the preparatory commission and deemed appropriate for inclusion in the agreements.

Requests for participation in the work of the Economic and Social council were received from the World Federation of Trade Unions, the International Co-operative alliance, the International Federation of Women and the American Federation of Labor. In a prolonged debate on the question, it was contended that the World Federation of Trade Unions, representing 65,000,000 workers all over the world, was in a unique position and should be accorded a special status. The general assembly recommended that the Economic and Social council should, as soon as possible, adopt suitable arrangements enabling the World Federation of Trade Unions, the International Co-operative alliance and other international non-governmental organizations, as well as the American Federation of Labor and other national and regional organizations whose experience the council found necessary to use, to collaborate with it for purposes of consultation.

In order to facilitate the final stages of the United Nations Relief and Rehabilitation administration's (U.N.R.R.A) work, the general assembly established a committee to consult with the states signatory to the U.N.R.R.A. agreement and urge them to make the further contribution of 1% of their national income to U.N.R.R.A.'s funds, which had been recommended by the council of U.N.R.R.A. in Aug. 1945. At the same time the committee was to urge members which had not signed the U.N.R.R.A. agreement to join that organization.

After prolonged debate on the subject of refugees and displaced persons in which, on the one hand, the inadequacy of the existing machinery was stressed and, on the other, it was contended that all displaced persons could now return to their homes, the general assembly decided to refer the question to the Economic and Social council for study and report. The assembly drew a distinction between genuine refugees and displaced persons, and traitors and war criminals. It recommended that the council establish a special committee to report on the problem, and outlined certain general principles to be taken into consideration.

The general assembly approved unanimously a draft resolution on the world shortage of cereals presented by the delegations of China, France, the U.S.S.R., the United Kingdom and the United States. It urged all governments and peoples to take immediate and drastic action both directly and through the international organizations concerned to conserve supplies and to ensure maximum production of grain.

A resolution was also adopted recognizing that the problem of full reconstruction of member countries of the United Nations which had suffered substantial war damage was a grave and urgent matter which should be given high priority among postwar problems.

Trusteeship and Non-Self-Governing Territories.-As trusteeship agreements had not yet been submitted, it was not possible for the general assembly to take steps to bring the Trusteeship council into being, but the representatives of the United Kingdom, Belgium, Australia and New Zealand made declarations stating that their governments intended to take steps to place mandated territories under the trusteeship system. The French representative stated that France was studying arrangements for placing the French Camerouns and French Togoland under trusteeship, on the understanding that this would not entail any diminution of the rights of the inhabitants and that the agreements would be submitted to the representative organs of the populations of the territories. The South African representative explained the particular circumstances of the territory of South-West Africa, and stated his government's intention of consulting the people of the territory on the form their future government should take.

The general assembly declared that the obligations undertaken by members under chapter XI of the charter were not contingent on the conclusion of trusteeship agreements.

Administrative and Budgetary Matters.—The general assembly decided that the secretary-general should receive a net salary of \$20,000 with a representation allowance of \$20,000 per annum. In addition he should be provided with a furnished residence. The first secretary-general was to be appointed for five years, renewable for a further five-year term. It was agreed that the general assembly and the Security council were free to modify the term of office of future secretaries-general.

The general assembly resolved that there should be eight principal units of the secretariat, as proposed by the preparatory commission, each under an assistant secretary-general. It authorized the secretary-general to appoint assistant secretaries-general and such other officials and employees as were required and to prescribe their responsibilities and duties.

Salaries of assistant secretaries-general were fixed at \$13,500 (U.S.) net, with a representation allowance varying at the secretary-general's discretion from \$7,000 (U.S.) to \$11,500 (U.S.). Top-ranking directors were to receive a net salary of \$11,000 (U.S.) with an allowance varying from \$3,000 (U.S.) to \$6,000 (U.S.) at the secretary-general's discretion.

The general assembly adopted a provisional budget of \$21,500,000 for the financial year 1946, and established a

working capital fund of \$25,000,000 to cover the expenses of the organization during the first year as provided in the budget. It established a provisional scale of advances to the working capital fund, and approved the provisional financial regulations submitted by the preparatory commission. The secretary-general was instructed to prepare the first and second annual budgets, and a committee on contributions was appointed to prepare a scale for the apportionment of expenses among the members of the United Nations.

Legal Matters.—The general assembly adopted and proposed for accession by members a convention on the privileges and immunities of the United Nations. The convention provided that the United Nations should possess juridical personality; that its property and assets should enjoy immunity from legal process except when that immunity was waived; that the premises and archives of the United Nations should be inviolable, and that its property and assets should be free from all direct taxes and customs duties. The United Nations was to enjoy in the territory of each member treatment not less favourable for its official communications than that accorded by the government of that member to any other government. No censorship was to apply to United Nations official correspondence, and the United Nations was to have the right to use codes and dispatch and receive its correspondence by courier or in bags. The representatives of members, officers of the United Nations and experts on missions for the United Nations were to enjoy such immunities and privileges as were necessary for the independent exercise of their functions. The United Nations was to be entitled to issue a laussezpasser to its officials. Provision was made in the convention for the settlement of disputes which might arise out of contracts of a private law character to which the United Nations was a party.

The secretary-general was authorized to negotiate, subject to approval by the general assembly, the arrangements required as a result of the establishment of the seat of the United Nations in the United States of America. A committee was appointed to assist him in the negotiations, and a draft convention was approved by the assembly as a basis for discussion.

The general assembly instructed the secretary-general to open negotiations for the reconsideration of the privileges and immunities of specialized agencies, with a view to coordinating them with those of the United Nations. It invited the members of the international court of justice to make recommendations concerning the privileges, immunities and facilities necessary for the exercise of the court's functions.

The general assembly fixed the salaries of the president, vice-president and members of the court at 54,000 Netherlands florins. The president was in addition to have a special allowance of 15,000 Netherlands florins and the vice-president an allowance of 100 florins for every day on which he acted as president, up to a maximum of 10,000.

The secretary-general was instructed to take the necessary steps to summon a first meeting of the court at The Hague as soon as possible after the election of the members; to appoint a secretary and other necessary temporary officers pending the appointment of the court's registrar and officers; and to conduct preliminary negotiations with the board of directors of the Carnegie foundation to fix conditions, subject to the general assembly's approval, on which the premises in the Peace palace required by the court could be placed at its disposal.

League of Nations.—The general assembly dealt with the transfer of functions, activities and assets of the League

of Nations under these headings: functions and powers belonging to the league under international agreements; other non-political functions and activities and assets.

The assembly declared that the United Nations was willing to undertake certain functions and powers entrusted to the League of Nations under international agreements. Such functions would include the custody of documents and the performance of functions pertaining to a secretariat. It declared itself willing to take the necessary measures to ensure the continued exercise of certain non-political functions and powers of the league, subject to a careful examination of which organ of the United Nations or which specialized agency should be entrusted with these functions and powers, and referred the matter to the Economic and Social council. The assembly decided to examine any request that the United Nations should take over functions or powers of the league under international agreements of a political character.

The Economic and Social council was requested to survey those functions and activities of a non-political character, other than those exercised under international agreements, to determine which of them should be assumed by organs of the United Nations and which should be entrusted to specialized agencies. The council was provisionally to assume the work done by the following league departments: the economic, financial and transit department, particularly the research and statistical work; the health section, particularly the epidemiological service; the opium section and the secretariats of the Permanent Central Opium board and supervisory body.

The assembly requested the secretary-general to make provision for taking over and maintaining in operation the library and archives of the League of Nations and for completing the league treaty series.

The general assembly approved the common plan for the transfer of the league assets agreed upon between the committee established by the preparatory commission and

Recording the verbal proceedings of the United Nations at Hunter college, New York city. Sound filming and phonograph recording were supervised by U.S. army technicians

the supervisory commission of the League of Nations. This provided for the transfer on or about Aug. 1, 1946, of all material assets of the league in accordance with an agreed valuation. The shares in the total credit established were to be distributed between states entitled to participate in accordance with percentages to be laid down by the league at its next assembly. The shares of states which were members of the United Nations were to be credited to them in the books of the United Nations, and the purpose to which they were to be applied was to be decided by the general assembly.

It was agreed that the International Labour organization could use the Assembly hall, with the necessary committee rooms and office accommodation, on financial terms to be agreed between that organization and the United Nations. The International Labour organization was to use the library under the same conditions as other official users.

The League of Nations undertook to discharge its obligations as soon as practicable, to settle the question of contributions of member states in arrears, and to separate the interests of the International Labour organization in the assets of the league, before transfer to the United Nations.

Work of Ad Hoc Committees.—League of Nations Assets.—A preliminary agreement was reached on March 5 by the negotiating committee on League of Nations' assets with the directors of the Carnegie foundation for the use of the premises in the Peace palace at The Hague. On April 19 an agreement on the Ariana site and an interim arrangement on the privileges and immunities of the United Nations in Switzerland were signed by the United Nations and the Swiss authorities. These agreements were subject to the approval of the general assembly.

The common plan for the transfer of the League of Nations assets to the United Nations was approved by the league assembly on April 18, 1946, and the following arrangements were made:

It was agreed that the buildings would be transferred on July 31, 1946. Until that date maintenance costs would be borne by the League of Nations and afterward by the United Nations. The total value of the contents at the date of transfer would be agreed between the two secretaries-general. The library of the League of Nations would continue to function in Geneva until the question of its transfer was considered in connection with the permanent headquarters of the United Nations. Extended use would be made of photostatic and microfilm processes for copying books and documents required in New York and elsewhere, and the staff would be increased for this purpose.

Headquarters.—The representatives of the secretary-general sent to New York to find an interim headquarters were of the opinion that Hunter college was the best available site to provide a meeting place for the Security council, the Economic and Social council and its commissions and to house the secretariat. A lease was signed on March 6 taking over the premises at Hunter college until May 15, 1946. The Hunter college gymnasium was converted into a council chamber for the Security council and the Economic and Social council.

On April 11 the mayor of New York offered to make available the City building at Flushing meadow for the general assembly if the secretariat would move to the Sperry plant at Lake Success. The mayor announced that the city was ready to expend \$1,200,000 on the Flushing meadow site. This offer was accepted on the same day, and at the same time a request was made to extend the lease of Hunter college from May 15 to Aug. 15, 1946.

A lease was taken of certain parts amounting to approximately 572,000 sq.ft. of the Sperry plant for a period of 3 years from July 1, 1946, with an option to renew for 2 further years, and the secretariat and councils were moved there on Aug. 15. The City building at Flushing meadow was altered for the general assembly to meet there on Oct. 23. New York city contributed \$1,010,000 for the alterations to the City building and \$900,000 for the roads and grounds.

Meantime the headquarters commission studied possible sites for a permanent headquarters on the basis of the desiderata laid down by the general assembly. The commission considered 25 potential sites and selected 15 for closer study—3 of each size (2, 5, 10, 20 and 40 sq.mi.) specified by the general assembly. Finally one site in each group was judged to be the best for its size. The final recommended sites were all in Westchester county.

The Security Council.—From its first meeting on Jan. 17, 1946, until the end of Dec. 1946 the Security council held 88 meetings, during which political, organizational and procedural matters were discussed.

The permanent members of the Security council were China, France, the U.S.S.R., the United Kingdom and the United States. The following non-permanent members were elected by the general assembly at the first part of its first session: Egypt, Mexico and the Netherlands for one year; and Australia, Brazil and Poland for two years. At the second part of its first session the general assembly elected Belgium, Colombia and Syria to replace Egypt, Mexico and the Netherlands, retiring members.

At its first meeting the Security council set up a committee of experts. At its second meeting the council adopted a directive to the military staff committee. The proceedings of the committee of experts and of the military staff committee are dealt with later.

On Jan. 31, 1946, the council unanimously recommended to the general assembly the appointment of Trygve Lie as secretary-general of the United Nations. On Feb. 6 the Security council and the general assembly, voting independently, elected the judges of the international court of justice.

The political questions dealt with by the Security council were concerned with Iran, Greece and the Balkans, Syria and Lebanon, and Spain.

The Iranian Question.—In a letter of Jan. 19, 1946, the representative of Iran to the United Nations brought to the attention of the Security council a situation which might lead to international friction owing to the interference of the soviet union in Iranian internal affairs. The complaint was considered at the council's third and fifth meetings, the Iranian representative participating in the discussion. The soviet representative denied interference and stated that the soviet union was willing to resume direct negotiations with the Iranian government. The council unanimously resolved on Jan. 30, 1946, that since both parties had expressed their readiness to solve the matter by negotiation, the council should be kept informed of such negotiations, while retaining the right to request information on their progress.

In a letter dated March 18, 1946, the Iranian ambassador to the United States brought to the attention of the Security council a dispute between Iran and the soviet union. He stated that the soviet union was maintaining troops in Iran after March 2, contrary to the provisions of the Tripartite Treaty of Alliance between the soviet union, the United Kingdom and Iran of Jan. 29, 1942, and alleged the continued intervention of the soviet union in the internal affairs of Iran.

The application was discussed at the 25th to the 30th meetings. Soviet objections to the inclusion of the matter on the agenda on the ground that negotiations were still proceeding were rejected by the council, as was also a request for postponing examination of the matter until April 10. The soviet representative stated that he was unable to participate in the discussion and left the council chamber. The Iranian ambassador was invited to take part in the discussion. On April 4 the council resolved, the representative of the soviet union being absent and the representative of Australia abstaining, to defer further proceedings until May 6, at which time the soviet and Iranian governments were requested to report to the council whether the withdrawal of all soviet troops from the whole of Iran had been completed.

By a letter dated April 6, 1946, the soviet representative proposed that the Iranian question be removed from the Security council's agenda on the ground that an understanding had been reached between the soviet and Iranian governments on the evacuation of soviet troops from Iran. On April 15, 1946, the Iranian ambassador also stated that his government withdrew its complaint. At the 32nd and 33rd meetings, the Security council examined the question of the removal of the Iranian appeal from the agenda, and the secretary-general submitted a memorandum on the matter in which the opinion was expressed that the council under the circumstances could not remain seized

Andrei Gromyko resuming his seat at the United Nations security council on April 9, 1946, after boycotting several sessions in protest over the presence of the Iranian question on the agenda

of the question. The council referred this memorandum to the committee of experts which submitted a report in which it was stated that it had been unable to reach a common opinion on the arguments advanced by the secretary-general. The report was considered by the council at its 36th meeting. A French resolution requesting the secretary-general to collect the necessary information to complete the Security council's report on the case to the general assembly was defeated and the council remained seized of the question. The soviet representative stated this was contrary to the charter and that his delegation could not take any further part in the discussion.

By a letter dated May 6, the Iranian ambassador reported the withdrawal of soviet troops from certain Iranian provinces. Regarding Azerbaijan, the Iranian government had been unable to verify by direct observation reports of its evacuation. At the 40th meeting on May 8, the council decided (the soviet representative being absent) to defer proceedings in order to allow the Iranian government to ascertain whether all soviet troops had been withdrawn from the whole of Iran. The Iranian government was requested to submit a complete report on the subject immediately it obtained the necessary information and in any case to report by May 20.

On May 20 and 21 the Iranian ambassador submitted the information asked for by the council. In his letter of May 21, he stated that, according to investigations, soviet

troops had evacuated Azerbaijan on May 6, 1946. At the council's 43rd meeting on May 22, it was resolved to adjourn "until a date in the near future" discussion of the Iranian question.

First Greek Question.—By a letter of Jan. 21, 1946, the soviet representative brought to the attention of the Security council the situation in Greece, on the grounds that the presence of British troops in Greece after the termination of World War II constituted an interference in the internal affairs of Greece and caused tension fraught with grave consequences both for the Greek people and for the maintenance of peace and security.

The matter was brought up at the sixth meeting of the council on Feb. 1, 1946, and a final decision was taken on Feb. 6 at its tenth meeting. A representative of Greece participated without vote in the discussion.

The representative of the United Kingdom stated that British troops were in Greece after previous agreement with an all-party Greek government and with Marshal Stalin. If the Greek government decided that British troops were not wanted, they would not impose themselves upon them. He demanded that the council say whether the British government, by lending some of its forces, at the request of the Greek government, to secure order and economic reconstruction in Greece, had endangered peace. The representative of Greece denied that there had been any intervention in the internal affairs of Greece, âdding that the Greek people regarded the continued presence of British forces in Greece as a factor in the consolidation of public order and security and full restoration of normal political conditions.

On Feb. 6 the president made a statement taking note of the views of members, and considering the matter as closed. This was found satisfactory.

Second Greek Question.—By a telegram of Aug. 24, 1946, the foreign minister of the Ukrainian S.S.R. called the attention of the Security council to the situation in the Balkans resulting from the policy of the Greek government which, he considered, constituted a grave danger to peace and security in this part of Europe. Border incidents allegedly provoked by Greek troops, mainly on the Greek-Albanian border, and the persecution of minorities in northern Greece were mentioned. It was stated that the principal factor conducive to this situation was the presence of British troops in Greece.

The matter came up for discussion at the 58th meeting of the council on Aug. 30, 1946. The representatives of Greece and the Ukrainian S.S.R. were invited to take part in the discussion without vote. Debate on this question continued until the 70th meeting of the council.

The Ukrainian representative developed the charges contained in the telegram. The representative of Greece rejected them, stating that if a threat to peace existed in the Balkans, it should be sought outside the confines of Greece. The representative of Albania was invited to state his views at the 64th meeting on Sept. 9.

On Sept. 20, at the 70th meeting, four draft resolutions were put to vote. A soviet resolution condemning the Greek government and requesting it to cease its provocative activities was not accepted by the council, which also rejected a Netherlands proposal calling on Greece and Albania to do their utmost to stop frontier incidents, and a Polish proposal to keep the matter under observation, and to retain it in the list of matters of which the council remains seized. A United States resolution proposing to send a commission of three individuals to investigate bor-

der incidents along the frontier between Greece on the one hand and Albania, Bulgaria and Yugoslavia on the other was not adopted by the council because of the negative vote of the soviet representative. The Greek question was considered closed.

The Balkan Question.—By a letter of Dec. 3, 1946, the acting chairman of the Greek delegation to the general assembly called to the attention of the Security council the situation in northern Greece resulting from the aid provided by Greece's northern neighbours to armed bands operating there.

The Greek complaint was brought up at the 82nd meeting of the council on Dec. 10, 1946, and a final decision was taken on Dec. 19 at the 87th meeting.

The representatives of Greece and Yugoslavia were invited to participate in the discussion without vote. The representatives of Albania and Bulgaria were invited to make statements on the matter, and on the council's decision that the question under examination was a dispute, were also asked to participate in the discussion without vote

The Greek representative developed the charges made, and Yugoslav, Albanian and Bulgarian representatives denied them, declaring that the responsibility for the situation in northern Greece lay with the policy of the Greek government.

At the 85th meeting of the council on Dec. 18, the representative of the United States formally proposed the establishment of a commission of investigation to proceed to the area and submit a report of its findings to the council. At the 87th meeting on Dec. 19, 1946, the United States proposal was adopted by the council with two amendments proposed by the representatives of Mexico and Poland, respectively. By this resolution a Balkan commission was established, consisting of one representative of each member of the Security council. The commission was to proceed to the area not later than Jan. 15, 1947, and conduct investigations in northern Greece and in other parts of Greece which it believed should be included, and also in Albania, Bulgaria and Yugoslavia. It was to submit a report at the earliest possible date and to make any proposals it deemed wise for averting a repetition of border violations and disturbances in these areas.

The Indonesian Question.—By a letter of Jan. 21, 1946, the representative of the Ukrainian S.S.R. brought to the attention of the Security council a situation in Indonesia, which, it was alleged, created a threat to the maintenance of international peace and security.

The letter was placed on the agenda of the 12th meeting of the Security council on Feb. 7, 1946. The Ukrainian representative was invited to participate in the discussion without right of vote. He stated the case against the intervention of British and Indian troops to repress the popular movement in Indonesia. The representative of the United Kingdom denied that British troops were in Indonesia for the suppression of the Indonesian national movement. The Netherlands representative stated that there was no "dispute" or "situation" threatening peace and security with which the Security council was competent to deal.

A Ukrainian resolution, presented at the 18th meeting on Feb. 13, 1946, proposed the establishment of a commission of inquiry. This was lost, as was also an Egyptian proposal stating that British troops in Indonesia should only be used for the united purposes which brought about their presence there and that the council should be informed of the results of negotiation between the Netherlands government and the chiefs of the Indonesian movement. A soviet amendment to this resolution providing for a commission

The Syrian and Lebanese Question.—By a letter of Feb. 4, 1946, the heads of the Lebanese and Syrian delegations to the United Nations brought to the attention of the Security council the presence of French and British troops in Syria and the Lebanon. The letter stated that the governments of Syria and the Lebanon had expected that these troops would be withdrawn immediately on the cessation of hostilities with Germany and Japan, but that a Franco-British agreement of Dec. 13, 1945, made the withdrawal of troops subject to conditions which were inconsistent with the spirit and the letter of the charter.

The question was discussed at the 19th to 23rd meetings of the council, Feb. 14, 15, 16, 1946, and the representatives of Syria and the Lebanon participated in the discussion without vote. Several resolutions were presented and defeated, one submitted by the United States representative receiving seven votes. This resolution expressed the confidence of the council that foreign troops in Syria and the Lebanon would be withdrawn as soon as practicable and that negotiations to that end would be undertaken by the parties without delay. It also requested the parties to inform the council of the results of the negotiations. Since the soviet representative had not voted in favour of this resolution, it was not adopted, but the representatives of France and the United Kingdom stated that their governments would give effect to this decision of the council.

The French and British governments entered into negotiation with the governments of Syria and the Lebanon, reporting on the matter to the council by letters of April 30 and May 1, respectively. By a telegram dated May 19, 1946, the Syrian prime minister and minister for foreign affairs stated that the evacuation of foreign troops from Syrian territory had been completed during the first two weeks of April 1946. By a letter of May 9, 1946, the Lebanese minister for foreign affairs stated that the negotiations with the French foreign minister had resulted in an agreement established by an exchange of letters of March 23, 1946. In conclusion, he stated his government's satisfaction with the outcome of the negotiations.

The Spanish Question.—By letters of April 8 and 9, 1946, the representative of Poland brought to the attention of the Security council the situation arising from the existence of the Franco regime in Spain. When the matter was brought up at the 34th meeting on April 17, 1946, the Polish representative formally proposed that the Security council should declare that the existence and the activities of the Franco regime in Spain had led to international friction and endangered international peace and security, and should call upon all members of the United Nations which maintained diplomatic relations with the Franco government to sever such relations immediately.

At the 39th meeting an Australian resolution was adopted by the council providing for the appointment of a sub-committee of five to examine the Spanish question. It was agreed that the sub-committee should be composed of the representatives of Australia (chairman), Brazil, China, France and Poland.

By May 31, 1946, the sub-committee completed its report, which was submitted to the council at its 44th meeting on June 6, 1946. Its conclusions were that the activities of the Franco regime constituted a potential menace to international peace and security and that the Security council was therefore entitled to recommend appropriate procedures or methods of adjustment to improve the situation.

The sub-committee also recommended that the Security council endorse the principles contained in the declaration by the governments of the United Kingdom, the United States and France of March 4, 1946; that the council transmit to the general assembly the evidence and reports of the sub-committee with the recommendation that unless the Franco regime was withdrawn and other conditions of political freedom set out in the declaration were, in the opinion of the general assembly, fully satisfied, a resolution be passed by the assembly recommending the severance of diplomatic relations with the Franco regime by each member of the United Nations.

At the 45th meeting, on June 13, the recommendations of the sub-committee were put to vote at the proposal of the sub-committee's chairman. They were not adopted because of the negative vote of the representative of the soviet union. At the 48th meeting, on June 24, 1946, the original resolution proposed by the Polish representative was put to the vote and was lost.

A new Polish resolution was introduced, proposing that the situation in Spain should be kept under continuous observation, and that it should remain on the list of matters of which the council was seized. Moreover, the Security council should take up the matter not later than Sept. 1, 1946. After the proposal of certain amendments by the representative of the United Kingdom, a drafting committee of Australia, Poland and the United Kingdom was appointed to prepare an agreed text. The drafting committee reported at the 49th meeting of the Security council on June 26 that its 3 members had been unable to agree on a text.

The Security council decided to keep the situation in Spain under continuous observation, in order to be ready at all times to take such measures as might become necessary to maintain international peace and security. Any member of the council could bring the matter up for consideration by the council at any time.

A resolution proposed by the representative of Australia that the resolution adopted did not prejudice the rights of the general assembly under the charter was then put to vote. As the soviet representative voted against it, the resolution was not carried.

At its 79th meeting on Nov. 4, 1946, the Security council unanimously decided to delete the Spanish question and to place at the disposal of the general assembly all records and documents of the case in order to enable the assembly to make recommendations on the matter.

Polish Emigré Army in Italy.—By a letter of Feb. 15, 1946, the soviet representative brought to the attention of the Security council the movements and activities of the Polish emigré army in Italy which the Yugoslav government regarded as detrimental to peaceful Yugoslav-Italian relations.

Border Incidents between Siam and Indo-China.—On May 31, 1946, the chargé d'affaires of Siam in Washington brought to the attention of the council a number of border incidents between Siam and the French authorities in Indo-China.

Armed Forces of the United Nations on Territories of Other States.—At the 57th meeting of the Security council on Aug. 29, 1946, the soviet representative proposed that the council request the members of the United Nations to submit within two weeks information on the number and location of their armed forces on the territory of other United Nations members or other states, not including former axis territories. After discussion at the 71st and 72nd meetings on Sept. 23 and 24, 1946, the Security council decided not to place the matter on the agenda.

Other Matters Considered by the Security Council.—Admission of New Members.—Up to Dec. 30, 1946, the Security council had received the applications of the following countries for membership in the United Nations: (1) Albania, Jan. 25, 1946; (2) Siam, May 20, Aug. 5 and Nov. 29; (3) Mongolian People's Republic, June 24; (4) Afghanistan, July 2; (5) Trans-Jordan, July 8; (6) Eire, Aug. 2; (7) Portugal, Aug. 2; (8) Republic of Iceland, Aug. 2; (9) Sweden, Aug. 9.

At its 42nd meeting, on May 17, 1946, the Security council decided to refer all applications for membership to a committee composed of representatives of each of the members of the council for examination.

The committee on the admission of new members met on July 31 and held its 14th and last meeting on Aug. 20. The Security council considered the committee's report at its 54th, 55th, 56th, 57th and 58th meetings on Aug. 28–29, 1946. The question of recommending the admission of all applicants en bloc was discussed and it was decided to study each application separately and in the chronological order in which they were submitted. The council then proceeded to discuss the merits of each applicant and unanimously recommended Afghanistan, Iceland and Sweden for membership in the United Nations. The other applicants were not recommended, Albania and Mongolia not securing the necessary majority, and the U.S.S.R. voting against Portugal, Trans-Jordan and Eire.

On Aug. 28, Siam requested that consideration of its application be adjourned pending settlement of a territorial dispute with France. It applied anew on Nov. 29 for membership in the United Nations. At its 83rd meeting on Dec. 12, the Security council unanimously recommended its admission to the United Nations.

Following a request from the general assembly, the Security council at its 81st meeting instructed the committee of experts to name a small committee from its own members to confer with a committee on procedures of the general assembly to prepare rules on the admission of new members acceptable to both council and assembly. The committee was to report back to the Security council. China, Brazil and Poland were appointed to the committee.

At the same meeting the Security council decided to adopt the general assembly's recommendation that it should re-examine the application for membership in the United Nations of Albania, Trans-Jordan, the Mongolian People's Republic, Eire and Portugal, on their respective merits. On Dec. 10, however, the president of the council announced that informal consultation among the members of the council indicated general agreement that consideration of these applications should be deferred.

Non-members and the International Court of Justice.— By a letter of May 1, 1946, the president of the court of international justice requested the Security council to define the conditions under which the court would be open to other states in accordance with article 35, paragraph 2 of the statute.

At its 50th meeting on July 10 the council referred the matter to the committee of experts. At its 76th meeting on Oct. 15, the council unanimously adopted a resolution on the matter submitted by the committee of experts.

The resolution stated that the court would be open to a state which was not a party to the statute on condition that it had previously deposited with the registrar of the court a declaration accepting the court's jurisdiction in accordance with the charter and under the terms and conditions of the statute and rules of the court, undertaking to

comply with the court's decisions and to accept the obligations of a member of the United Nations under article 94 of the charter. This declaration might be made in respect of a particular dispute or disputes or might be general.

By a letter of Oct. 26, 1946, the Swiss consul general in New York brought to the attention of the Security council and of the general assembly the desire of the Swiss Federal council to know the conditions under which Switzerland could become a party to the statute of the international court of justice. This matter was referred by the Security council to the committee of experts, whose report the council adopted at its 80th meeting on Nov. 15, 1946. The council's recommendations were adopted by the general assembly.

The Military Staff Committee.—By article 47 of the charter, the United Nations agreed to the establishment of a military staff committee to advise and assist the Security council. It was to consist of the chiefs of staff of the permanent members of the Security council or their representatives. At its second meeting on Jan. 25, 1946, the Security council adopted a directive for the establishment of the committee.

The committee met in London on Feb. 4, 1946. It adjourned on Feb. 14 and reconvened in New York on March 25. The committee, as instructed by the council, drew up proposals on its organization and procedure and submitted them to the council for approval. At the council's 23rd meeting on Feb. 16, 1946, it instructed the committee of experts to examine the report. Pending approval of the report by the council, the military staff committee was authorized to carry on its business along the lines suggested.

At the same meeting the Security council directed the military staff committee, as its first task, to examine from the military point of view the provisions of article 43 of the charter concerning the conclusion of an agreement or agreements between the United Nations for making available to the Security council armed forces, assistance and facilities for the maintenance of international peace and security.

The military staff committee by Dec. 1946 had concluded consideration of the principles governing the composition of the armed forces to be made available to the Security council by members of the United Nations, and began consideration of the principles which should govern the strength of these forces.

Atomic Energy Commission.—On Jan. 24, 1946, the general assembly of the United Nations unanimously resolved to establish a commission to deal with the problems of atomic energy and related matters. This commission was to be composed of one representative of each of the states represented on the Security council and Canada when the latter was not a member of the Security council. The commission was requested to submit its report and recommen dations to the Security council.

The Atomic Energy commission first met on June 14, 1946, and held ten meetings up to Dec. 31, 1946. A committee on rules of procedure was appointed at the first meeting and the draft rules submitted by it were approved by the commission on July 3 and by the Security council on July 10, and were officially adopted by the commission at its fifth meeting on July 18.

At the first meeting of the Atomic Energy commission, the representative of the United States presented a plan for the creation of an International Atomic Development authority entrusted with all phases of the development and use of atomic energy. The authority would conduct continuous surveys of world supplies of uranium and thorium, and would bring the raw materials under its domin-

ion. It would control and operate all primary plants producing fissionable products in dangerous quantities. It would possess exclusive right to conduct research in the field of atomic explosives, and all other research would be open only to nations under licence of the authority which would furnish them with denatured materials. Dangerous activities of the authority and its stockpiles would be decentralized and strategically distributed. All nations would grant the freedom of inspection deemed necessary by the authority. The representative of the United States stressed the importance of immediate punishment for infringements of the rights of the authority.

At the second meeting of the commission on June 19, 1946, the representative of the U.S.S.R. suggested that the first measure to be adopted should be the conclusion of an international agreement to forbid the production and use of atomic energy weapons. Within three months from the entry into force of the agreement, all atomic weapons should be destroyed. Violation of the agreement would be considered a serious threat against humanity and would be severely punished under the domestic legislation of the contracting parties. The agreement should be of indefinite duration, coming into force after approval by the Security council and ratification by its permanent members. All states would be obliged, whether or not members of the United Nations, to fulfil all provisions of the agreement.

After various delegations had expressed their views on the two proposals, it was decided to establish a working committee to consider the proposals made and to establish, if necessary, sub-committees.

The working committee set up: (1) sub-committee 1 to study all proposals put forward by the delegations to the commission and to prepare the framework of a working plan by presenting to the working committee a list of headings or topics to be considered; (2) committee 2 to examine questions associated with the control of atomic energy activities and to make specific recommendations for such control; (3) a legal advisory committee to examine the legal aspects of atomic energy control; (4) a scientific and technical committee to advise on the scientific aspects of the problem.

Sub-committee 1 held three informal meetings during July 1–11, and presented a report to the working committee on the results of its discussions. Committee 2 continued the work begun in the working committee and sub-committee 1 and examined at length the proposals made. At its fourth meeting on July 31, it decided that before proceeding with further discussions, it was advisable to clarify the scientific and technical facts underlying control of atomic energy. It requested, therefore, the scientific and technical committee to prepare a report on the question of whether effective control of atomic energy was possible, together with an indication of the method by which it considered that effective control could be achieved. On Aug. 2, committee 2 deferred further meetings until it had received the report of the scientific and technical committee.

After eight weeks of intensive study, the scientific and technical committee, on Sept. 26, 1946, unanimously adopted a report for submission to committee 2. The scientific and technical committee concluded that it did not find a basis in the available scientific facts for supposing that effective control of atomic energy was not technologically possible. Whether or not it was politically feasible was for the Atomic Energy commission to decide.

At its sixth meeting on Oct. 2, committee 2 considered the report of the scientific and technical committee and decided to continue its discussions on the basis of the report. At its seventh meeting on Oct. 8, committee 2 unanimously

decided to examine and report on the safeguards required at each stage in the production and use of atomic energy for peaceful purposes to prevent the possibilities of misuse. In accordance with this decision, a program of work was outlined by the secretariat and adopted by committee 2 at an informal meeting on Oct. 14. Under this outline, committee discussions on safeguards to prevent diversions of materials would follow a seven-step plan: uranium and thorium mines, concentration plants, refineries, chemical and metallurgical plants, primary reactors and associated chemical separation plants, isotope separation plants and secondary reactors.

On Oct. 15 at an informal meeting of committee 2, the representative of the U.S.S.R. proposed that atomic energy control should begin at the most basic stage—unmined mineral resources—and called for a world-wide report on uranium deposits. From that date, informal conversations were held about twice weekly to discuss in detail the types of necessary safeguards and to hear statements by experts. The discussions resulted in a draft report completed Dec. 13 dealing with safeguards against diversions and clandestine activities.

In the meanwhile the legal advisory committee held three meetings (June 18 and 30 and Aug. 2). With the assistance of the secretariat, it drew up a provisional list of topics under these headings: (1) drafting, including ultimately the preparation of a draft treaty or treaties; (2) the study of specific legal questions arising in the course of the work of the commission and its committees; (3) the study of the relationship between the system of measures of control recommended by committee 2 and the United Nations. This was submitted to the working committee, with a request for guidance on the next stage of the committee's work so that it might be co-ordinated with the work of other committees. The working committee considered the matter on Aug. 9 and decided that it was not necessary for the legal advisory committee to make recommendations on topics on the provisional list until further advised by the working committee.

At its sixth meeting on Nov. 13, 1946, the Atomic Energy commission decided by ten affirmative votes with two abstentions to submit to the Security council before Dec. 31, 1946, a report on its work, its findings and recommendations. Committee 2 was requested to draft the report.

While this report was being prepared, the second part of the first session of the general assembly was considering various proposals concerning the regulation and reduction of armaments, including atomic weapons. At the Atomic Energy commission's seventh meeting on Dec. 5, the chairman of the commission invited comments on the implications for the commission of the assembly discussion. The sense of the meeting was that the chairman should convey to the appropriate committees of the general assembly the view of the commission that its work should not be judged and that no action should be taken which would preclude or delay the commission from the early completion of its work.

At the same meeting, the United States representative put forward a resolution on the principles to be included in the findings and recommendations of the report of the commission to the security council. These proposals, based, as were the first United States proposals, on the prospective establishment of an International Atomic Development authority, were discussed at the eighth and ninth meetings of the commission on Dec. 17 and 20.

At the latter meeting, the United States draft resolution

was modified by a Canadian amendment, slightly revised at the suggestion of the Mexican representative. According to the Canadian amendment, the commission resolved that, for drafting purposes, the principles on which the United States resolution was based and not necessarily its exact text should be incorporated by the working committee in the report in order that the wording be in conformity with that used in the relevant parts of the text of the general assembly resolution of Dec. 14 on the principles governing the general regulation and reduction of armaments. According to the amendment proposed by the Mexican representative, it was stated in the resolution that these proposals had been made by the United States representative. The United States resolution, as amended, was adopted by the commission. Poland abstained from voting. The representative of the U.S.S.R., who had declared that he would not take part in the discussion, did not participate in the voting. The working committee was instructed to include these proposals in the draft of the commission report to be submitted to the Security council.

The report described the work of the commission, approved the report of the scientific and technical committee on scientific and technical aspects of control and the report of committee 2 on safeguards to ensure the use of atomic energy only for peaceful purposes, and made recommendations. In its general findings, it stated that scientifically, technically and practically it was feasible to extend among all nations the exchange of basic scientific information on atomic energy for peaceful ends; to control atomic energy to the extent necessary to ensure its use only for peaceful purposes; to accomplish the elimination from national armaments of atomic weapons; and to provide effective safeguards by way of inspection and other means to protect complying states against the hazards of violations and evasions. It was also stated that an effective system for control of atomic energy must be international and must be established by an enforceable multilateral treaty or convention which in turn must be administered and operated by an international organ or agency within the United Nations. An international agreement to outlaw national production, possession or use of atomic weapons was considered as essential for an international system of control or inspection but would not be sufficient to ensure the use of atomic energy for peaceful purposes or to provide effective safeguards to protect complying states against the dangers of violations and evasions.

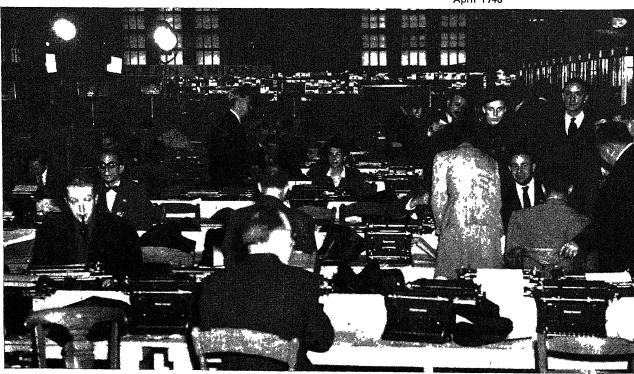

Based upon its findings, the commission recommended the creation of a strong and comprehensive international system of control and inspection by a treaty or convention in which all members of the United Nations would participate on fair and equitable terms. This treaty should include provisions establishing an international authority possessing powers and the responsibility necessary and appropriate for the prompt and effective discharge of its duties imposed upon it by the terms of the treaty or convention. The treaty should provide that the rule of unanimity of the permanent members of the Security council should have no relation with the work of the authority.

The authority would promote among all nations the exchange of basic scientific information on atomic energy and should have positive responsibilities of research and development in order to promote the beneficial uses of atomic energy and eliminate the destructive ones. It would establish safeguards against the dangerous use of atomic energy but would not interfere with the prosecution of pure scientific research or the publication of its results.

Decisions of the authority, however, should govern the operations of national agencies for atomic energy with the minimum interference.

The treaty or convention would also provide the representatives of the authority with unimpeded rights of ingress, egress and access for the performance of their inspections. It would prohibit the manufacture, possession and use of atomic weapons by all nations which were

Correspondents at work in the United Nations pressroom at Hunter college, New York, N.Y., during meetings of the Security council in April 1946

parties to the treaty and would provide for the disposal of any existing stocks of atomic weapons and for the proper use of fissionable materials.

The treaty would also specify the methods of determining violations of its terms and would establish the measures of enforcement or swift and certain punishment for violators. Enforcement and punishment of violators would not be subject to veto.

Finally, the treaty should provide a schedule for the completion of the transitional process leading step by step to the full and effective establishment of international control of atomic energy.

Economic and Social Council.—The Economic and Social council held its first session from Jan. 23 to Feb. 18, 1946, in London; its second session from May 25 to June 21 at Hunter college in New York city; and its third session from Sept. 11 to Oct. 3 at Lake Success.

The initial members of the council, elected by the general assembly on Jan. 12 and 14, 1946, were: Belgium, Canada, Chile, China, France and Peru for a three-year term; Cuba, Czechoslovakia, India, Norway, U.S.S.R. and United Kingdom for a two-year term; and Colombia, Greece, Lebanon, Ukrainian S.S.R., United States and Yugoslavia for one year.

To replace the members who were to serve for a oneyear term the general assembly on Nov. 19 and Dec. 7 and 12 elected the following six states: Byelorussian S.S.R., Lebanon, New Zealand, Turkey, United States and Venezuela. As there had been a tie vote between Turkey and the Netherlands, Belgium offered to resign so that both countries could be elected. On Dec. 12 the general assembly elected the Netherlands to fill the vacancy caused by the resignation of Belgium.

The council at its first session elected Sir Ramaswami Mudaliar (India) president; and Dr. Andrija Stampar (Yugoslavia) and Dr. Lleras Restrepo (Colombia) first and second vice-presidents, respectively, for the first period of office. Sir Ramaswami Mudaliar was unable to be present at the third session of the council and Dr. Stampar acted as president.

The council at its first session established five "nuclear" commissions and one temporary sub-commission, each consisting of nine experts appointed in their personal capacity to explore the fields to be covered by the proposed permanent commissions and to recommend to the council the composition and competence of these commissions.

The "nuclear" commissions were as follows: human rights, with a sub-commission on the status of women; economic and employment; temporary social; temporary transport and communications; statistical. During its first session, the council established one permanent commission, the commission on narcotic drugs, consisting of representatives of 15 governments.

The "nuclear" commissions met at Hunter college in the latter part of April and the first three weeks in May 1946 and submitted their reports to the second session of the council.

During its second session, the council, on the basis of the reports from the "nuclear" commissions determined the terms of reference and composition of the following commissions: economic and employment, transport and communications, statistical, human rights, social. It established a full commission on the status of women, and determined its terms of reference and composition. The council established a temporary sub-commission of the economic and employment commission on the economic reconstruction of devastated areas. It empowered the commission on human rights to set up sub-commissions on freedom of

information and the press, on the protection of minorities and on prevention of discrimination and the statistical commission to establish a sub-commission on statistical sampling. It requested the social commission to take steps to create a sub-commission on child welfare.

During its third session, the council established population and fiscal commissions and determined their terms of reference and composition. It selected the member states to constitute the other permanent commissions, with the exception of the commission on narcotic drugs, which had been constituted at the first session. The council directed the economic and employment commission to set up subcommissions on employment and economic stability and on economic development, and to consider further the question of establishing a subcommission on the balance of payments.

With the exception of the commission on narcotic drugs, which held its first meeting in Nov. 1946, the commissions were scheduled to hold their first meetings in Jan. and Feb. 1947.

The council decided that members of the commissions should consist of members of the United Nations selected by the council with a view to securing a balanced representation in the fields covered by the various commissions. The secretary-general was directed by the council to consult with the governments selected for membership on the commissions before their representatives were finally nominated by those governments. The council held an ad hoc meeting on Dec. 10, 1946, to confirm the normations after the secretary-general had carried out his consultations.

Members of the commissions, it was decided, were to serve for three years and to be eligible for re-election. In the initial period, one-third of the members were to serve for two years, one-third for three years and one-third for four years, the term being determined by lot. Members of the commission on narcotic drugs were, however, all elected for three years.

During its third session, the council decided to recommend to the general assembly that travelling expenses and subsistence allowances should be paid by the United Nations for the members of the commissions and sub-commissions of the council.

The council established standing committees on organization, on negotiations with specialized agencies, and on relations with non-governmental organizations at the first session. It made use of a number of ad hoc committees, in particular the committee on refugees and displaced persons and the committee on the finances of the International Refugee organization.

Economic and Employment Commission.—The following members were elected to this commission by the council at its third session: Belgium, Brazil, France, Poland, United Kingdom for two years; Canada, China, Czechoslovakia, India, Norway for three years, and Australia, Byelorussian S.S.R., Cuba, U.SS.R., United States for four years.

At its second session the council decided that the commission's terms of reference should be: to advise the council on economic questions in order to promote higher standards of living; to make recommendations on economic questions involving concerted study or action by more than one specialized agency or commission of the council. In particular it was to advise on the prevention of wide fluctuations in economic activity and the promotion of full employment.

At the third session, the Economic and Social council

directed the economic and employment commission to establish a sub-commission on employment and economic stability to study national and international full employment policies and fluctuations in economic activity, analyze the causes of these fluctuations and advise the commission on appropriate methods of promoting full employment and economic stability

Reconstruction of Devastated Areas —At its second ses sion the council itself established a temporary sub commis sion of the economic and employment commission on the economic reconstruction of devastated areas, consisting of Australia, Belgium, Canada, China, Czechoslovakia, Ethiopia, France, Greeçe, India, Netherlands, New Zealand Norway, Peru, Philippines, Poland, Ukrainian SSR USSR, United Kingdom, United States and Yugoslavia The sub commission was to advise on the nature and scope of the economic reconstruction problems in those coun tries where they were acute because of occupation or physical devastation, and on the progress of reconstruction and how it might be helped by international co operation

The sub commission was authorized to make inquiries with the consent of the governments concerned in the countries which had been occupied or devastated, except Germany and Japan, and to make a preliminary report on their reconstruction problems, bearing in mind the special claims of countries who were members of the United Nations. The sub commission was to consider the economic relations of those countries with Germany and Japan and with neutral countries

The sub commission met in London on July 29 It con sisted of two working groups, one for Europe and Africa, and one for Asia and the far east. It was decided to confine the work of the second group to preliminary discus sion on how later inquiries might be conducted, and to concentrate on writing the preliminary report on Europe Accordingly, a detailed analysis was made of the material submitted by governments, intergovernmental agencies and the United Nations secretariat, and on the spot in quiries to supplement this information were made in Bel gium Czechoslovakia, France, Greece, Luxembourg the Netherlands, Poland and Yugoslavia The sub commission presented its report to the council at its third session the USSR and Ukrainian delegates reserving their position It also referred to the council a proposal for the establish ment of an economic commission for Europe

The council at its third session also endorsed a recommendation made by the UNRRA council that the general assembly should designate some agency or agencies to review the needs in 1947 for financing urgent imports of the basic essentials of life, particularly food and supplies for agricultural production, after the termination of the UNRRA program, and to recommend what additional financial assistance was necessary

Assistance to the Food and Agriculture Organization — At its second session the Economic and Social council requested the secretary general to offer all possible assistance to the Food and Agriculture organization in making a survey of the world food position and in preparing proposals concerning longer term international machinery with reference to food

The secretary general reported to the council's third session on the discussions which had taken place, and referred to the establishment by the Food and Agriculture organization of a preparatory commission to consider the proposals made for the establishment of a world food board Representatives of the council were invited to participate

in the work of this commission, and the council appointed the chairman of the economic and employment commission to take part in its discussions. The secretary general was requested to report on these discussions to each session of the council until the preparatory commission completed its work.

Transport and Communications Commission.—The council at its third session elected as members of this commission Brazil, India, Netherlands, Poland, United King dom to serve for two years, Chile, China, France, Norway, Union of South Africa to serve for three years, and Czecho slovakia, Egypt, USSR, Yugoslavia to serve for four years

At its second session the council decided that the commission's terms of reference should be to assist the council in its tasks concerned with transport and communications problems to advise on the coordination of the work of specialized agencies in these spheres to advise the council in fields where no permanent international organization yet existed and on problems concerning more than one sphere of transport to suggest to the council the creation of new agencies, or the conclusion of new conventions or the revision of existing conventions, to perform the task of conciliation when so authorized, in cases of dispute between states or specialized agencies on international transport and communications questions, and to assist the Security council and the trusteeship council, if desired by the Economic and Social council

The council considered what inter governmental organizations should operate in five fields of transport and communications aviation, telecommunications, postal, inland transport and shipping and which of the agencies operating in these fields should be brought into relationship with the United Nations

In the case of aviation, it directed that negotiations should be entered into with the Provisional International Civil Aviation organization. It recommended that a world conference be held to review the organization of the exist ing International Telecommunications union and its radio regulations, and directed the secretary general to convene meetings of experts to draft proposals for bringing the International Telecommunications union and the Universal Postal union into relationship with the United Nations

Postal experts of 39 member states met at Lake Success from Dec 10–18, 1946 and drew up a draft agreement for submission to the congress of the Universal Postal union to be held in Paris in May 1947

It was decided that the transport and communications commission should give further study to the question of international organizations in the inland transport and shipping fields

The council at its second session agreed that a commission of experts should prepare the ground for a world conference on passport and frontier formalities, and at its third session requested the secretary general to convene such a meeting and to take into account in preparing its agenda the discussions and recommendations of various international organizations

At the same session the council asked the transport and communications commission to examine the situation and the machinery needed to co-ordinate activities in aviation, shipping and telecommunications with respect to safety at sea and in the air

The council drew to the attention of interested governments the problems of the re establishment and reorganization of intergovernmental and other international machinery for the coordination of rail problems in Europe, and need for improvement of European inland waterways

At its third session the council adopted a resolution recommending that a conference of representatives of interested states meet not later than Nov. 1, 1946, to resolve the problems of the resumption of international traffic on the Danube and establish provisional operating and navigation regulations. (The rules of procedure of the general assembly required that before such a conference could be held members of the United Nations should be consulted.)

The continuation of the activities of the League of Nations organization for communications and transit were entrusted in some instances to the relevant specialized inter-governmental organizations and in others to organs of the United Nations.

Fiscal Commission.—This commission was established at the third session of the council, with the following membership: Belgium, Czechoslovakia, India, New Zealand, United States for two years; Colombia, Cuba, Lebanon, Poland, U.S.S.R. for three years; and China, France, Union of South Africa, Ukrainian S.S.R., and United Kingdom for four years.

The council decided that the commission's functions should be to advise the council in the field of public finance; to advise the council and other commissions on the fiscal implications of recommendations made by the commissions in their own fields, and in general to cooperate with other commissions of the council, organs of the United Nations and specialized agencies.

Statistical Commission.—The council at its third session elected as members of this commission: China, Netherlands, U.S.S.R., United States for two years; Canada, India, Mexico, Ukrainian S.S.R. for three years; and France, Norway, Turkey and the United Kingdom for four years.

It decided that the commission's purposes should be to assist the council in promoting the development of national statistics and the improvement of their comparability, in the co-ordination of the statistical work of specialized agencies and the development of the central statistical services of the secretariat; to assist the council in advising the organs of the United Nations on general questions relating to the collection, interpretation and dissemination of statistical information in promoting the improvement of statistics and statistical methods. It was also to make recommendations on methods of relating the activities of quasi-governmental and non-governmental statistical organizations to those of the United Nations.

The council also decided that a central statistical unit should be organized within the secretariat of the United Nations, and that the secretariat should maintain the statistical work of the League of Nations.

Population Commission.—This commission was established at the third session of the council, with the following membership: China, U.S.S.R., United Kingdom, United States for two years; Australia, Canada, France, Ukrainian S.S.R. for three years; and Brazil, Netherlands, Peru and Yugoslavia for four years.

- The council decided that the commission was to advise it on population changes, the factors associated with such changes and the policies designed to influence these factors, inter-relationships of economic and social conditions and population trends; migratory movements of populations and factors associated with such movements; and any other population problems on which organs of the United Nations or specialized agencies might seek advice.

Social Commission.—The following were elected as members of this commission at the council's third session: Czechoslovakia, France, Greece, Union of South Africa, U.S.S.R., United States for two years; Colombia. Nether-

lands, New Zealand, Peru, United Kingdom, Yugoslavia for three years, and Canada, China, Denmark, Ecuador, Iraq and Poland for four years.

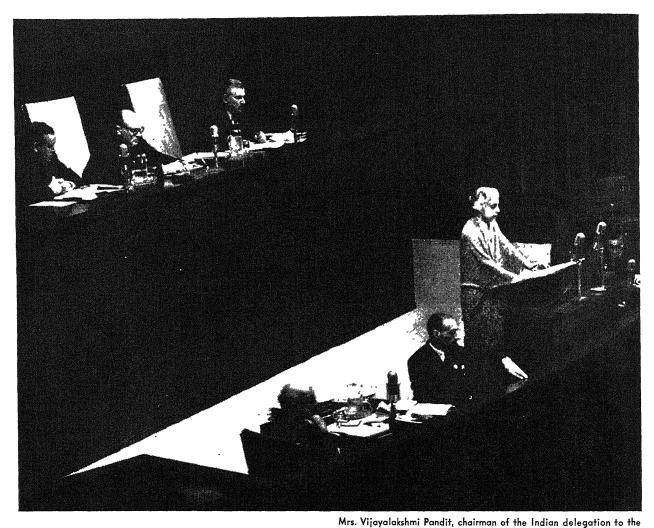

The council decided that the terms of reference of the commission should be to advise the council on social questions of a general character, and in particular on all matters in the social field not covered by specialized agencies; and also on practical measures needed in the social field, and on measures needed for co-ordinating activities in this field. It was also to advise the council on such international agreements and conventions on any of these matters as might be required and on their execution, and to report on how far recommendations of the United Nations on social policy were being carried out.

The commission was instructed by the council at its second session to consider the best way of carrying on the functions of the League of Nations relating to traffic in women and children and measures designed to prevent such traffic. It was also instructed to consider how work in the field of child welfare could effectively be carried out, in co-operation with the international organizations concerned with particular aspects of these problems, and to create a sub-commission for work in the child welfare field. It was also to consider and make recommendations on how effective machinery could be developed for studying on a wide international basis the means for the prevention of crime and the treatment of offenders. The commission was requested to give special attention to problems in countries directly affected by World War II and in countries which were underdeveloped, and in particular to give special attention to the urgent need for finding some way of dealing with the important aspects of the work of the United Nations Relief and Rehabilitation administration after it was brought to a close. It was also asked to consider the desirability of setting up international machinery in the fields of housing and town and country planning.

The Economic and Social council at its third session took note of a resolution passed by the U.N.R.R.A. council in Aug. 1946. The resolution emphasized the desirability of the social welfare functions of U.N.R.R.A. being transferred to the United Nations. These functions would include work connected with the training of social welfare personnel, the rehabilitation of the physically handicapped, the restoration of social welfare activities and institutions, the co-ordination of the activities of voluntary agencies and child welfare.

The Economic and Social council requested the secretary-general to consult immediately with the director-general of U.N.R.R.A., to undertake the necessary studies and investigations, and to submit recommendations to the general assembly on matters requiring its authorization or special financial provisions. In the light of these studies and investigations and of the general assembly's decisions he was to take such further action as seemed desirable and to report to the next session of the council.

A further resolution passed by the U.N.R.R.A. council recommended the creation of an International Children's fund for the rehabilitation of the children and adolescents of countries which were victims of aggression, and set up a standing committee to prepare the necessary recommendations in agreement with the United Nations. The Economic and Social council recommended that the general assembly should arrange for the creation of such a fund, subject to the council's control. The secretary-general was to prepare in consultation with the director-general of

United Nations general assembly, addressing the opening session at Flushing, N.Y., on Oct. 23, 1946

U.N.R.R.A., the president of the Economic and Social council and the U.N.R.R.A. standing committee a draft resolution for submission to the general assembly providing for the establishment of the necessary machinery.

Commission on Human Rights.—The following were elected members of this commission at the council's third session: Byelorussian S.S.R., China, Lebanon, Panamá, United Kingdom, Uruguay for two years; Egypt, France, India, Iran, Ukrainian S.S.R., U.S.S.R. for three years; and Australia, Belgium, Chile, Philippines, United States, Yugoslavia for four years.

At its second session the council decided that the terms of reference of the commission should be to submit proposals, recommendations and reports on: an international bill of rights; international declarations or conventions on civil liberties, the status of women, freedom of information, and similar matters; protection of minorities; prevention of discrimination on grounds of race, sex, language or religion; and any other matters concerning human rights.

The council requested the secretary-general to arrange for the compilation and publication of a yearbook on law and usage relating to human rights; and the collection and publication of information on the activities concerning human rights of all United Nations organs.

At its second session the council empowered the commission to establish a sub-commission on freedom of information and of the press; on protection of minorities; and on the prevention of discrimination on the grounds of race, sex, language or religion.

Commission on the Status of Women.—The Economic and Social council at its third session elected the following as members of this commission: Australia, Byelorussian S.S.R., China, Guatemala, India for two years; Mexico, Syria, U.S.S.R., United Kingdom and United States for three years; and Costa Rica, Denmark, France, Turkey and Venezuela for four years.

The council decided at its second session to establish a full commission on the status of women, which was to prepare recommendations and reports to the council on promoting women's rights in political, economic, social and educational fields.

It was also to make recommendations to the council on urgent problems requiring immediate attention in the field of women's rights.

The "nuclear" sub-commission on the status of women had made recommendations for a policy and program of work to be undertaken by the sub-commission when fully constituted. It considered that in practice priority had to be given to political rights since little progress could be made without them, but recommended that the problems of obtaining improvements in civil, educational, social and economic fields should be attacked simultaneously. The program of work outlined by the "nuclear" sub-commission would provide *inter alia* for a survey of laws pertaining to the status of women and the practical application of

such legislation, polls to sound public opinion, the calling of a United Nations women's conference, the international exchange of all categories of manual and intellectual women workers and the creation of a world-wide opinion through the various information media.

Commission on Narcotic Drugs.—Canada, China, Egypt, France, India, Iran, Mexico, Netherlands, Peru, Poland, Turkey, U.S.S.R., United Kingdom, United States and Yugoslavia were elected as members of this commission for a three-year term by the council at its first session.

The council at its first session decided that the commission's functions should be: to assist the council in exercising such powers of supervision over the application of international conventions and agreements dealing with narcotic drugs as might be assumed by or conferred on the council; to carry out such functions entrusted to the League of Nations advisory committee on traffic in opium and other dangerous drugs by the international conventions on narcotic drugs as the council might find necessary to assume; to advise the council on all matters pertaining to the control of narcotic drugs and draft such international conventions as might be necessary; and to consider and make proposals on any changes that might be required in existing machinery for the international control of narcotic drugs.

The commission held its first session at Lake Success from Nov. 27 to Dec. 13, 1946. The following officers were elected: Col. C. H. L. Sharman (Canada), president; Dr. Stanislaw Tubiaz (Poland), vice-president, and Dr. Szeming Sze (China), rapporteur. As well as considering organizational questions, the commission reviewed the control of narcotic drugs since 1940. A special review was made of the limitation of the production of raw materials, opium smoking in the far east, illicit traffic and drug addiction, with the general purpose of establishing at its prewar level the international control of narcotic drugs. Resolutions were adopted proposing the insertion of provisions for the control of narcotics in the peace treaties with Japan and Germany.

The council at its first session empowered the secretary-general, acting in accordance with the resolution of the general assembly, to take the steps necessary to continue provisionally the work of the opium section of the League of Nations and the secretariats of the Permanent Central Opium board and the supervisory body. Accordingly, arrangements were made for the narcotics division of the United Nations secretariat to assume the work of the opium section of the League as from Aug. 1, 1946, and the competent services of the League secretariat were instructed by the secretary-general of the League to give the narcotics division any assistance it might need.

Arrangements were also made for the fusion of the secretariats of the Permanent Central Opium board and the supervisory body, and for the provisional administrative and financial arrangements required to continue the work of these two organizations.

The assembly had referred to the Economic and Social council the taking of the necessary measures to ensure the continued exercise of the powers and functions of the league under international agreements including those on the international control of narcotic drugs.

The council considered the question at its third session and submitted a draft resolution and draft protocol to the general assembly, recommending that the assembly approve the assumption of the league's functions in this field. The council expressed the view that the Franco government should not become a party to the protocol. It invited the present members of the Permanent Central

board and the supervisory body to continue in office for the time being and requested the general assembly to make the necessary financial provisions to enable these organizations to carry on their functions. (The protocol amending the international conventions and agreements on narcotic drugs was approved by the general assembly. During the first session of the commission on narcotic drugs it was signed by the representatives of 49 member nations.)

Relations with Specialized Agencies.—The council during its first session appointed a committee on negotiations with specialized agencies, consisting of representatives of 11 members. The committee was to enter into negotiations with the Food and Agriculture organization of the United Nations, the International Labour organization, the International Monetary fund, the International Bank for Reconstruction and Development and the United Nations Educational, Scientific and Cultural organization, and to submit a report, including a draft preliminary agreement, for consideration at the council's second session.

The committee met with the negotiating delegates of the International Labour organization on May 28 and 29, 1946, the United Nations Educational, Scientific and Cultural organization on June 3 and the Food and Agriculture organization on June 6 and 7. The draft agreements were submitted to the Economic and Social council at its second session; the council recommended that the general assembly approve them.

At its third session the council approved a draft agreement negotiated with the delegation of the Provisional International Civil Aviation organization, and recommended its approval by the assembly.

The main provisions of the agreements, which were based on principles contained in the Report of the Preparatory Commission, covered such items as reciprocal representation, admission of states not members of the United Nations; proposal of agenda items; recommendations of the United Nations made with a view to coordinating the work of specialized agencies, exchange of information and documents; assistance to the Security council, the Trusteeship council and co-operation with regard to non-self-governing territories; authorization to the agency to request advisory opinions from the international court of justice; headquarters and regional offices, personnel arrangements; statistical services; budgetary and financial arrangements and liaison.

At the request of the International Bank for Reconstruction and Development and the International Monetary fund, the council at its second session decided to postpone negotiations with these organizations but instructed the secretary-general to continue exploratory discussions.

Refugees and Displaced Persons.—Following the general assembly's recommendation referring the question of refugees to the Economic and Social council for examination, and setting forth certain principles for consideration, the council established a special committee on refugees and displaced persons. This committee met in London from April 8 to June 1. It decided that it was necessary to establish an international body of a nonpermanent character to deal with the problem of refugees and displaced persons. The report of the committee was presented to the council's second session. It dealt with the definition of the categories of persons entitled to international protection and assistance; the numbers and location of refugees and displaced persons, conditions governing speedy repatriation, the possibilities of resettling non-repatriables, and the general problems in the far east; the form and

constitution of the new international body and its relationship to the United Nations; examination of various statements and memoranda submitted by private organizations.

In discussing the committee's report at its second session, the council concentrated on the suggestions for a draft constitution for a new international body, to be called the International Refugee organization, and on the definition of persons coming within the mandate of the new organization. It recommended to the general assembly that such an organization should be created on a non-permanent basis, as a specialized agency in relationship with the United Nations.

The secretary-general's report as well as the report of the committee on finances of the International Refugee organization, which met in London from July 6–20, and the comments from governments on the draft constitution, were considered at the council's third session. The secretary-general was requested to plan in consultation with U.N.R.R.A. and the intergovernmental committee on refugees the initiation of the work of the International Refugee organization (I.R.O.).

The draft constitution, with some further revisions, and the arrangements for a preparatory commission were transmitted by the council to the general assembly for its approval. The council also transmitted to the general assembly for final decision the report of the committee on finances of the I.R.O., which had prepared administrative and operational budgets for the first financial year and suggested scales of contributions to each, and the report of the *ad hoc* committee on finance, which revised the estimates by reducing the operational budget for large-scale resettlement from \$60,000,000 to \$5,000,000 and for other operational expenses from \$193,954,000 to \$151,000.

Certain differences of opinion characterized the council's discussions on refugees and displaced persons. These chiefly revolved around the question of how far the problem could be solved by repatriation, and, on the other hand, whether there would remain a large number of genuine non-repatriables which should become the concern of the International Refugee organization, leaving out of account quislings and war criminals.

International Health Conference.—At its first session, the council established a preparatory technical committee, consisting of experts appointed in their personal capacity to prepare documentation for an International Health conference which was to consider proposals for establishing an international health organization. The committee met in Paris in March and drew up a draft constitution which was submitted to the International Health conference, convened by the Economic and Social council. The conference met in New York from June 19 to July 22 and was attended by representatives of all the members of the United Nations and of certain other states, and by observers from international organizations. It adopted the final act of the conference, which incorporated a resolution regarding the activities of the League of Nations health organization; the constitution of the World Health organization, which was signed by 61 states, 2 without reservation as to acceptance; an agreement establishing an interim commission of the organization, which was signed by 61 states; and a protocol concerning the Office International d'Hygiène publique, which was signed by 60 states.

The council requested the general assembly to recommend to all members the earliest possible acceptance of

the constitution of the World Health organization; to transfer to this organization those functions and activities of the League of Nations health organization which the United Nations had assumed; to recommend that members accept the protocol concerning the Office International d'Hygiène publique; to approve the necessary funds for the interim commission and for the health organization during 1947; and to authorize the secretary-general to transmit to the general assembly recommendations to those who sent representatives or observers to the conference.

Preparatory Committee of the International Trade Conference.—The Economic and Social council at its first session decided to call an International Conference on Trade and Employment and established a preparatory committee consisting of the representatives of 19 members to prepare an agenda including a draft convention for the consideration of the conference. The council suggested that the agenda should include international agreements relating to the achievement and maintenance of high and stable levels of employment and economic activity; regulations, restrictions and discriminations affecting international trade; restrictive business practices, and inter-governmental commodity arrangements; and also the establishment of an international trade organization as a specialized agency of the United Nations.

The preparatory committee met in London from Oct. 15 to Nov. 26, 1946, and set up a committee to meet in New York on Jan. 20, 1947, to prepare a drast convention on the basis of the report and other documents of the first session of the preparatory committee.

Non-Governmental Organizations.—To implement the general assembly's resolution recommending that the Economic and Social council should adopt arrangements for consultation with non-governmental organizations, the council appointed a committee consisting of the president and 11 members to draw up proposals for consultation in particular with those organizations mentioned in the general assembly's resolution.

The council, at its second session, adopted the report of this committee. The report outlined certain principles governing arrangements for consultation. The organization should be concerned with matters falling within the competence of the Economic and Social council, its aims should be in conformity with the United Nations charter, and it should represent a substantial proportion of the organized persons within its particular field and have authority to speak for its members through its authorized representative. National organizations were eligible for consultation if they covered a field not covered by any international organization or had special experience.

Non-governmental organizations would not be given the same rights of participation accorded to states not members of the council or to specialized agencies. The objects of consultation would be to secure expert information or advice and to enable organizations representing important elements of public opinion to express their views.

At its second session the council set up a new committee with a smaller membership, being composed of the president and representatives of China, France, the U.S.S.R., the United Kingdom and the United States, and instructed the committee to review and make recommendations on applications for consultative status. At the third session the council decided that the committee, in addition to reviewing and making recommendations on applications, should be a standing committee to carry on consultations with organizations given consultative status. The committee on Oct. 2 held consultations with the

Transfer of Non-Political Functions of the League.— The Economic and Social council at its first session requested the secretary-general to undertake a survey of the non-political functions of the League of Nations other than those exercised under international agreements, and to take the necessary steps to assume and continue the work of the league departments, as recommended in the resolution of the general assembly.

In a memorandum dated Sept. 26, 1946, the secretary-general appraised the council of the action taken in compliance with these resolutions. The memorandum surveyed the league committees, commissions, departments and publications relating to economic and social questions, and referred to the action taken to assume and continue provisionally the work of the league in these fields. It also referred to the action taken as regards league activities by various commissions of the United Nations. The report of the secretary-general was placed on the agenda of the general assembly.

The council, at its third session, recommended that the preparatory commission of the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.) and the International Institute of Intellectual Co-operation be requested to undertake negotiations for the future transfer to U.N.E.S.C.O. of the functions and activities of the institute.

Trusteeship Council.—Trusteeship agreements submitted by Australia, Belgium, France, New Zealand and the United Kingdom were approved by the general assembly at the second part of its first session, and these states automatically became members of the Trusteeship council.

China, the U.S.S.R. and the United States were members of the Trusteeship council, by virtue of their position as permanent members of the Security council. To make the number of states on the council not administering trust territories equal that of the administering powers, the general assembly elected Iraq and Mexico for a three-year term.

The Trusteeship council was scheduled to hold its first meeting on March 26, 1947. The agenda for the first session of the council included the adoption of rules of procedure; the election of president and vice-president; the formulation of questionnaires on the political, economic, social and educational advancement of the inhabitants of each trust territory, in accordance with article 88 of the charter; the consideration of such petitions concerning trust territories as might have been presented; and the consideration of the relations between the Trusteeship council on the one hand and the Economic and Social council and the specialized agencies on the other.

The General Assembly—Second Part of the First Session.—The second part of the first session of the general assembly was convened on Oct. 23 and adjourned on Dec. 16, 1946. During that period, the assembly held 35 plenary meetings and 357 committee and sub-committee meetings. It admitted four new members to the United Nations: Afghanistan, Iceland, Sweden and Siam.

As non-permanent members of the Security council, the general assembly elected Belgium, Colombia and Syria to replace Egypt, Mexico and the Netherlands, retiring members. It elected new members to replace the retiring members of the Economic and Social council—Colombia, Greece, Lebanon, the Ukrainian S.S.R., the United States and Yugoslavia. The Byelorussian S.S.R., Lebanon, New Zealand, the United States and Venezuela were elected in the first instance, and Turkey and the Netherlands tied for the sixth place. Thereupon Belgium offered to resign if

both Turkey and the Netherlands were elected. Turkey was elected to the sixth vacant position, and the Netherlands was elected to fill the vacancy caused by the resignation of Belgium.

The assembly had approved trusteeship agreements submitted by Australia, Belgium, France, New Zealand and the United Kingdom.

The general assembly received reports from the Security council, the Economic and Social council and the secretary-general. It decided that the terms of office of members of councils should begin on Jan. 1 following their election and end on Dec. 31 following the election of their successors.

The third Tuesday in September was fixed as the date for convening the regular annual session of the general assembly.

Political and Security Matters.—The general assembly adopted unanimously a resolution recognizing the necessity of an early general regulation and reduction of armaments and armed forces. The assembly's unanimity was the result of a compromise between the U.S.S.R., which considered as the primary objective in the general reduction of armaments the prohibition of the production and use of atomic energy for military purposes, and the United States, which insisted that emphasis must be placed on the creation of effective safeguards by way of inspection and other means to protect complying states against violations and evasions, before any general system for the regulation of armaments could be planned effectively.

The resolution recommended that the Security council should give prompt consideration to formulating the practical measures, according to their priority, essential for two specific purposes: first, to provide for the general regulation and reduction of armaments and armed forces, and, second, to assure that such regulation and reduction would be generally observed by all participants, and not unilaterally by only some of the participants.

The resolution urged the fulfilment by the Atomic Energy commission of its objectives, and recommended that the Security council expedite consideration of the commission's reports, and also that it should expedite consideration of a draft convention or conventions for the creation of an international system of control and inspection. This convention should include the prohibition of atomic and all other major weapons adaptable to mass destruction, and provisions for the control of atomic energy to the extent necessary to ensure its use only for peaceful purposes.

An international system of control and inspection was to be established within the framework of the Security council.

It was to operate through special organs which were to derive their powers and status from the international conventions under which they were established.

The general assembly recommended that the Security council accelerate as much as possible the placing at its disposal of the armed forces mentioned in article 43 of the charter. It recommended that members undertake the progressive and balanced withdrawal, taking account of the needs of occupation, of their armed forces stationed in former axis territories and the withdrawal without delay of armed forces stationed in the territories of members. It further recommended a corresponding reduction of national armed forces and a general progressive and balanced reduction of national armed forces.

Finally the assembly stated that nothing in the resolu-

tion was to alter or limit the general assembly's resolution establishing the Atomic Energy commission.

A further resolution adopted by the assembly on information on the armed forces of the United Nations called on the Security council to determine, as soon as possible, the information which the states members of the United Nations should be called upon to furnish, in order to give effect to the resolution on the general regulation and reduction of armaments.

The general assembly, while admitting Afghanistan, Iceland, Sweden and Siam to membership in the United Nations, recommended that the Security council re-examine the applications for membership of Albania, Ireland, Mongolia, Portugal and Trans-Jordan on their respective merits in accordance with the provisions of article 4 of the charter. It also requested the Security council to appoint a committee to confer with a committee on procedures of the general assembly with a view to preparing rules acceptable both to the assembly and the council governing the admission of new members. The assembly committee appointed on Dec. 15 was composed of representatives of Australia, Cuba, India, Norway and the U.S.S.R.

The general assembly recommended that the Franco government of Spain be debarred from membership in international agencies established by or brought into relationship with the United Nations and that all members of the United Nations immediately recall from Madrid their ambassadors and ministers plenipotentiary accredited there.

After considering the application of India regarding the treatment of Indians in South Africa, the general assembly expressed the opinion that such treatment should be in conformity with the international obligations under the agreements between the two countries and requested the two governments to report at the next session of the assembly the measures adopted to this effect.

Economic and Social Matters.—Recognizing that the food situation was still unsatisfactory, the general assembly urged governments and international agencies to adopt or continue measures to alleviate world food shortages in 1947 and to facilitate the equitable allocation and prompt distribution of available food supplies.

The assembly approved the resolution of the Economic and Social council on economic reconstruction of devastated areas, and directed the secretary-general to inform the International Bank for Reconstruction and Development (q.v.) that the assembly considered that the bank should come into effective operation as soon as possible. It recommended that the Economic and Social council consider undertaking a general survey of raw material resources needed for the economic reconstruction of devastated areas, and that it give prompt and favourable consideration to the establishment of an economic commission for Europe and an economic commission for Asia and the far east.

The general assembly, recognizing the need for relief after the termination of U.N.R.R.A., established a special technical committee of ten experts to study the minimum import requirements of the basic essentials of life in countries requiring assistance and to report on the financial assistance required.

The general assembly created an International Children's Emergency fund, to be utilized for the benefit of children and adolescents of countries which were the victims of aggression, or which were receiving assistance from

U.N.R.R.A., and for child health purposes generally. The fund was to consist of any assets made available by U.N.R.R.A. or any voluntary contributions from governments, voluntary agencies, individuals or other sources. The fund was to report to the Economic and Social council

By a majority vote the general assembly approved the constitution of the International Refugee organization and an interim arrangement for a preparatory commission, and urged members to sign both instruments. The assembly authorized the secretary-general to make the necessary staff available to the preparatory commission. It urged members to consider favourably receiving on their territory for permanent settlement their fair share of non-repatriable persons. The assembly approved for the first financial year of the organization an administrative budget of \$4,800,000, and an operational budget of \$151,060,500 for other than large-scale resettlement and \$5,000,000 for large-scale resettlement expenses.

The assembly also recommended that members accept the constitution of the World Health organization at the earliest possible date, and instructed the secretary-general to take the necessary steps to effect the transfer to the interim commission of the organization those functions of the League of Nations health organization assumed by the United Nations. The assembly approved a loan by the United Nations of a maximum sum of \$300,000 to finance the activities of the interim commission from its inception to the end of the financial year 1946, and approved a further loan of \$1,000,000 for 1947 either to the commission, or, if established, to the World Health organization itself.

The agreements entered into by the Economic and Social council with the International Labour organization, the United Nations Educational, Scientific and Cultural organization, the Food and Agriculture organization of the United Nations and the International Civil Aviation organization were approved by the general assembly, provided that in the case of the International Civil Aviation

"Replanting World Trade." Bishop in the St. Louis Star-Times signified his approval of the Bretton Woods arrangements, which congress accepted in a bill approved on July 20, 1945

organization it complied with the assembly's resolution barring the Franco regime from membership in agencies affiliated with the United Nations.

The general assembly recommended that the Economic and Social council give to the World Federation of Trade Unions the right to submit to the council questions for inclusion on its agenda.

In order to continue and develop the international control of narcotic drugs, the general assembly approved a protocol amending the agreements, conventions and protocols on narcotic drugs concluded at The Hague on Jan. 23, 1912, at Geneva on Feb. 11, 1925, and Feb. 19, 1925, and July 13, 1931, at Bangkok on Nov. 27, 1931, and at Geneva on June 26, 1936.

Trusteeship and Information from Non-Self-Governing Territories.—The general assembly approved individually the following eight trusteeship agreements: (1) for New Guinea submitted by Australia, (2) for Ruanda-Urundi submitted by Belgium, (3) for the Camerouns under French mandate submitted by France, (4) for Togoland under French mandate submitted by France, (5) for Western Samoa submitted by New Zealand, (6) for Tanganyika submitted by the United Kingdom, (7) for the Cameroons under British mandate submitted by the United Kingdom and (8) for Togoland under British mandate submitted by the United Kingdom.

Australia, Belgium, France, New Zealand and the United Kingdom, by virtue of their position as administering authorities, and China, the U.S.S.R. and the United States, as permanent members of the Security council, became *ipso facto* members of the Trusteeship council. To make the representatives on the council of states not administering trust territories equal to the number of administering powers, in accordance with the terms of the charter, the assembly elected Iraq and Mexico for the three-year term of office. It directed the secretary-general to convoke the first session of the Trusteeship council not later than March 15, 1947.

The Union of South Africa, in accordance with its undertaking to the assembly in January, reported to the general assembly the outcome of its negotiations with the people of South-West Africa. The outcome of these negotiations, it was stated, was that a majority of the inhabitants desired the incorporation of the territory in the Union of South Africa. The general assembly, however, decided that it was unable to accede to this incorporation and recommended that the mandated territory of South-West Africa be placed under the International Trusteeship system, inviting South Africa to submit a trusteeship agreement of the territory.

The general assembly noted that information had been transmitted by certain governments under chapter XI of the charter concerning conditions in non-self-governing territories and other governments had declared their intention of submitting such information. It invited members transmitting information to send to the secretary-general by June 30 of each year the latest information at their disposal, recommended that this should be summarized, analyzed and classified by the secretary-general and included in his report to the assembly's next session, and that the information should be transmitted to the specialized agencies. The assembly also established an ad hoc committee composed in equal numbers of members submitting information and members elected to the assembly, to examine the secretary-general's summary and analysis and recommend procedures to be followed in the future. Representatives of the specialized agencies were to sit on the committee in an advisory capacity.

The general assembly recommended that members responsible for the administration of non-self-governing territories should convene conferences of representatives of non-self-governing peoples so that expression might be given to the views and aspirations of the peoples.

Administrative and Budgetary Matters.—The general assembly approved the granting of privileges and immunities to all members of the staff of the United Nations, excepting those recruited locally and assigned to hourly rates of pay; recommended that all members grant full immunity from national taxation to their nationals employed in the secretariat; established a provisional staff retirement and insurance scheme for the secretariat; and adopted provisions relating to children's allowances and education.

The assembly appropriated an amount of \$19,390,000 (U.S.) for 1946 and an amount of \$27,740,000 for 1947 to finance the activities of the United Nations. It adopted a working capital fund of \$20,000,000 for 1947, and approved a scale of assessments for the 1946 and 1947 budgets and the working capital fund.

The secretary-general was requested to append to the United Nations budget for 1948 the budgets of the specialized agencies and to explore arrangements by which the budgets of the agencies might be presented to the assembly for approval.

Legal Matters.—The general assembly approved the agreement between the United Nations and the Carnegie foundation concerning the use by the international court of justice of premises in the Peace palace at The Hague. It approved the agreements between the court and the Netherlands government concerning privileges and immunities and recommended that members of the court, the registrar and officials, agents and counsel of parties, assessors, witnesses and experts should be accorded such privileges and immunities as were necessary for the exercise of their duties.

The general assembly, on recommendation of the Security council, resolved that Switzerland might become a party to the statute of the international court of justice by depositing with the secretary-general of the United Nations an instrument containing (a) acceptance of the statute, (b) acceptance of the obligations of the charter under article 94, and (c) an undertaking to contribute to the expenses of the court.

After considering the application of articles 11 and 12 of the statute of the court, the assembly resolved, subject to the concurrence of the Security council, that "any meeting of the General Assembly held in pursuance of the Statute of the International Court of Justice for the purpose of the election of the members of the Court shall continue until as many candidates as are required for all the seats to be filled have obtained in one or more ballots an absolute majority of votes."

The assembly authorized the Economic and Social council to request advisory opinions of the court on legal questions arising within the scope of the council's activities. The assembly affirmed the principles of international law recognized by the charter of the Nuernberg tribunal and the judgment of the tribunal, and directed the committee on the codification of international law to treat these principles as of primary importance in the formulation of a general codification of offenses against the peace and security of mankind. The assembly affirmed that genocide is a crime under international law for which those guilty are punishable. It invited members to enact the necessary

legislation, and recommended international co-operation to facilitate its prevention and punishment. It requested the Economic and Social council to draw up a draft convention on the crime of genocide for submission to the assembly.

The general assembly adopted detailed regulations for the registration and publication of treaties and international agreements. It also adopted an official seal and emblem of the United Nations and recommended that members should prohibit the use of the emblem, name and initials of the United Nations without the authorization of the secretary-general.

Assets and Functions of the League of Nations.—The general assembly approved the agreement and protocol transferring League of Nations assets to the United Nations. It requested the secretary-general to assume the non-political functions and activities of the League secretariat, and the Economic and Social council to assume those of the League committees and commissions, excepting in both cases those functions exercised in pursuance of international agreements and those entrusted to specialized agencies. The assembly authorized the United Nations Educational, Scientific and Cultural organization to utilize the assets of the Institute of Intellectual Co-operation transferred by the League of Nations to the United Nations.

Headquarters of the United Nations.—The general assembly accepted the offer of John D. Rockefeller, Jr. to give the United Nations \$8,500,000 to acquire land in New York city in the area bounded by First Avenue, East 48th street, the East river and East 42nd street. It was a condition of this offer that certain adjacent parcels of land which were not available to Mr. Rockefeller were to be given to the United Nations by the city of New York.

The assembly authorized the secretary-general to negotiate with the appropriate authorities of the United States an agreement concerning the arrangements required as a result of the establishment of the permanent headquarters in New York.

Specialized Agencies

During World War II, steps were being taken, not only to found a general international organization to maintain peace and security, but also to establish specialized organizations to deal with specific postwar problems.

A United Nations Conference on Food and Agriculture held at Hot Springs, Va., from May 18 to June 3, 1943, set up an Interim Commission on Food and Agriculture to draw up a constitution for the Food and Agriculture organization of the United Nations.

The conference of allied ministers of education, which first met in London in the fall of 1942, considered plans for a permanent education organization.

The first United Nations agency to be fully created, however, was the United Nations Relief and Rehabilitation administration (q.v.). The agreement establishing it was signed Nov. 9, 1943, and the following day the first meeting of the U.N.R.R.A. council took place.

Articles of agreement for an International Monetary fund and an International Bank for Reconstruction and Development (qq.v.) were drawn up by the United Nations Monetary and Financial conference held at Bretton Woods, N.H., during July 1–22, 1944.

From Nov. 1 to Dec. 7 of the same year, the International Civil Aviation conference met in Chicago and drafted a convention on international civil aviation and an interim agreement providing for the coming into force

of a Provisional International Civil Aviation organization.

Account was taken at Dumbarton Oaks and again at San Francisco of the possible contributions of these international agencies to the general over-all world organization. Article 39 of the charter provided that various intergovernmental agencies having wide international responsibilities in their specific fields should be brought into relationship with the United Nations. Accordingly, the Economic and Social council instructed a committee to negotiate agreements with certain of these agencies.

Agreements with three agencies were signed and approved by the general assembly and the organizations themselves. These were the Food and Agriculture organization of the United Nations, the International Labour organization (q.v.) and the United Nations Educational, Scientific and Cultural organization. An agreement with a fourth agency, the International Civil Aviation organization, was negotiated on its behalf by the Provisional International Civil Aviation organization until the permanent organization, which was to function until the permanent organization came into being. The general assembly approved this agreement subject to the compliance of the International Civil Aviation organization with any decision of the general assembly regarding Franco Spain.

Negotiations were authorized with the International Monetary fund, the International Bank for Reconstruction and Development, the Universal Postal union and the International Telecommunications union. In addition, those organizations which were being formed through the machinery of the United Nations—the World Health organization, the International Refugee organization and the International Trade organization—were also to be brought into relationship with the United Nations.

Food and Agriculture Organization.—The Food and Agriculture organization (F.A.O.) of the United Nations officially came into being on Oct. 16, 1945, with the signing of its constitution at the first session of the conference. The United Nations Interim Commission on Food and Agriculture, set up in July 1943, had prepared the constitution for the permanent organization and had sent it for approval to the various countries which had been present at the Hot Springs conference.

The Food and Agriculture organization at the beginning of 1947 had a membership of 47 nations. Additional members might be admitted by a concurring vote of a two-thirds majority of the members of the conference and upon their acceptance of the constitution.

The constitution provided that the organization was to collect, analyze, interpret and disseminate information relating to food and agriculture. It was to promote and make recommendations on scientific, technological and economic research and to improve education and administration in these fields. It also was to promote the conservation of natural resources and the adoption of improved methods of agricultural production, as well as the improvement of processing, marketing and distribution, the provision of adequate agricultural credit and international policies concerning agricultural commodity arrangements.

The organs of the Food and Agriculture organization were specified as a conference, an executive committee and a staff headed by a director-general. The conference, composed of one representative from each member nation, was made the policy-making body of F.A.O.; it was to meet at least once each year. Each nation was given one vote in the conference. The executive committee of 9 to 15 members was to act for the conference between sessions.

The first session of the conference took place from Oct.

16 to Nov. 1, 1945. At this conference, rules of procedure and financial regulations were established; the budget for the first and second financial years and the bases for the first year's activities were worked out. The conference appointed the executive committee and the first directorgeneral, Sir John Boyd Orr.

The conference divided into six committees covering nutrition and food management, agriculture, forestry and forest products, fisheries, marketing and statistics. Numerous recommendations were made in each of these fields, out of which emerged two dominant lines of thought: (1) expansion of production and consumption, the one to be adjusted to the other in various specific ways—through international commodity arrangements and expanded trade, raising the nutrition level of vulnerable and low-consumption groups, reorientation of production and new uses of commodities, and (2) recognition of the principle that agriculture and industry are interdependent and that, therefore, agricultural and industrial development must go hand in hand in the less developed countries.

The second session of the conference met in Copenhagen during Sept. 2–13, 1946. It approved the Appraisal of the World Food Situation, 1946–47; endorsed the recommendations of the special meeting on urgent food problems for the maximum use of the year's food supplies and noted the need for continued allocation measures; endorsed the report of the special F.A.O. mission for Greece on the development of agriculture and fisheries in that country; and adopted the reports of the technical committee on the various programs of work for the coming year.

The conference established a preparatory commission on world food proposals to develop and organize production, distribution and utilization of the basic foods and to stabilize agricultural prices at levels fair to producers and consumers alike. The commission, which met Oct. 28, 1946, to Jan. 24, 1947, made a number of recommendations regarding industrialization and economic development in relation to purchasing power for food; stabilization of prices and expansion of trade by specified types of international commodity arrangements; and development of programs to increase production and provide better distribution of the world's food.

The budget of the Food and Agriculture organization, as approved by the first session of the conference for the period from Oct. 16, 1945, to June 30, 1946, was \$1,954,696. The second session approved a budget of \$6,782,000 for the period from July 1, 1946, to Dec. 31, 1947.

United Nations Educational, Scientific and Cultural Organization.—A conference to consider the establishment of an educational and cultural organization was called by the United Kingdom government, in association with the French government, for Nov. 1, 1945. Previously, the conference of allied ministers of education in London, in association with a United States educational delegation, had drawn up and circulated to governments a draft constitution for a permanent educational organization. The French government at San Francisco had proposed a United Nations Educational and Cultural organization and also submitted a draft constitution to the conference.

The conference met in London during Nov. 1–16, 1945, and on the basis of these proposals drew up the constitution of U.N.E.S.C.O. At the same time, the conference established a preparatory commission of the United Nations Educational, Scientific and Cultural organization and decided that the seat of the new organization would be in Paris.

The purpose of the organization, as set out in its con-

stitution, was to contribute to peace and security by promoting collaboration among the nations through education, science and culture in order to further universal respect for justice, for the rule of law and for the human rights and fundamental freedoms.

U.N.E.S.C.O. established a general conference and an executive board. The general conference, meeting annually, was to determine the policies and main plans of work of the organization and summon international conferences. The executive board, consisting of 18 members elected for 3-year terms by the general conference, was made responsible for the execution of U.N.E.S.C.O.'s program. It was to meet in regular session at least twice a year. The director-general was to be appointed by the general conference, on nomination of the executive board, for a period of six years.

The preparatory commission was charged with making arrangements for the first session of the general conference, preparing recommendations on the program and budget of the organization, and providing for immediate action on urgent needs of educational, scientific and cultural reconstruction in devastated countries. The seat of the organization was transferred from London to Paris in Sept. 1946.

The constitution of the United Nations Educational, Scientific and Cultural organization came into force on Nov. 4, 1946, when 20 governments had accepted its terms. The constitution provided that member states of the United Nations might become members of U.N.E.S.C.O.; other states might become members of the organization, subject to its agreement with the United Nations, by a two-thirds majority vote of the general conference. Thirty countries were members of U.N.E.S.C.O. at the beginning of 1947.

In accordance with the plans made by the preparatory commission, the first session of the general conference met in Paris from Nov. 19 to Dec. 10, 1946. It elected the director-general of the organization, Julian Huxley, and developed a comprehensive program of work for 1947. The conference adopted reports of the commissions on educational reconstruction and rehabilitation, on program, legal and external relations, and administration and finance. A budget of \$6,000,000 was approved for 1947 and a revolving fund of \$3,000,000 was authorized.

Provisional International Civil Aviation Organization.-The International Civil Aviation conference, held at Chicago from Nov. 7 to Dec. 1, 1944, drew up a convention on international civil aviation providing for the establishment of a permanent International Civil Aviation organization and an interim agreement on international civil aviation providing for the establishment of a Provisional Civil Aviation organization to operate until the permanent organization came into being, but in any case not longer than two years. Two additional agreements were adopted by the conference: the International Air Services Transit agreement providing for the mutual exchange of the first two freedoms of the air, the right to fly across foreign territory and the right to land for non-commercial purposes; the International Air Transport agreement providing for the mutual exchange of the five freedoms of the air-the two mentioned above, and in addition the rights to disembark and to take up in a foreign country traffic from the state of origin of the aircraft, and the right to carry traffic between two foreign countries. Various technical annexes were also adopted at the conference.

The provisional organization came into being on June

16, 1945, in accordance with the terms of the interim agreement, when it had been ratified by 26 countries.

The governing bodies of the Provisional International Civil Aviation organization (P.I.C.A.O.) were the interim assembly, composed of delegates from each member state and the interim council, composed of not more than 21 member states elected by the assembly for 2-year terms. The assembly, meeting annually, was to approve the financial arrangements of the organization and deal with all matters not specifically assigned to the council.

The interim council was made the executive body of the organization; it supervised the work of its committees and made recommendations concerning technical matters to member states. The interim council was deemed to function continuously. Its first session convened on Aug. 15, 1945. The interim council established three permanent committees: air navigation committee, air transport committee and committee on international convention.

In addition to these permanent committees, the interim council established administrative and standing council committees.

Considering that some of the problems of international civil aviation are regional in character, the interim council decided to hold a number of regional air navigation meetings. During 1946 meetings were held in the North Atlantic (Ireland), European-Mediterranean (France) and middle eastern (Egypt) regions.

The first session of the interim assembly was held from May 21 to June 7, 1946. It adopted 53 resolutions. In addition to administrative and budgetary matters, the resolutions dealt with such substantive questions as a multilateral agreement on commercial rights in international civil air transport, facilitation of international air transport, problems of international air mail and P.I.C.A.O. recommendations for standards, practices and procedures.

The interim assembly approved a budget of \$1,960,000 to cover the financial year 1946-47.

World Health Organization.—The constitution of the World Health organization was adopted by the International Health conference, convened by the Economic and Social council, which met in New York during June 19–22, 1946. It was to come into force after 26 members of the United Nations had become parties to it "by signature without reservation as to approval; signature subject to approval followed by acceptance; or acceptance." Acceptance was to be effected by the deposit of a formal instrument with the secretary-general of the United Nations.

The organization was to act as the directing and coordinating authority on international health work; to collaborate with other organizations and assist governments in strengthening health services; to provide technical assistance, on request, to governments and provide health services for special groups, such as the people from trust territories. It was to maintain epidemiological, statistical and other services; help eradicate epidemics and diseases; assist in preventing accidental injuries; and promote the improvement of nutrition, housing, sanitation, recreation and other aspects of environmental hygiene.

The constitution provided that the World Health organization was to consist of a world health assembly, an executive board and a secretariat, as well as technical committees. The assembly, to be composed of delegates of all members, was to meet annually and be the policy-making body of the organization. The executive committee was to consist of 18 members elected by the assembly for a term of 3 years.

The interim commission established by the International Health conference consisted of 18 states. It was to convoke the first session of the World Health assembly and to take the necessary steps for the transfer to the World Health organization of the necessary functions and activities of the League of Nations and the Office International d'Hygiène publique.

In response to the application of the interim commission the general assembly approved a loan by the United Nations of \$300,000 to finance the activities of the interim commission from the beginning of its work to the end of the financial year 1946; a further loan of \$1,000,000 was approved to finance the activities of the interim commission of the World Health organization during the year 1947.

The general assembly at the second part of its first session approved the constitution of the International Refugee organization and recommended it to governments for signature. The committee was to come into force when 15 states had become parties to it.

The constitution recognized that genuine refugees and displaced persons should be assisted by international action, but that the main task as regards displaced persons was to encourage and assist them to return to their country of origin.

The functions of the International Refugee organization were to be the repatriation, identification, registration and classification, care and assistance, legal and political protection, transport and resettlement and re-establishment in countries able and willing to receive them, of refugees and displaced persons.

The principal organs of the organization were to be the general council, the policy-making body in which each member was to be represented, and the executive committee, consisting of representatives of nine members. A director-general, nominated by the executive committee and appointed by the general council, was to be responsible for appointing the staff and carrying out the administrative and executive functions of the International Refugee organization.

The general assembly approved a budget for the first financial year in the amount of \$4,800,000 for administrative expenses, \$151,060,500 for operational expenses and \$500,000 for large-scale resettlement expenses.

The establishment of a preparatory commission for the International Refugee organization, to consist of one representative from each government signatory to the constitution, was approved by the general assembly. This agreement was to come into force when signed by eight governments signatory to the constitution.

The director of the intergovernmental committee on refugees, the director-general of U.N.R.R.A. and the directorgeneral of the International Labour organization were to be invited to sit with the preparatory commission in a consultative capacity. The commission was to take the necessary measures for bringing the organization into effective operation and was empowered to take over the functions, activities, assets and personnel of existing organizations dealing with refugees and displaced persons where it considered this essential. The commission was to be convened as soon as possible and would cease to exist upon the election of the director-general of the organization. United Nations Relief and Rehabilitation Administration

The United Nations Relief and Rehabilitation admin istration (UNRRA) was established on Nov 9, 1943 as the first service agency of the United Nations. In 1946 it was composed of 48 member governments, each of which participated in UNRRA s policy making council. Nine governments—the US, the United Kingdom, the soviet union, China, France, Canada, Australia, Brazil and Yugoslavia—were also represented on the Central committee, which was empowered to make emergency policy decisions between sessions of the council Executive responsibility was vested in the director general, assisted by his staff composed of more than 12,000 persons and about 30 different nationalities. Herbert H. Lehman served as director general from the inception of the administration until his

resignation in March 1946. He was succeeded by Fiorello H. La Guardia

UNRRA was organized to provide relief and rehabilitation to the people of liberated territories in Europe and the far east, concentrating primarily on assisting those nations without adequate foreign exchange resources to finance their own relief imports. This assistance consisted of relief supplies—food, clothing fuel, medicines relief services—health and welfare services, repatriation of displaced persons and rehabilitation supplies and services—seeds, fertilizers, insecticides, farm tools repair parts, etc.

To finance these supplies and services, each member country not occupied by the enemy was asked to contribute 1°0 of its national income for the year ending June 30 1943 Later, each was asked to make a second contribution in the same amount. Meanwhile all countries, invaded and uninvaded alike, contributed proportionately to UNRRA's administrative budget. As of July 31, 1946, the total operating and administrative contributions authorized by UNRRA's member governments amounted to \$3 691,866,918. The total amounts subscribed by the three largest contributors were. US \$2 700 000 000. United Lingdom, \$624 650 000 and Canada, \$138 738 739.

After a period of planning and truining UNRRA took over relief operations from the military in Greece on April 1, 1945, and in Yugoslavia on April 15, 1945 VE day paved the way for increasing supplies and shipping to meet the needs of liberated countries in Europe VJ day made possible relief and rehabilitation operations on a global basis.

In 1946, UNRRA was providing general relief aid to the following countries Albania, Austria, the Byelorussian Soviet Socialist Republic, China, Czechoslovakia, the Dodecanese Islands, Greece, Italy Poland, the Ukrain ian Soviet Socialist Republic and Yugoslavia Programs of limited emergency aid were in effect on behalf of Finland, Hungary and the Philippines, and a special program was being operated to help Ethiopia in the fields of medicine, welfare and transport.

In 1946, UNRRA personnel assisted the military in the care of more than 1 000 000 displaced persons, and idministered hundreds of displaced persons assembly centres however overall responsibility for the displaced persons operations in Germany and Austria was lodged in the military authorities who provided the basic supplies and transportation

The acceleration of UNRRA's operation was borne out by the following cumulative statistics of supplies shipped overseas

End of first quarter 1945 37 000 long tons
I nd of second quarter 1945 964 269 long tons
End of third quarter, 1945 2,067 786 long tons
I nd of fourth quarter 1945 3 920 902 long tons
I nd of first quarter 1946 7 787 198 long tons
I nd of second quarter, 1946 12 430,773 long tons
I nd of third quarter 1946 17 107 648 long tons
End of fourth quarter 1946 19 885 870 long tons

Operations in 1946 were seriously affected by the critical world food shortage UNRRA was unable to obtain sufficient allocations of bread grains to meet its minimum overseas commitments during the first half of the year. The fourth session of the UNRRA council, held in March 1946, underscored the necessity for the supplying and receiving countries to take all possible measures to conserve and make available more food to avert widespread famine in Europe and the far east. La Guardia elected director general at this session devoted most of his time in the succeeding months to overcoming the food shortage.

Loaves of bread supplied by U.N.R.R.A. being distributed at Weimar to displaced persons temporarily quartered at Buchenwald during July 1945

He also called attention to the necessity of finding a permanent solution to the displaced persons problem in Europe.

Extraordinary efforts on the part of the major wheat growing countries and the arrival of harvests in liberated areas materially eased the food crisis in the last half of 1946, although U.N.R.R.A. officials warned that the danger of hunger would remain at least through 1947.

The U.N.R.R.A. council held its fifth session at Geneva in Aug. 1946, principally to adopt policies regarding the termination of the organization and the transfer of its remaining functions to permanent international bodies. Among the resolutions adopted were: (1) transfer of U.N.R.R.A.'s major health activities to the World Health organization or its interim commission; (2) authorization of the transfer to the United Nations of such social welfare functions as the United Nations desire to undertake; (3) continuation of displaced persons operations until undertaken by the International Refugee organization or by any other appropriate body, provided that none of these operations was to be continued by U.N.R.R.A. after June 30, 1947; (4) rehabilitation of children and adolescents of liberated countries by the creation of an International Children's fund to which such assets would be transferred as the central committee might determine, to be available after completion of the work of U.N.R.R.A.; and (5) recommendation that the general assembly of the United Nations establish the appropriate agency, or agencies, to review the needs in 1947 for financing urgent imports of the basic essentials of life, after the termination of U.N.R.R.A. programs, and to recommend the financial assistance required to meet such future relief needs. United Service Organizations

U.S.O. was chartered Feb. 4, 1941. Months before, when the plan to mobilize U.S. manpower was taking form, representatives of leading social service agencies met to discuss ways of providing for the recreational and religious welfare of the new armed forces. The idea of joint operation emerged, and the group drew up plans for an agency in which the three major religious faiths would have equal participation and responsibility. That the required agency should be a civilian organization financed by voluntary gifts of the U.S. people also seemed requisite to the founders, in spite of opposition from some quarters.

The six great humanitarian service agencies, representing the major faiths, which combined their resources and experience in the constitution of U.S.O. were the Young Men's Christian associations, the National Catholic Community service, the National Jewish Welfare board, the Young Womens Christian associations, the Salvation army and the National Travelers Aid association. Every step was taken with the support and concurrence of the war department. Later the welfare and recreational activities of U.S.O. and the Red Cross were defined to prevent overlapping of effort. Roughly, U.S.O. services were limited to the U.S. and to noncombat zones in the Atlantic and Pacific areas, such as Hawaii, Panama, Newfoundland, the Caribbean, Alaska, and, in general, South America. The Philippines were added after their liberation in 1945. An exception to the above was U.S.O.-camp shows, the sole agency to take professional talent from the U.S. for entertainment of troops overseas, performing only on military posts, in military hospitals and in the several war theatres.

In June 1941, U.S.O. launched the first of the financial campaigns which resulted in the receipt of more than \$200,000,000 through the war years and in the period following the end of hostilities. For its first two years, 1941 and 1942, U.S.O. conducted its own campaigns. In the succeeding three years, its fund raising efforts were combined with those of a number of other war related agencies in the National War fund. In 1946, U.S.O. engaged in a campaign of its own to finish its wartime tasks and carry through until it received its "honourable discharge" at the end of 1947.

Original plans for U.S.O. called for the establishment of less than 500 clubs to provide a "home away from home" atmosphere for service men. As the war progressed, however, and the largest fighting force in the history of the nation was trained and deployed to the far corners of the earth, it became imperative to revise these plans. Eventually, practically every feature of recreational welfare had its place in the organization's plans and program. At its peak, in March 1944, U.S.O. reached a total of 3,035 operations, and expenditures climbed to \$5,800,000 a month. The organization was serving 1,000,000 a day, and at one time 730,000 volunteers were on its rolls.

In addition to more than 1,500 clubs in the continental U.S., there was a series of U.S.O. lounges for troops in transit, working with U.S.O.-Travelers Aid bureaus in transportation terminals; mobile service—U.S.O. clubs-on-wheels—which carried recreation, supplies and good will to

men and detachments on outpost duty; and overseas service, which had its clubs, smaller centres and mobile units outside the continental U.S. During wartime, in some 200 industrial communities, U.S.O. activities helped maintain the morale of men and women working in great war plants and living in overcrowded boom towns. Not only were there distinct religious programs, but U.S.O. and its member agencies distributed religious literature in almost uncountable quantities and religious articles—more than 20,000,000 annually in the U.S. and overseas—to those who desired them.

U.S.O.-Camp Shows, Inc., had a similar record. More than 5,000 entertainers in more than 700 units toured army camps, navy installations and service hospitals from just prior to Pearl Harbor until long after hostilities ended. In addition, early in 1946, U.S.O.-Camp Shows entertainment was extended at the request of the Veterans' administration to all V.A. hospitals. At the peak of its service in 1945, entertainers were giving 700 shows a day to service personnel; these performances ranged from individual specialty acts to full Broadway shows whose casts were rehearsed and perfected before they set foot on shipboard. Troupers entertained total audiences of more than 200,-000,000 service men and women. Some 200 widely known artists, enrolled in the U.S.O.-Camp Shows Hospital Sketching program, made nearly 250,000 portraits of hospitalized (L. F. K.) service men.

U.S. troops forgot the rain and mud of Luzon for a short while as they laughed at the antics of U.S.O. entertainers during a camp show

United States

The decade 1937–46 was fraught with events of tremendous import for the United States, both in its domestic affairs and in its foreign relations. For a third of the period—from Dec. 1941 to Aug. 1945—the nation was engaged in the most terrible war of human history, with armed forces fighting on world fronts from the Aleutians to the South Pacific islands and from the coasts of France and western Africa to the heart of the German reich. The postwar casualty roll released on June 27, 1946, by the war department listed as killed or missing 308,978 of the 10,000,000 men and women mobilized: a toll far exceeding the combined losses in all of the nation's previous foreign wars.

But aside from the years of actual combat, the whole decade was dominated by war psychology. In fact, the year 1937 may be taken to mark the shift of emphasis in government policy from the domestic to the foreign scene. It was on Oct. 5 of that year that President Franklin D. Roosevelt made his "quarantine" speech in Chicago, calling on the peace-loving nations to check the epidemic of

Pres. Roosevelt's third-term election conceded, neighbours gathered outside his home at Hyde Park, N.Y., to offer congratulations on the night of Nov. 5, 1940

military aggression which was spreading in Europe and Asia. Hitler had moved his troops into the Rhineland the summer before in violation of the treaty of Versailles and the pact of Locarno. In the late spring of 1937, Prince Fumimaro Konoye, a tool of the extreme militarists, became premier of Japan, and the expected attack on China south of the Great Wall followed on July 7 with the clash at the Marco Polo bridge, near Peiping. The Rome-Berlin-Tokyo axis had been formed with the determination to subject all Europe and Asia to the rule of the totalitarian despots. President Roosevelt receded momentarily from his defiant attitude at Chicago; but from 1937 on, his main efforts were directed toward rousing his fellow-countrymen to the danger which would threaten the U.S. in the event of the success of the axis powers, and in furthering a policy of military preparedness, conscription, revision of the hampering neutrality legislation and all-out aid to the Allies short of actual participation in the war.

Little by little, in spite of the determined opposition of noninterventionist groups, public opinion as recorded by public opinion polls came to the support of the President's policies. His smashing victory over Alfred M. Landon in the election of 1936 had been followed in 1940 by his triumph over Wendell Willkie to shatter the tradition observed since George Washington's day of the limitation of the presidential tenure of office to two terms. Four years later, when the nation was in the very thick of the world struggle, he was elected for a fourth term over Gov. Thomas E. Dewey of New York; but less than three months after the inauguration he succumbed to a cerebral haemorrhage at Warm Springs, Ga. (April 12, 1945), and was succeeded by Vice-President Harry S. Truman of Missouri.

Trends in Population.—According to the decennial federal census of 1940 the continental population of the United States was 131,669,275, an increase of 8,894,229 or 7.3% over the 1930 census. In Aug. 1946 the official figures given out by the census bureau showed that the population had passed the 141,000,000 mark. If possessions and dependencies were included—and the Philippine Islands, although granted formal independence on July 4, 1946, were still in effect a dependency of the United States—the total population would reach approximately 160,000,000.

Two trends were noticeable in the population. First, the rate of increase was declining. For several decades it had averaged only about 7%, whereas in the early years of the republic, decennial gains of 20% to 25% were registered. It was this rapid growth that led Thomas Jefferson to predict that by the end of the 19th century the nation would have a population of over 200,000,000. Furthermore, U.S. demographic experts were now of the opinion that the nation was approaching a "saturation point," and that by 1980 the population might be stabilized at something like 170,000,000. The reasons for this lag in increase could not be determined with accuracy; but the closing of the inviting frontier toward the end of the 19th century, the restrictions imposed on immigration in the 20th century and the shift of population to urban centres, in which various social and economic conditions made for smaller families than those raised in the rural districts, might all be contributing causes to the slowup.

The second trend was toward a higher proportion of elderly people in the population. A falling birth rate combined with a longer expectancy of life (made possible by medical advance and government benefits to the aged and infirm) resulted in some rather startling statistics. For example, while the population as a whole increased 7.3% in the decade 1930–40, the number of persons 65 years old

Appraisal of the dispute between U.S. interventionists and non-interventionists prior to Pearl Harbor. The cartoon, by Hungerford of the *Pittsburgh Post-Gazette*, was captioned "A Strange Race Horse"

and over increased 35%; and while at the beginning of the 20th century only 4% of the people were in this old age group, by 1940 the proportion had grown to over 7%; sociologists predicted that by 1980 the proportion would rise to over 9%. In other words, instead of the 10,000,000 aged people of 1946, there would be about 18,000,000 a generation later. The significance of this trend for public and private institutions of social security, hospitals and charities could not be ignored. Moreover, while most of the citizens who were too young to work were also too young to vote, the oldsters had the ballot and might exercise an influence on legislation comparable to a major lobby. (See also Birth Statistics; Census Data, U.S.; Church Membership; Death Statistics; Indians, American; Negroes, American.)

Congress, 1937-46

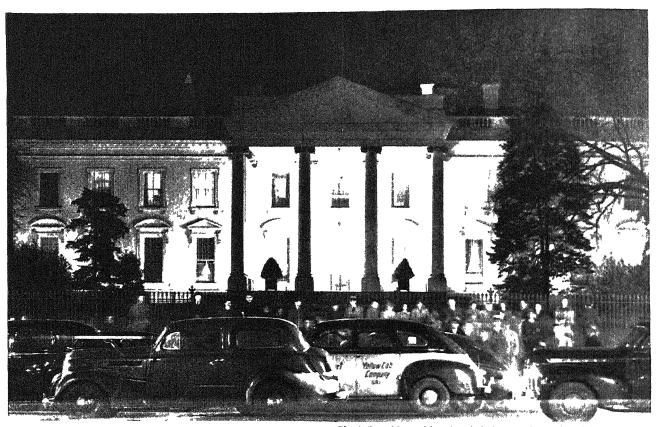

During the entire decade, the control of both houses of congress was in the hands of the Democrats. Their majorities varied from session to session. In the 75th congress (elected in the year of Roosevelt's amazing victory over Landon) the Democrats held 334 of the 435 seats in the house and 76 of the 96 in the senate; and in none of the four succeeding congresses of the decade did they fall behind a majority of 100 in the house, except in the 78th congress (1943–45) when the parties were fairly balanced at 222 Democrats and 209 Republicans. The 79th congress, however, elected in the presidential year of 1944, saw the Democrats recover their wide margin with 243 seats to 190 for the Republicans. In the senate the Democratic strength varied from 70 in the 75th congress (when several of the Democratic senators had to find seats on the Republican

side) to 58 in the 79th congress. These large majorities were not an unmixed blessing for the Democrats, since they gave occasion for frequent dissensions within their own ranks.

"Breathing Spell."-By 1937, the major measures of the New Deal for the relief of the small business men, the farmers, the unemployed, the underpaid, and the aged and infirm had been passed. Though some of these measures, like the Agricultural Adjustment act and the National Industrial Recovery act of 1933, had been held unconstitutional by the supreme court, the New Dealers had found valid substitutes for them in the Soil Conservation act of 1936 and the Wagner National Labor Relations act of 1935. The Social Security act of 1935, which President Roosevelt declared to be the "supreme achievement" of his administration, was designed to remedy the glaring inequalities between great wealth and dire poverty. The Securities act protected the investor in the stock market. The Home Loans act provided government aid for home owners overburdened with mortgages. The Works Progress administration was furnishing jobs for thousands of idle men in the construction of roads, bridges, schoolhouses, hospitals, playgrounds and public buildings. The Tennessee Valley authority and the Civilian Conservation corps (recruited from young men without a job) were making lasting contributions to the preservation of U.S. natural resources.

Although the president had declared in his final address of the 1936 campaign that he had "just begun to fight" for adequate wages, the abolition of farm tenancy, crop insurance, slum clearance, collective bargaining and the proper distribution of the ample products of U.S. industry, he was soon speaking as if the work of the New Deal was virtually accomplished except for a "machining down" of the measures; he was assuring the opposing business interests that they might look forward to a "breathing spell." The tapering off of the president's and of congress's occupation with the program of domestic reform from the year 1937 on was because of a rising concern over the aggressions of the fascist and nazi dictators. Nevertheless, the final session of the 75th congress (Jan. 3-June 16, 1938) saw the passage of two important measures in furtherance of the New Deal program: the elaborate Agricultural Adjustment act of Feb. 14, which Secretary of Agriculture Henry A. Wallace called "the best farm program that the nation has ever had," and the Wagner Fair Labor Standards (or Wages and Hours) act, which President Roosevelt hailed as, "with the exception of the Social Security act, the most far-sighted program for the benefit of workers ever adopted." Large sums were appropriated by congress for work relief, slum clearance, low cost housing, farm loans, and various benefit payments. In a "fireside chat" of June 24, 1938, the president lauded the 75th congress as having "achieved more for the future good of the country than any congress between the end of the [first World] war and 1933." (See New Deal.)

Futile Neutrality.—The next year (1939), the storm broke in Europe with Hitler's invasion of Poland and the prompt declaration of war on Germany by Great Britain and France. Recalling the futile efforts of President Woodrow Wilson to keep the United States out of World War I, and remembering that in former European wars (1812, 1914) when England's defense of the Atlantic lines of trade had been threatened, the United States had been eventually involved, the government and people became immediately concerned with the problem of U.S. neutrality. As early as

The White House blazed with lights on the night of Dec. 8, 1941, as the chief executive conferred with national leaders following the U.S. declaration of war on Japan

Aug. 1935 congress had passed a temporary act forbidding the export of arms and ammunition to European belligerents and closing U.S. ports to belligerent warships. And in Jan. 1937 the embargo provisions were extended to cover the Civil War in Spain—a serious handicap for the illarmed loyalist forces when Hitler and Mussolini were pouring in weapons and battalions to reinforce Franco's fascist armies.

Since the temporary neutrality law was to expire on May 1, 1937, it was necessary for congress to provide a new act by that date. The will to preserve U.S. neutrality was unanimous: the only question was as to the means best calculated to achieve that end. Some members of congress favoured a strict mandatory law, tying the president's hands; others would adhere to the traditional policy of leaving the president and the state department free to conduct foreign relations through the channels of diplomacy; still others advised a compromise which would give the president a certain amount of discretion in carrying out a program within the general provisions prescribed by congress. This third counsel prevailed in the new act passed on May 1, 1937, and reluctantly signed by President Roosevelt, who felt that it would unduly hamper his negotiations with foreign powers and prove more likely to get the nation into war than to keep it out. The act provided: (1) that when the president should proclaim that a state of war existed between any nations of the old world, no arms should be exported or loans made to the belligerents; (2) that the president might forbid U.S. citizens to travel on ships of nations at war; (3) that he might forbid U.S. ships to carry goods purchased in the United States by belligerents and compel the latter to pay cash for such goods before shipment (the "cash and carry" plan); (4) that armed merchantmen and war vessels of the belligerents be denied entrance to U.S. ports; and (5) that the president

might extend the embargo provisions to certain other materials than arms. Note the extent of the discretionary power left to the president by the italicized words of the above clauses.

Convinced that this power was madequate, President Roosevelt persisted in his efforts to persuade congress to repeal the embargo provisions of the act, his appeal of July 1939 being rejected by a vote of 12 to 11 in the senate committee on foreign relations. When the European war broke out in September, however, he called congress in extra session on the 21st of the month, for the express purpose of securing the repeal. His personal pleas to Hitler and Mussolini to refrain from aggressions which would plunge Europe into war had been met with cynical silence or insulting advice to mind his own business; and he had become convinced that the combined action of the peaceloving states was the only hope for the defeat of the dictators. The United States had to "play a part" in this concerted effort. Its hands had to be free to furnish all aid short of war to the democracies in their struggle for existence. Roosevelt would still maintain such safeguards of neutrality as the closing of danger zones to U.S. vessels and the cash and carry provision of the act of 1937; but the embargo on arms and ammunition would no longer be allowed to prevent Great Britain and its allies from buying the materials of war in the United States. The change which had taken place in public opinion in the two years following the act of 1937 was reflected by the unexpectedly large majorities by which the repeal of the embargo was voted by the senate (Oct. 27) and the house (Nov. 2).

When the fury of Hitler's blitz was launched on Norway, the Netherlands, Belgium and France in the spring of 1940, and his bombers began to rain destruction on the English cities, there came an increasing sense of the danger to U.S. security. It was an infamous pact with Stalin in Aug. 1939 that had given Hitler, the professed saviour of Europe from bolshevism, a free hand to crush Poland and launch his attack on western Europe. The fall of France on June 22, 1940, extended his empire to the Pyrenees and left Great Britain to battle alone, under the inspiration of the indomitable Winston Churchill, for the survival of liberty and democracy. If England should share the fate of France, the whole burden of resistance to world tyranny would fall on the shoulders of the U.S., which was woefully unprepared for such an emergency.

The regular army and national guard comprised less than 750,000 men. Secretary of the Navy Charles Edison was calling for the construction of 100 warships at an estimated cost of \$1,300,000,000. The nation was building fewer than 1,000 planes a month, and of the 5,000 on hand in May 1940 Chief of Staff George Marshall declared that only 1,500 were fit for use. Congress responded readily to the president's recommendations for increased war matéiel, authorizing appropriations of more than \$13,000,000,000 for national defense. But the proposal to resort to conscription to augment the armed forces met with bitter opposition in congress and in the country.

On June 20, 1940, Sen. Edward Burke of Nebraska introduced a conscription bill, based on the Selective Service act of 1917, and declaring that adequate forces could not be raised by voluntary enlistments. After a spirited debate of three months the Selective Training and Service bill of 1940 was passed by votes of 47 to 25 in the senate and 232 to 124 in the house and was signed by the president on Sept. 16. It was the first time in U.S. history that peacetime conscription had been adopted. The act provided that "every male citizen and alien between the ages of 21 and 36 residing in the United States," with certain specified exceptions, should be obliged to register for military service. Those to be inducted into the service were to be drawn by lot, in the same way that the lottery had been conducted in 1917. In fact, the same "goldfish bowl" that held the capsules containing the fateful inducting numbers in 1917 was used in the drawing of Oct. 29, 1940. On that day, 19,670 men were called into the service as the first contingent of the 900,000 which might be raised in any one year in time of peace.

Nonshooting War.—The next year (1941) saw the adoption by congress of another piece of legislation of prime importance: the Lend-Lease act of March 11, 1941. Less than two weeks after the meeting of the first session of the 77th congress, which was to last through the entire year, a bill was introduced into the house "to promote the defense of the United States." It marked a drastic departure from the policy of neutrality. Hitherto the Allies had been permitted to purchase supplies for cash and to carry them in their own vessels, but U.S. ports were closed to their warships, and U.S. vessels were forbidden to enter the danger zones. The new bill proposed to put the enormous industrial resources of the United States at the disposal of the Allies, thus making the nation a virtual partner of the nations fighting the axis powers.

The terms "lend" and "lease" in the title of the bill were somewhat misleading as to the nature of the aid rendered, for the ordinary conditions of a loan were absent from it. There was no limit placed upon the amount of money or material to be furnished; no specification of the terms of payment; no time set for the expiration of the act; no restriction made on the geographical destination of the supplies. The United States, in Presi-

dent Roosevelt's words, was to become "the arsenal of democracy." For two months a bitter battle was waged in congress over the bill, and amendments without number were proposed. Hours were consumed by opponents who declared that the nation was heading straight for war and was preparing to part with the materials needed for its own defense. The entire country was aroused. Organizations like "America First" and "No Foreign Wars" were combated by groups with the names of "Fight for Freedom" and "Defense of America by Aid to the Allies." The Gallup poll showed a majority of 70% in favour of lendlease. The bill passed by a vote of 60 to 31 in the senate and 317 to 17 in the house and was immediately signed by the president. On March 27, congress appropriated \$7,000,000,000 for lend-lease, and on Oct. 28 supplemented it by a further appropriation of \$5,985,000,000. The British were jubilant over the act, and Winston Churchill called it "Hitler's death warrant."

That the country was "heading for war," however, seemed evident from the orders of the president and the measures of congress which marked the months of 1941. On April 10, U.S. troops occupied the Danish island of Greenland to protect Atlantic shipping. On May 7, congress ordered the seizure of 92 German and Italian ships in U.S. ports. On June 14, assets of the axis countries in the United States were frozen, and two days later their consulates in the U.S. were closed. On July 7, U.S. troops occupied Iceland. During August and September, German submarines sank several U.S. merchant ships, and the president gave orders (Sept. 11) to "shoot on sight" at these marauders. Then, in October, the submarines began to attack U.S. war vessels, missing the destroyer "Greer" off Iceland, but hitting the "Kearny" on Oct. 17 and killing 11 men, and two weeks later sinking the destroyer "Reuben James" with the loss of more than half her crew.

In Nov. 1941, congress, by the close vote of 212 to 194 in the house, repealed the last remnants of the neutrality law and extended the service time of the drafted men to two and a half years. The following figures told the story of the spurt in preparedness. On June 30, 1940, the army numbered less than 300,000 men; a year later, 1,462,347. On June 30, 1940, the tonnage of combat ships was 823,335; in Oct. 1941 it was 2,138,590. During World War I, the United States spent \$22,000,000,000; by May 1941 congress had appropriated \$52,000,000,000—and the United States was still at peace!

"Date of Infamy."—It was not the depredations of the German submarines, however, that brought the nation into the war, but the treacherous raid of the Japanese planes on the base at Pearl Harbor on Dec. 7, at the very moment when the Japanese envoys at Washington, D.C., were deceiving Secretary Cordell Hull with conciliatory words. The next day congress, with but a single dissenting vote, declared war against Japan, and three days later both houses by unanimous votes declared war on Germany and Italy. The following June, war was declared on the axis Balkan satellites, Hungary, Rumania and Bulgaria.

During the war years congress was occupied almost entirely with legislation to implement the president's recommendations for the successful prosecution of the war. It promptly created the federal agencies which he called for to control prices and mediate between management and labour. It extended lend-lease until no fewer than 33 countries were benefiting by the act. It raised the number of registrants under the Selective Service act to a total of 42,000,000 men, by including those between the ages of 36

and 65, and created the women's auxiliary corps for the army (WACS), the navy (WAVES) and the coast guard (SPARS). Congress had made but little progress on the program recommended by President Roosevelt in his message of Jan. 6, 1945, when the surrender of Japan in August brought the war to a close. President Truman called the legislators back to Washington, D.C., on Sept. 5 and presented them with a long message containing 21 proposed measures, to which he added 5 more in his annual message of Jan. 21, 1946. Congress had readily endorsed foreign commitments, ratifying the San Francisco charter and the Bretton Woods agreement, extending the reciprocal trade pacts, and providing liberally for U.N.R.R.A. But it did "distressing little," in the president's words, to implement his overloaded program for domestic reform and recovery. Southern Democrats, resisting the trend toward New Deal policies in the program, joined with the Republicans in sabotaging four-fifths of the proposals. Week after week was spent in hearings before investigating committees, the Pearl Harbor case alone running to 16,000,000 words of testimony. And the approaching midterm congressional elections combined with the distressing labour situation made the legislators chary of risking any measures which might injure their chances of returning to Washington. So the vast and slow business of reconversion, redeployment, readjustment of wages, revision of taxes, restraint of inflationary prices and a hundred other remedial measures to help the country on the way to the realization of an era of prosperity awaited the assembling of the 80th congress in Jan. 1947, a congress in which the Republicans had a majority in both branches. (See also Elections; Law.)

The Executive

For 12 years and 39 days before his death on April 12, 1945, Franklin D. Roosevelt occupied the presidential chair. During these years he made 15 replacements in his cabinet, the most sensational being the appointment of two prominent Republicans in the midsummer of 1940: Henry L. Stimson, Herbert Hoover's former secretary of state, to be secretary of war, and Col. Frank Knox, Republican vice-presidential candidate in 1936, to be secretary of the navy. Soon after assuming office, President Truman began to recast the cabinet, and by the autumn of 1946 no Roosevelt appointee was left in it, the last to go being Wallace, secretary of commerce, who was dismissed by President Truman on Sept. 20, 1946, for making a speech in New York in which he criticized the administration's policy toward soviet Russia. He was replaced by W. Averell Harriman, then ambassador to London and former ambassador to soviet Russia.

President Roosevelt belonged to what his distant cousin Theodore had called the Lincoln-Jackson type of executive, in contrast to the Taft-Buchanan type: that is, a president not content merely to "execute" the mandates of congress, but taking the initiative himself, as spokesman for the U.S. people, in proposing and urging legislation for the general welfare of the country. In pursuance of his domestic policies, President Roosevelt, especially in the earliest years of his administration, often met with determined opposition by conservatives in congress and on the supreme court. For the framers of the constitution, remembering the arbitrary conduct of many of the royal governors in colonial days, had taken pains to limit the power of the executive at home by the famous system of "checks and balances."

At the same time, the crying need for a central authority to speak for the United States as a truly united nation had led the founding fathers to give the president very large powers in the field of foreign relations. He was to appoint all ministers, consuls and special envoys to foreign states. subject in most cases to the consent of the senate (which was rarely refused). He likewise was to name all the high officials in the army and navy, and as commander-in-chief of the armed forces of the country he could order them to any region that he chose. He had the sole initiative in diplomatic negotiations, and though a vote of congress was necessary for the declaration of war, he could, and often did, so shape his diplomatic policy that the actual declaration by congress was hardly more than an inevitable ratification of his acts. It was only logical, then, that when the aggressions of Germany, Italy and Japan in central Europe, Spain and China brought a shift in the primary interests of the administration from the domestic problems of the New Deal to the need for protection against the designs of the axis powers, the attention of congress and the public should be turned chiefly to the international situation. Not that the president abandoned his program of the New Deal. At the opening of the year 1937 he declared, in the language of John Paul Jones, "I have just begun to fight!" And a year later he told congress that his domestic reform measures were not to be "put away in a filing cabinet." Nevertheless, his own prime concern during the ensuing years was to supply the maximum of material aid to democracies at war until the nation was com pelled by Japan's sneak attack at Pearl Harbor to abandon its futile efforts to remain neutral in the midst of an embattled world.

President Roosevelt was a breaker of precedents. In the summer of 1932 he flew to Chicago to accept his first nomination in a speech before the Democratic convention; and

"The Crash," an interpretation of one of the factors in the swing toward Republicanism in the congressional elections of 1946.

Cartoon by Summers of the Buffalo Evening News

shortly after his inauguration he began a series of "fireside chats" or intimate talks to the U.S. people broadcast from his desk in the White House. In his capacity as chief of his party as well as head of the nation, he intervened by speeches and letters in the mid-term campaign of 1938 to compass the defeat of certain southern senators, like Millard E. Tydings of Maryland, Walter F. George of Georgia and Ellison Smith of South Carolina, who had been hostile to his policies, since the summer before he had proposed a drastic change in the composition of the supreme court. He was the first of United States presidents to run for a third consecutive term (1940), though twice in former years congress had passed resolutions condemning such a course as fraught with danger to the republican form of government. Before the United States entered the war he took the responsibility, without consulting congress, of transferring to Great Britain 50 overage destroyers in exchange for the lease of eight naval bases along the Atlantic coast from Newfoundland to British Guiana. And during the war he made distant trips to Morocco, Cairo, Tehran (Iran) and Yalta to confer in person with Churchill, Chiang Kai-shek and Stalin on the conduct of the war and the territorial and political arrangements which should follow. Shortly after his fourth mauguration in Jan. 1945 President Roosevelt died. There had been no thought of supplanting him in the Democratic convention of 1944, when the war was at its peak-the first time since 1864 that a presidential election was held with the country actually at war. The president's own preference was to have Vice-President Wallace again as his running mate, but Wallace was not acceptable to the conservative wing of the party, and Sen. Truman of Missouri was substituted for him.

Truman's elevation to the presidency, leaving the country for the seventh time in its history without a vicepresident, revived the question (still unsettled) of the presidential succession. Congress had passed a law in 1792 providing that in case of vacancy in the offices of both president and vice-president, the presiding officer of the senate and after him the speaker of the house should succeed to the presidency. But since either of these men might be in opposition to the policy of the administration (as would have been the case had President Andrew Johnson's impeachment in 1868 been sustained by the senate), the law was changed in 1886, providing for the succession of the cabinet officers in the order of the creation of their departments. But, since the president appointed the cabinet members, this law enabled him to name his successor in case of his own death or resignation. Various suggestions were made for remedying the situation: that the senate should choose the new president; that he should be elected by a joint ballot of the two houses of congress; that the office should go to the man who had received the next highest vote to that of the successful candidate in the nominating convention; or that the convention be reconvened to name a president. Fortunately, the nation had never been confronted with a vacancy in both the presidency and the vice-presidency.

National Finance

The Budget and Accounting act of 1921 had set up a bureau of the budget and required the president to submit to congress at the time of his regular annual message in January a special budget message with estimates of the government's expenditures and receipts for the fiscal year beginning the following July 1. During the prosperous decade of the 1920s, the increase in the national income from some \$50,000,000,000 in 1922 to \$81,128,000,000 in

Harry S. Truman being sworn in as thirty-second president of the U.S. at 7:09 p.m., April 12, 1945. The oath was administered by Chief Justice Harlan F. Stone in the presence of members of the cabinet, a few hours after the death of Pres. Roosevelt

1929, and the rise in treasury receipts from \$356,000,000 to over \$600,000,000, resulted in surpluses which made possible not only a substantial reduction of the national debt of \$22,000,000,000 incurred in World War I, but also a considerable abatement of income taxes.

But the great depression of the early 1930s brought distress to the treasury. The national income fell in 1932 to less than half its peak figure of three years before, and there began a series of deficits totalling \$27,000,000,000 in the years from 1933 to 1939, an amount larger than the national debt at the end of World War I. President Roosevelt in these years deliberately resorted to the policy of "deficit financing"; that is, of pouring out large sums of government money for the relief of unemployment, the stimulation of the people's buying power, subsidies to the farmers, benefits to the aged and infirm, pensions for retired railroad men, public works on roads, dams, buildings and parks, aid to mortgaged-oppressed home owners, and many other projects designed to start the stalled wheels of production, raise wages and bring the national income back to the \$80,000,000,000 level. State and local governments and private charities were unable to cope with the depression. The national government was the only agency competent to do so. Thus the balancing of the budget was deemed a minor consideration as compared with the rescue of the American people from their distress and their fear of the future.

The annual budget deficits of \$3,000,000,000 or \$4,000,000,000, however, incurred by the financing of the various

measures of the New Deal (some of which were self-liquidating), were as a drop in the bucket when compared with the mounting deficits of the decade 1937-46. The expenses of preparedness for war, then of actual participation in war during the decade, were colossal. While the nation was still at peace, the national debt increased from \$36,-427,000,000 in 1937 to \$57,938,000,000 at the end of 1941, and the deficit for the latter year was nearly \$11,000,-000,000. After Pearl Harbor the daily rate of the war expenses rose to \$150,000,000 (or \$1.15 for every man, woman and child in the country), while taxes were bringing in only \$49,000,000 a day to the treasury. In 1944 the war was taking 45% of the national income of \$116,000,-000,000, whereas in the peak year of World War I the expenses were but 9.5% of the income of \$56,700,000,000. And by 1945 the national debt had risen to \$2,116 per capita. The total cost of the government (including its five major wars) from 1789 to 1940 was \$154,000,000,000; the cost of World War II from Dec. 8, 1941, to Aug. 14, 1945, according to the research staff of the American university at Washington, D.C., was \$317,600,000,000.1 The 13 budgets of President Roosevelt totalled \$461,000,000,ooo, or nearly four times the amount of the combined budgets of his 30 predecessors!

During this hectic decade, the statutory debt limit was steadily raised in the attempt to keep pace with the mounting national debt. In 1937 the limit was \$45,000,000,000, and the debt \$36,427,000,000. In Feb. 1941 the limit was raised to \$65,000,000,000, and by the end of the year the debt of \$57,938,000,000 was again close to the limit. Then, after the limit had been raised to \$240,000,000,000 in 1944 and the debt had passed the \$250,000,000,000 figure in 1945, congress gave up the Canute's attempt to stem the rising tide. On June 30, 1946, the debt, according to the figures of the treasury, was \$275,000,000,000,000, an increase of more than 600% in a decade.

It had been President Wilson's policy in World War I to provide for one-third of the expenditures by taxation and two-thirds by loans. That ratio was almost exactly maintained; the treasury collected \$11,280,000,000 in taxes, while the four Liberty Loans from May 1917 to Oct. 1918, together with the postwar Victory Loan of April 1919, brought in approximately \$23,000,000,000. But, even with the great increase in the national wealth since President Wilson's day, the Roosevelt administration could not hope to make taxation pay anything like one-third of the staggering cost of World War II. It was not until the outbreak of war in Europe in 1939 and the consequent beginning of serious activity for the defense of the country that a policy of taxation was entered, one which grew more drastic each succeeding year.

In the revenue acts of 1940 congress, with the usual reluctance to increase taxes in a presidential election year, proceeded rather gingerly. It lowered the exemptions on individual incomes to add about 2,000,000 taxpayers to the list, imposed a 10% special defense tax to expire at the end of 1944, and moderately increased the surtaxes on the brackets from \$600 to \$100,000. In Sept. 1941, though Secretary Henry Morgenthau, Jr., had asked for a 331/3% increase, the Revenue act made little change in the rates. But three months later the United States entered the war, and taxes began to soar. The act of Oct. 1942, designed to

add \$9,000,000,000 to the revenue, raised the normal income tax from 4% to 6%, imposed a special victory tax on all incomes above \$624, and lifted the surtax from 6% to 13% on incomes of \$2,000, and from 77% on incomes of \$500,000 to 82% on incomes of \$200,000. Whereas in 1940 there were only 7,437,307 taxable returns, it was estimated that 27,000,000 persons would pay on 1942 incomes and that 43,000,000 would pay the victory tax. A single man with an income of \$2,000, who paid a tax of \$20 in 1917, would now have to pay \$287.50.

President Roosevelt urged that no one be allowed to have an income of more than \$25,000 after taxes were paid. In his budget message of Jan. 1943 he asked for \$16,000,000,000 in new taxes; but after this amount was cut to \$10,500,000,000 by Secretary Morgenthau, congress in the autumn of 1943 granted hardly a fifth of the treasury's demand. Again an election year was approaching. President Roosevelt, breaking a precedent of 50 years, vetoed the revenue bill, calling it a bill for the relief of the "greedy." But congress immediately passed the bill over the veto. The revenue collected in the fiscal year ending June 30, 1945, was \$46,500,000,000 as against \$5,400,000,000 in 1940, and 37% of the people were paying income taxes in 1945 as compared with 11% in 1940.

With the end of the war in sight, the President's budget message of 1945 was the first since 1938 to call for a reduced revenue. And when the war ended in August the U.S. taxpayer hoped for a substantial relief. The Revenue act of Nov. 8, 1945, did, to be sure, remove some 12,000,ooo persons in the lowest brackets from the list of taxpayers, and slightly reduced surtaxes, at the expense of some \$5,000,000,000 to the treasury. But for two good reasons congress was unwilling to scale taxes down precipitously. First, because of continuing obligations and fixed charges, such as the interest on the enormous national debt, and second, because it regarded high taxes as the most efficient way of closing the "inflationary gap" created by the savings of \$125,000,000,000 in the hands of the American people bidding for the scarce supplies of consumers' goods.

Besides taxation, the government resorted to loans for its revenue-for in neither of the World Wars did it adopt the expedient, so embarrassing in the American Revolution and the Civil War, of issuing unsupported paper currency; nor did it have to seek loans from foreign countries. Between Dec. 1942 and Dec. 1945 it floated eight enormous war loans, calling for a total of \$106,000,000,000. The American people responded by subscriptions of \$156,-900,000,000, or nearly 150% of the quotas. Two out of every three persons in the United States subscribed to the popular Series E bonds, first issued in the Third War Loan of Sept. 1943. Whereas in World War I the average rate of interest on the war bonds had been 4.25%, the treasury financed World War II at the astonishingly low interest rate of 1.8%-a testimony both to the abounding wealth of the country and to the confidence of its citizens in their government. Labour Relations

The decade 1937-46 was the most fertile in U.S. history in the development of labour relations. Realizing that the word "labour" in its general sense is synonymous with human effort exerted in any manner and that the men who toil on farms or experiment in scientific laboratories or teach in colleges or create forms of art or volumes of lit-

¹ Figures on the cost of the war varied. The secretary of the treasury reported the cost as of V-E dav (May 8, 1945) as \$275,900,000,000, while the *Umted States News* of Washington, D C, set the cost from June 30, 1941, to Dec. 1946 at \$341,491,000,000 The lower figure of the treasury report was due to the fact that it included only the actual monetary transactions of the treasury. The amount given in the text above is probably as near an estimate as could be made at the end of 1946.

erature are just as much "workers" as those who labour for wages in industrial plants, nevertheless we follow here the customary use of the terms "labourers" and "workers" to denote the great mass of wage earners who are dependent for their daily living upon the pay envelopes which they receive. Labour relations will be treated under three heads: the relations between labour and the government, between labour and management and between the organized groups of labour themselves.

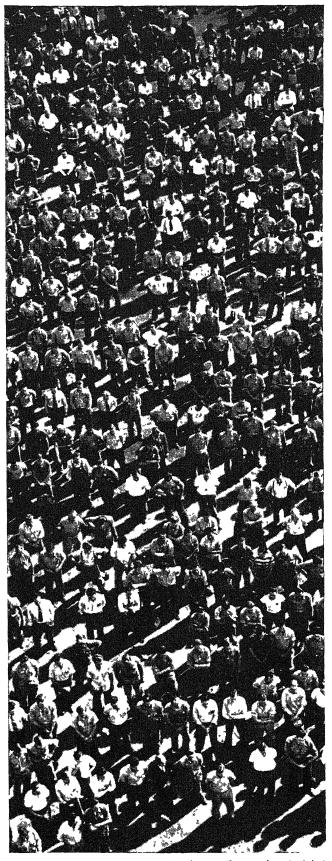

The Intervention of Government.-Although in the 19th century several of the states had passed laws regulating labour conditions, such as the establishment of a minimum wage, the prohibition of child labour, the liability of the employer for injury to workers through defective machinery or the neglect of safety devices, it was not until the 20th century that the federal government began to intervene in labour relations by legislation. A separate department of labour was added to the cabinet in 1913, but for a score of years its chief function was the collection of statistics and the proffer of advice. The constitution gave the president no power to interfere in labour controversies, except when it was necessary (as in the case of the great railroad strike of 1877 or the Pullman strike of 1894) to call upon troops to preserve law and order; and the only authority that congress had to exercise control (indirect) over labour relations was its constitutional grant of power to regulate interstate commerce.

With the advent of the New Deal, however, the government began to interest itself seriously in the problems of labour. For it was a major policy of President Roosevelt to further industrial democracy by the relief of unemployment, the securing of a living wage and the promulgation of fair codes of dealing in business. Although the National Industrial Recovery act of June 1933 had been declared unconstitutional by unanimous decision of the supreme court on May 27, 1935, the latter year saw the passage of the National Labor Relations act, which compelled employers to bargain collectively with the labour unions. It was hailed by labour leaders as their Magna Carta, and was upheld by a 5 to 4 decision of the supreme court in April 1937. By that date the National Labor Relations board, set up to implement the act, had handled some 2,000 labour disputes and settled three-fourths of them amicably; and by July 1940 the board had a record of having settled by agreement more than 90% of the 28,000 cases handled.

A further step in the government's policy of advancing the interests of labour was the Fair Labor Standards act (popularly called the Wages and Hours act) of June 14, 1938.

The object of this act was "to put a floor under wages and a ceiling over hours." After the first year of its operation, wages were to be increased on a sliding scale from 25 cents to a minimum of 40 cents an hour, and hours were to be reduced from 44 to a maximum of 40 a week. Numerous classes were exempt from the act: farmers, seamen, transportation workers, domestic servants. Children under 16 were not to be employed in industries whose products entered into interstate commerce. Overtime work was to be paid 50% higher per hour. Though critics of the act complained that the government was overstepping its constitutional power in prescribing wages and hours, the act was not (like its predecessor, the NIRA) invalidated by the supreme court, now "liberalized" by Roosevelt appointments.

The Fair Labor Standards act was notable as the first act of congress in U.S. history for the federal regulation of wages and hours.

"Pep talks" by army and navy officials were frequently scheduled to help speed U.S. war production. These aircraft workers were on their lunch hour as they listened to an address by an army officer in 1942

With the year 1940 and its serious attention to the problems of national defense came a decided change in the relations of government and labour. The government itself became the largest employer of labour, allotting billions of dollars worth of contracts for war materials, erecting thousands of manufacturing plants and creating new agencies for the maintenance of uninterrupted production and industrial peace. It sought the co-operation of organized labour. Sidney Hillman, vice-president of the C.I.O., was appointed a member of the advisory defense committee and in Jan. 1941 was made assistant director of the Office of Production Management. On March 19, 1941, a National Defense Mediation board was set up, consisting of 11 members representing management, labour and the public.

The extraordinary number of strikes (five times as many in the first 7 months of 1941 as in the corresponding months of 1940) moved congress to consider measures of coercion. Rep. Leland Ford of California proposed a bill to make strikes in war industries punishable with 25 years of imprisonment and even with death in case the strike produced fatalities. In June, federal troops occupied the plant of the North American Aviation company at Inglewood, Calif., and in August the navy took over the federal shipyards plant at Kearny, N.J., both of which held large government contracts. During October and November John L. Lewis, president of the powerful miners' union, held over the head of the government the threat of a strike of 400,000 bituminous coal miners, and on Dec. 5, two days before the Japanese attack at Pearl Harbor, a strike of 100,000 railway workers was averted only by the direct appeal of President Roosevelt.

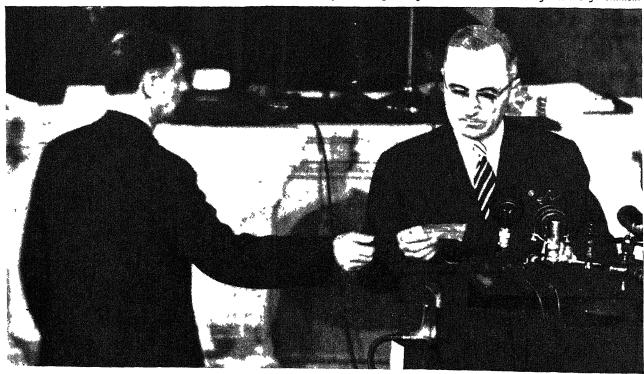

When war was declared, however, the tension between the government and labour was relieved. In a December conference representing 12 industrial leaders and 6 members each from the two great federations of labour, both labour and management agreed to refrain from strikes and lock-outs for the duration of the war, and recommended the establishment of a more efficient agency to replace the NDMB.

The latter was abolished by the president in Jan. 1942, and its functions were transferred to a National War Labor board headed by William H. Davis.

The no-strike pledge, however, was honoured more in the breach than in the observance. The "little steel" formula of July 1942 limited wage increases to 15% above the levels of Jan. 1, 1941; but labour contended that prices had risen by nearly 40%. Moreover, labour feared that the loss of overtime wages and the return of millions of veterans after the war would endanger its gains, and it resented the Smith-Connally act of 1943 which forbade strikes in essential war industries. As a result, there were three times as many strikes in 1943 as in the preceding year, and in the first five months of 1944 they increased by 42%. John L. Lewis, the stormy petrel of labour, led his 400,000 bituminous miners out of the pits three times in 1943, cutting the production of coal by over 30,000,000 tons. Encouraged by Lewis' success in securing wage increases, the five railroad brotherhoods voted by a majority of 97.5% to begin a strike on Dec. 30 which would have tied up all the roads of the country. It was not until President Roosevelt had put the railroads under army control that the brotherhoods called off the strike on the eve of the deadline.

These labour revolts roused great indignation (directed chiefly against Lewis) among the public and among U.S. soldiers abroad. The Germans and Japanese took advantage of them to broadcast to the world that the economic system of the United States had broken down in chaos. The last year of the war brought no pause in labour's demands for higher wages, which it declared industry could well afford to pay out of its enormous war profits. And when hostilities ceased, an epidemic of strikes broke out in the automobile, steel, oil, coal, lumber, traction, radio,

Pres. Truman reading a message announcing the end of the rail-road strike on May 25, 1946. The news came as he addressed congress, asking for legislation to forbid strikes against the government

telegraph, electric and building industries. From Oct. to Dec. 1945 the NLRB conducted as many strike votes as it had during the first two years of the operation of the Wagner act of 1935.

President Truman tried to stem the tide by the appointment of fact-finding committees to investigate the merits of the workers' demands. Immediately after V-J day he had defended in a radio address his "deliberate refusal" to step in and "lay down the law to business and labour," declaring that we must "get away as quickly as possible from government controls and get back to the free operation of our competitive system" through collective bargaining. But now he extended "government controls" to the point of insisting that labour and management should abide by the decisions of the lact-finding commissions without question—a challenge which neither labour nor management was disposed to accept.

The dawn of the year 1946 saw major strikes in progress or threatened involving nearly 2,000,000 workers. No longer deterred by the plea of war emergency and determined to have what they believed to be their just share of the war profits, the men in a score of the leading industries of the country were making demands for wage increases which management declared would bankrupt their companies. The spring months of 1946 marked the peak of the government's embarrassment. President Truman's advisers were at sixes and sevens over the proper policy to pursue, and the Democratic congress, with the autumn elections approaching, was wary of alienating the labour vote, 72% of which had been cast for Democratic candidates in 1944. When the soft coal contract expired on March 31, Lewis again led his 400,000 miners out of the pits, demanding, besides wage increases, the levy of 10 cents a ton on all coal mined, to constitute a "health and welfare fund" of \$60,000,000, to be administered by the union. As soft coal furnished 95% of the locomotive power and more than half the electrical and mechanical power of the country, the new strike threatened a general industrial paralysis. Steel production fell to 54% of capacity, 350,000 automobile workers were thrown out of employment, and train schedules were drastically cut.

At the same time the engineers and trainmen of the railroad brotherhoods refused arbitration, and a walkout of 200,000 maritime workers was set for June 15. On May 17 the president again took over the railroads, and a week later seized the mines; he declared that he would use the army, navy and coast guard to keep the ships running if the maritime strike materialized. Lewis was undisturbed by the government's action, repeating his defiant slogan of 1943: "You can't mine coal with bayonets." The critical labour situation roused President Truman to unwonted assertiveness. On May 24 he addressed the nation by radio: "This is a contest," he said, "between a small group of men and their government. The strike is a strike against the government. It must meet the challenge or confess its impotence."

When on May 29 Lewis signed a contract with the solid fuels administrator, Secretary of the Interior Julius A. Krug, granting substantial benefits to the union, the men went back to work.

But on Nov. 15, 1946, Lewis, for the eighth time since 1940, again precipitated a crisis. He declared that the government had not lived up to the agreement of May 29 and arbitrarily annulled the Krug-Léwis contract. He did not order the miners to leave the pits, for that would have made him liable to the penalties of the Smith-Connally act of 1943, which forbade the incitement to strikes in government-managed industries. Nevertheless, his action was a

direct encouragement to the men to leave the mines on the ground of "no contract, no work." With the cold weather approaching and supplies of coal dangerously low, the 400,000 miners quit work. Factories were closed down, train schedules were cut, brownouts were ordered in 28 states, and appeals were made by governors and mayors for the utmost conservation of fuel. This time the government was determined to have a final showdown to test the power of one man to cripple the industries of the country and cause suffering for 140,000,000 people. A federal court order enjoined Lewis to cancel his annulment of the Krug-Lewis contract, and when he refused to obey, he was summoned to stand trial for contempt of court. On Nov. 25 he appeared in court, silent while his attorneys argued that the government's action violated the Clayton act of 1914 and the Norris-La Guardia act of 1932 forbidding injunctions in labour disputes. The government, on the other hand, maintained that the acts did not apply, since the case was not a labour dispute but a move of the government to protect the public welfare. Judge T. Alan Goldsborough on Dec. 4 imposed a fine of \$10,000 on Lewis and \$3,500,000 on the United Mine Workers union. With appeal to the supreme court pending, and the announcement that President Truman would address the nation on the radio on the evening of Dec. 8, Lewis surrendered on Dec. 7, and ordered the miners to return to work under the terms of the Lewis-Krug agreement of May 29. The country breathed a sigh of relief; the President cancelled his address. The crisis had been passed; but a government policy for the curbing of industrial strife was still to be found.

Management on the Defensive.-Labour-management relations could be summed up in one phrase: mutual defiance. It was not simply a question of wages. Beneath the conflict over dollars and cents there was a bitter battle of charges and countercharges as to the ultimate aims of the two parties. Labour leaders repeatedly accused the managers of plotting to "smash the unions," while the managers charged labour with the presumption to dictate to them how to run their own businesses. A new type of strike (imported from France) was introduced in 1937 by the newly created Committee for Industrial Organization headed by Lewis. This was the "sit-down" strike, in which the men quit work but intrenched themselves in the factories to prevent strikebreakers from taking their places. Although it was a case of trespassing on the property of the owners, Secretary of Labour Frances Perkins hesitated to condemn the sit-down strike as illegal, and Governor Frank Murphy of Michigan refused to call out troops to evict the strikers. The sit-down strikes soon died down; but they left a wariness in the minds of the owners which increased their opposition to organized labour. Conferences called to compose the strife ended in failure.

With U.S. entrance into World War II, the unions pressed their demands for the closed shop, which was anathema to the employers, and for the participation of labour in the management of industry. For example, Walter Reuther of the United Automobile Workers, largest C.I.O. union, urged that his union be authorized to make a survey of the industry and submit a plan for its conversion into war production. Better relations between labour and industry were promised when, at the invitation of Eric Johnston, president of the United States Chamber of Commerce, the president of the American Federation of Labor (William Green) and the president of the C.I.O. (Philip Murray) met Johnston at Washington late in July 1942

"Back to Normal." Shoemaker of the Chicago Daily News painted with dry humour the postwar continuation of friction between labour and management at Montgomery Ward & Co.

and agreed to work together for increased production and sustained employment. But fair words were not enough. The year 1943 saw an epidemic of strikes in essential war industries like steel, coal and rubber, which moved congress to pass (over the president's veto) the Smith-Connally bill outlawing strikes in war industry plants.

The strife between labour and management continued unabated during the war years, and grew still more intense after V-J day. President Truman called a conference in Washington on Nov. 5, 1945, but it ended in the usual deadlock. Charles Edward Wilson and Alfred P. Sloan, Jr., of the General Motors corporation published a large-type advertisement in the metropolitan papers on Dec. 31, declaring that if business were to surrender responsibility for its management to any government agency or labour union it would mean the death of the U.S. system of competitive enterprise. "General Motors," they said, "will not assume the role of initiating such a policy." Both management and labour protested that they had no intention of trespassing on the other's rights and privileges.

Management, realizing that the time had passed when it alone could dictate rates of pay and hours of labour, accepted the principle of collective bargaining as prescribed by the Wagner act of 1935; and labour leaders from Lewis down asserted that they were not aiming to deprive management of its proper functions. Nevertheless, the record showed an increasing encroachment of the unions on the domain of management. They had made demands for the unionization of foremen, for union participation in company policies, for union-controlled benefit funds at industry's expense, and for access to company balance-sheets. Organized labour, with some 15,000,000 of the 58,000,000 workers enrolled in its ranks, and with large sums of money in its treasuries, showed no disposition to relax its drive for an equal, if not a decisive, voice in the conduct of U.S. business.

Labour vs. Labour.—In the house of labour itself, dissension was rife all through the decade. For 50 years the

A.F. of L. had been the dominating labour organization, comprising all the major unions except the railroad brotherhoods and the Western Federation of Miners. Green, president since 1924, had followed the conservative policy of his predecessor Samuel Gompers, eschewing political action and depending wholly on economic bargaining to secure benefits for the workers. But a serious split in the A.F. of L. came in 1937, when ten unions, expelled from the federation for noncompliance with the rules, proceeded to form the Committee on Industrial Organization (later renamed Congress of Industrial Organizations) under the leadership of Lewis. As against the "horizontal" type of craft unions of the A.F. of L., the C.I.O. adopted the "vertical" or mass type, organizing the workers, both skilled and unskilled, in any one industry into one big union.

The more democratic and aggressive C.I.O. grew by leaps and bounds, drawing many unions from the A.F. of L., until by the end of the decade the organized workers of the country were almost equally divided between the two great federations. Naturally, the rivalry between them was intense and the disputes over membership recruiting and spheres of jurisdiction were constant. The A.F. of L. accused the C.I.O. of harbouring communists in its ranks and frowned on the manoeuvres of its Political Action committee under the vigorous leadership of Sidney Hillman. Those in favour of unity argued that if the labour organizations had stopped quarrelling and presented a united front, as President Roosevelt urged them to do, they might have figured prominently in governmental agencies or even had representation in the cabinet, like the labourites Ernest Bevin, Clement Attlee and Herbert Morrison in Churchill's British cabinet.

Shortly after Pearl Harbor Lewis did, indeed, write to Philip Murray (who had succeeded him as president of the C.I.O.) and Green proposing a union of the two federations, but on the impossible condition that the two presidents step out and leave him to compose a new slate of officers. The brash proposal only widened the rift between the organizations, and Murray retorted in a talk to the Press club in Washington a few days later: "Mr. Lewis is hell-bent on creating national confusion and national disunity." Management, too, tried to heal the breach. In March 1945, when the Allies were closing in on the retreating nazi armies, Eric Johnston and Henry Kaiser met with Murray and Green and signed a labour-management charter for industrial peace. President Roosevelt sent his congratulations, but Lewis sneered at the charter as a fake, and Ira Mosher, president of the National Manufacturers association, called it a collection of "generalities" and rebuked Johnston for publishing it at just the moment when management was planning new moves for the curbing of the unions. (See also Employment; Labour Unions; Re-LIEF; SOCIAL SECURITY; STRIKES AND LOCK-OUTS; WAGES AND Hours.)

The Farmers' Fortunes

Agriculture had been the Cinderella of the U.S. economic household. In the era of industrial expansion which followed the Civil War, the manufacturer enjoyed the protection of high tariffs, the banker profited by both the interest on government bonds and the loans of currency based on them, the railroad builders were granted immense blocks of public land and advances of millions of dollars for construction; coastwise and internal shipping was restricted to vessels of U.S. registry, and labour was safeguarded against the competition of the low wages which prevailed in the European countries. But the farmer,

aside from his free homestead, enjoyed no government favours. As a pioneer he was in debt for his equipment. His mortgaged land bore heavy interest charges. He suffered under what he believed to be excessive railroad and elevator rates. He was obliged to sell his crops at prices determined by world markets, while paying for his tools and fencing and building materials in a sellers' market, protected by the tariff. U.S.-made plows and reapers were actually sold in Canada and Europe at prices lower than those charged to the U.S. farmer. The "agrarian crusades" of the Grangers in the 1870s and the Populists in the 1890s against these grievances were met with a scornful hostility by the moneyed interests of the east and with uninformed indifference on the part of the government at Washington.

True, World War I had brought a moment of prosperity to the farmer, with wheat at \$2.20 a bushel; but when the war was over and the farms of Europe were again in full production, his plight was worse than before. In the flush period he had extended his acreage to land purchased at a price too high for its crop values and bought on credit farm equipment which left him deeper in debt. He had no part in the "boom" of the 1920s. And if the "farm bloc" did arouse congress to the seriousness of the agricultural situation and secure the appointment of a Federal Farm board and the passage of a few acts ostensibly for farm relief, the latter were less in the nature of any direct aid by the government than of expedients to "help the farmer borrow himself out of debt." Every attempt of the farm bloc to get effective federal aid for agriculture, like the McNary-Haugen bills, met with failure. When the great depression came, the farmer's plight was so desperate that he was burning his corn for fuel, pouring his milk into the streets and meeting with shotguns the sheriff who arrived to sell his foreclosed property.

In striking contrast to the apathy of the Coolidge and Hoover administrations toward the farm problem, President Roosevelt, a city-born aristocrat (both Coolidge and Hoover were born on a farm), made effective federal farm relief a major aim of his administration. To bring farm prices up to the level of the years 1909–14 was the purpose of the Agricultural Adjustment act of 1933, which provided government subsidies for farmers who agreed to eliminate surplus production of certain enumerated commodities like grain, cotton and hogs. The act was annulled by the supreme court in Jan. 1936, a majority of six justices (against Stone, Brandeis and Cardozo) holding that congress had no power to regulate agricultural production or to levy a tax on the processing of raw agricultural products to provide funds for subsidies to the farmers.

Undeterred by this setback, the advocates of farm relief got through congress a second Agricultural Adjustment act in Feb. 1938, which eliminated the objectionable tax provision and which Secretary of Agriculture Wallace declared to be the most beneficent piece of legislation ever passed for the benefit of the farmer. It was an elaborate act of more than 130 pages, inviting the raisers of surplus producing crops like cotton, wheat, corn, tobacco and rice, to agree by plebiscites to limit their production to quotas prescribed by the administrative agency, in return for subsidies from the government. It contained also provisions for soil conservation and for the maintenance of what Secretary Wallace called "an ever normal granary": the application of Joseph's plan in Egypt to balance the poor yields of bad seasons with the stored surpluses of the good seasons. The government, through the Commodity Credit corporation, was authorized to extend loans on stored surpluses and even, through the Surplus Commodities corporation, to purchase surpluses to distribute to persons on relief. In the fiscal year 1938 the latter agency purchased \$47,000,000 of such products to help feed an average of 2,000,000 needy families a month.

Under the new act the situation of the farmers was greatly improved. Whereas in 1860, agriculture had represented one-half the national wealth and had enjoyed nearly a third of the national income, its share of the country's wealth had dropped to 7% in 1933, and its income had declined to a paltry \$4,300,000,000. In 1938, however, in spite of the floods and droughts of 1934 and 1936, the farm income rose to \$8,880,000,000. Prices for farm products had increased from an index of 65 (based on the figures for 1910–14) in 1932 to 121, and there were over 10,000 farmers' co-operatives with a membership of 3,270,000 doing a yearly business of over \$2,500,000,000.

There were, to be sure, two large drawbacks. The first was the burden of farm mortgages, which had risen to more than \$7,000,000,000 and on which high charges were made for interest and renewals. Secondly, there was the growing evil of farm tenancy. About 40% of U.S. farmers were landless tenants or sharecroppers, without the incentive to continuous effort for improved operation which comes from actual possession of the land. The Bankhead-Jones act of 1937 provided a measure of relief by loans through the Federal Farm Security administration of some \$10,000,000 to 1,840 landless farmers; but it was only a drop in the bucket. Tenancy increased steadily, until by 1940, out of the 32,000,000 people living on farms, 13,-000,000 were landless. Though all parts of the country were plagued by farm tenancy, it was in the southern states that the evil was prevalent; President Roosevelt spoke of the agricultural situation of the south as the U.S. number one problem. In 1940, the government held first mortgages representing \$40,000,000 loaned to over 13,000 tenants for purchases of land, and had in storage 18,000,ooo bales of cotton.

War and Prosperity.-The effects of World War II on agriculture, as on every phase of life, were revolutionary. By 1940, grain fields in Europe and Asia were devastated by bomb craters and rolling tanks; animals were slaughtered by the millions; and countless peasants were driven into an exile of starvation. The United States, as yet uncommitted to the struggle, had an overabundance of food of all kinds; the years from 1937 to 1940 had seen an increase of 27% in crop production (because of favourable weather and improved farm machinery), in spite of a reduction in farm acreage and farm labourers. President Roosevelt recommended an appropriation of \$50,000,000 to feed destitute people in Europe, as after World War I; but objection to this humanitarian proposal was voiced on the ground that whatever food was sent to the countries under Hitler's control would probably be seized by the nazis.

Soon after the meeting of congress in Jan. 1941, however, a bill was introduced into the house authorizing the shipment of unlimited supplies of food, as well as of munitions, tanks, lorries and other military equipment. After a heated debate in congress, the lend-lease bill was passed and signed by President Roosevelt. The United States undertook to furnish Great Britain during the ensuing year 5,000,000,000 lb. of processed milk, 1,500,000,000 lb. of pork and lard, 500,000 dozen eggs, and millions of pounds of poultry. Up to 1946, the value of agricultural products allocated to a score of countries by lend-lease reached the huge sum of \$5,426,000,000. At that, only about 7% of the nation's food was so used, while 80%

was consumed by the civilian population at home and 13% by the U.S. armed forces.

Farm prices reached a peak in the midsummer of 1945, when wheat sold at \$1.51 a bushel as against 65 cents in Oct. 1940, corn at \$1.13 as against 59 cents, and cotton at 22.3 cents a pound as against 9.3 cents. The problem was not low prices but the lack of manpower and machinery for the farmer. Though local draft boards were asked to exempt agricultural labourers as far as possible, the farms lost some 2,000,000 workers who either joined the armed forces or went into war industries, and whose place was only partially filled by women and children, and labour imported from Mexico. A second embarrassment for agriculture was the shortage of farm machinery, caused by the demands of the factories for steel and other metals, which resulted in a reduction of about 20% in the allotment for tractors, reapers and combines. For all that, in the year 1943, a farm population 10% less than that of 1918 produced 50% more food on 2% fewer acres. "Food will win the war and write the peace" was the slogan of Secretary of Agriculture Claude Wickard.

From a figure of about \$10,000,000,000 a year in the period 1936-41, the farm income rose to \$24,000,000,000 by 1946. But this gross income was cut down to a net of \$13,000,000,000 by the increased cost of fertilizer, labour and machinery. However, it meant a per capita income of more than \$1,500 a year for the farmer, as against an average of \$550 in the period 1936-41. The burden of farm mortgage debt was steadily reduced, until at the close of 1945 it was only half the peak figure of \$10,780,000,000 of 20 years earlier, while the department of agriculture estimated that the total assets of the farms had increased from \$53,700,000,000 in 1945 to \$82,800,000,000 in 1945.

In an address at New York city, Dec. 6, 1945, the new Secretary of Agriculture, Clinton P. Anderson, predicted a bright future for the farmer. The production of meat, he said, in the first quarter of 1946 would be sufficient to leave a balance of 150 lb. per capita for domestic consumption, after feeding U.S. occupation troops abroad and contributing the U.S. quota to U.N.R.R.A. But neither Secretary Anderson nor anyone else could foresee the shortages in food supplies which would be created during the year by a combination of circumstances. Trucking strikes prevented the delivery of many common articles of daily consumption to the groceries; mantime strikes stopped the unloading of ships containing millions of pounds of sugar. The end of ceiling prices with the expiration of the OPA controls on June 30, 1946, led to an expansion of black market operations, until modified controls were imposed a few weeks later, only to be taken off again in October, first from meat and then from all other commodities except sugar and rents. There were more cattle, sheep and hogs in the country than ever before, but they were withheld from the market in speculative anticipation of higher prices. Thousands of butcher shops were closed, or had no meat for customers who were unwilling to pay the exorbitant black market prices. The public pressure for relief became so strong that President Truman himself made the supply of meat at reasonable prices a major item of the government agenda in the autumn of 1946 and the subject of a nation-wide address on the radio. As the year drew to a close there was promise that the abnormalities in supply and demand would be remedied and that the abundant crops and the abounding herds of livestock would ensure the country a stabilized and sufficient diet for all its people. (See Agriculture; also articles on separate crops and agricultural products.)

At the beginning of the decade 1937-46, U.S. railroads were in a precarious situation. Only 13% of them showed a profit, and 30% of the mileage was in the hands of receivers. The average price of railroad bonds had fallen from \$95.50 in 1930 to \$55.90, and stocks from \$91.56 to \$26.06. Billions of dollars were needed for new equipment. The competition of buses, trucks, pipe lines and planes was causing heavy inroads on freight and passenger service. Taxes and wages were rising faster than revenues. To meet the crisis, the railroads made heroic efforts. Mammoth locomotives were built to haul long trains of freight at express speed. Road after road put into service luxury trains and comfortable overnight coach trains like the New York Central's "Pacemaker" and the Pennsylvania's "Pathfinder," which carried thousands of people for whom lower fares were more important than lower berths. In spite of all their efforts, however, the railroads were hardly better off at the beginning of the 1940s than they had been three years before. They were realizing only 2.25% on their investment.

It was the U.S. preparation for and participation in World War II that offered the roads the opportunity for unexampled prosperity and put on them a load which it hardly seemed possible for their depleted resources to bear. Thousands of tons of food and war material had to be brought daily to camps and ports of shipment. Millions of troops had to be moved. The danger of submarines on the Atlantic coast threw upon the railroads the transportation of vast quantities of material which had gone by water, and the war in the Pacific required 30% of U.S. rail facilities to service the ports of the west coast, as against 7% in World War I. On Dec. 18, 1941, President Roosevelt created the Office of Defense Transportation under Joseph B. Eastman to act with the chief railroad heads in co-ordinating transportation policies. The government did not take over the roads, as it had done (with rather unsatisfactory results) in World War I. Instead, the managers worked in close co-operation with Eastman's aides in Washington, D.C., and other cities of the country. With the flow of goods for lend-lease and U.N.R.R.A., with onehalf the Pullman and one-third the coach accommodations needed for the movement of troops, the people were urged to refrain from unnecessary travel and, except for commuters' short distances, civilian train schedules were drastically cut.

Naturally, the rising cost of living brought demands from the railroad workers for increased wages. Three times after U.S. entrance into the war, the nation's vital transportation system was threatened by railroad strikes. A nation-wide strike was set for Dec. 7, 1941, on a demand for a 30% rise in wages; but a settlement was made just prior to the attack on Pearl Harbor, by an increase of 76 cents an hour, at an estimated cost of \$300,000,000 to the roads. A second and more serious crisis came in the second week of Dec. 1943, when the workers voted by a majority of 97.7% to strike for a 30% rise. On Dec. 19 President Roosevelt called in conference the representatives of the five railroad brotherhoods and the carriers, after having two days before ordered the secretary of war to take over the roads. It was not until Christmas Eve that the brotherhoods called off what President Roosevelt warned was a strike against the government. The roads were returned to the owners the next month.

The third and most serious problem arose in the spring of 1946. With the war over, the appeal to patriotism lost much of its force. In the welter of strikes that characterized

the early months of the year, that of the railroad trainmen and the locomotive engineers, with a combined membership of 293,000, threatened to be even more crippling to the nation's industries than those in steel, motors or coal. After all the steps provided in the Railway act of 1926 had failed to bring agreement, the strike, tying up the 230,000 miles of rail in the country, began on May 23. President Truman immediately turned the railroads over to Col. J. Monroe Johnson (who had succeeded Eastman as ODT director), and the next evening spoke to the nation on the air. "This is a contest," he said, "between a small group of men and their Government. . . . The Government is challenged as seldom before in our history. It must meet the challenge or confess its impotence. If sufficient workers to operate the trains have not returned by 4 P.M. tomorrow . . . I shall ask our armed forces to furnish protection to every man who heeds the call of his country in this hour of need." The president then went before a joint session of congress to reiterate his strong stand. As he was speaking a message was handed to him which he read to the cheering members. The brotherhoods had accepted the 181/2 cents an hour raise which had been agreed on in the steel and motor industries.

Merchant Marine.—The development of the U.S. merchant marine during the decade was well nigh incredible. In 1937, only 22% of U.S. imports and 36% of U.S. exports were carried in U.S. ships. A maritime commission set up the previous year planned a 10-year program for the construction of 50 ships a year, purchased the Dollar Line, and opened schools for the training of marines. The "Good Neighbour" fleet of fine vessels (the "Argentine," the "Brazil" and the "Chile") was built, and the "America," largest merchant ship ever constructed in U.S. yards, was christened by Mrs. Roosevelt in Dec. 1939.

The outbreak of World War II, however, brought embarrassment to the merchant marine. The Neutrality act of Nov. 1939 barred U.S. ships from belligerent ports and combat areas, shutting them out of English, French, Dutch, German and Belgian harbours. Submarine attacks raised insurance rates sharply and took a toll of nearly 4,000,000 tons of U.S. shipping during the war. At the peak of the danger in 1942, some 500 German submarines were destroying merchant vessels faster than they were being built.

With the repeal of the Neutrality act on Nov. 17, 1941, and the threat of war with Japan impending, there was a remarkable spurt of energy in U.S. shipyards. President Roosevelt called for the construction of 8,000,000 tons in 1942 and 16,000,000 tons in 1943; and both these figures were exceeded. Shipyards had launched 28 cargo ships in the year 1939; in the single month of Dec. 1943 they launched 208. About 30% of U.S. cargo space in 1943 was devoted to lend-lease shipments, which reached a total of \$14,000,000,000 in July of that year. When the war ended, the United States had a merchant tonnage of some 50,-000,000, by far the largest in the world. It had grown from 17% of the Allied tonnage in 1940 to over 60% in 1945; at the peak of building, 700,000 workers (14% women) were employed in shipyards. Great Britain, starting in 1939 with double the tonnage of the United States, was able during the war to construct only 9,300,000 tons against submarine losses of 11,700,000 tons; while new U.S. construction of 38,250,000 tons offset U.S. losses of 3,800,000, ten-fold. As a result, on Jan. 1, 1946, the nation had a net gain of 34,400,000 tons against Great Britain's loss of 2,400,000 tons.

A report on wartime trade released by the U.S. Chamber

of Commerce on Aug. 19, 1946, showed that U.S. exports during the war (not including supplies for armed forces abroad) reached a total of \$45,000,000,000—more than the combined value of exports during the 14 previous years. Nearly three-fourths of the sum represented lend-lease exports to the Allies. However, there was a serious imbalance between exports and imports. The latter amounted to only \$4,300,000,000,000, compared with an export figure of some \$10,000,000,000,000.

Airlines.—The progress of civil aviation during the decade was also phenomenal. From a network of 2,000 miles in 1936, the routes grew steadily until they covered not only the United States and South America, but extended to the far parts of the world. Pan American Airways took the lead. In the spring of 1939, P.A.A. clippers inaugurated a regular transatlantic service for passengers and mail, which was soon extended to Alaska, South America and the far east. The next year P.A.A. flew 69,500 miles of routes.

When the war came, the company was busy ferrying bombers across the Atlantic to Africa, and then on to Cairo and over the Indian ocean to Burma and China. Naturally, military aviation had priority during the war, but, limited as it was in plane construction, civil aviation by no means withdrew from the field. On the contrary, the depredations of submarines on merchant shipping made air service the more necessary. By the end of 1944, P.A.A. was linked to 61 countries and during that year it carried more than 3,500,000 passengers.

La Guardia field on Flushing bay, Long Island, was opened on Dec. 2, 1939, and before the end of the year was handling 150 flights a day. Congress recommended an appropriation of \$435,000,000 for the construction of 3,500 airports and the training of 20,000 young pilots. Before the war was over, work was begun on the Idlewild field on Jamaica bay, designed to be the "air hub of the world," with an area eight times that of La Guardia field and a capacity of 1,000 flights a day on its 13 mi. of runways.

On June 23, 1938, the government created a Civil Aeronautics authority to function in somewhat the same way as the ICC did in the case of the railroads. Some of the railroad magnates, regarding the airways as a serious competitor, advocated putting the CAA under the authority of the ICC; but the airways managers resisted this, maintaining that their lines were supplementary to rather than competitive with the railroads, since they carried only lighter and perishable freight which called for speedy delivery.

For six weeks in Nov. and Dec. 1944 an International Civil Aviation congress, representing 52 nations, sat at Chicago to devise rules to govern the "freedom of the air." A majority of the nations accepted the articles which resulted from the conference: namely, the abolition of closed air zones, the right of free passage across national boundaries, the privilege of taking on or discharging freight at intermediate points on a flight, and many other provisions designed to make the air as free as the seas.

On V-J day, the U.S. aircraft industry was the biggest industry in the world, chiefly, of course, because of the enormous production of military planes, the 150,000th of which was completed on the second anniversary of Pearl Harbor. But with the close of the war and the rapid cancellation of aircraft contracts by the army and navy, civil aviation was in a position to make giant strides and to profit by the remarkable inventions made during the war for the increase of speed and safety. In Oct. 1945 priorities

for air travel were abolished. (See also Aviation, Civil; Railroads; Shipping, Merchant Marine.)

The Armed Forces

Partly as a result of the U.S. heritage of distrust of standing armies and partly because of a sense of security in isolation from the turmoil of the old world, the weight of U.S. public opinion and governmental policy had been traditionally opposed to military preparedness. In every war in which the nation had been involved, the same pattern had been followed: a belated and feverish effort to meet the danger after it had become acute, and a rapid demobilization of the armed forces after the war was over. The situation in respect to World War II conformed to type.

The active army forces in 1938 comprised 183,500 men, or 0.3% of the population, as compared with 17.6% in Italy and 14.2% in France. President Roosevelt was in advance of public sentiment in realizing the danger of the aggression of the Berlin-Rome-Tokyo axis. Not only did he make personal appeals to the dictators to stay their course of conquest, but he sought to alert congress and the U.S. people to the necessity for military and industrial preparedness.

When Hitler launched his blitzkrieg in the spring of 1940, rapidly subduing Denmark, Norway, the Netherlands and Belgium, a Council of National Defense was set up on May 28, consisting of six cabinet members and seven advisers, patterned after the council of 1916. But instead of following the example of President Wilson in making Bernard Baruch an industrial "czar," the administration entrusted the task of industrial preparedness to a board called the Office of Production Management, consisting of William S. Knudsen, Sidney Hillman and Secretaries Henry Stimson (war) and Franklin Knox (navy).

Ever since World War I the question of compulsory military training had been under discussion; but it took the tragic events of the summer of 1940 to bring it into existence. In Sept. 1938 (the month of Munich) a Gallup poll revealed that only 37% of the respondents favoured universal military training; but when France fell in June 1940, leaving Great Britain alone to withstand Hitler in the west, the figure rose to 64%. On Sept. 16, 1940, President Roosevelt signed the Burke-Cochran Selective Training and Service act.

The procedure of registration and induction followed closely the precedent of 1917. On Oct. 16 some 16,000,000 men between the ages of 21 and 36 were registered at 125,000 centres. Twelve days later Secretary Stimson, blindfolded, drew the first number (158) from the same glass bowl that had been used in 1917. The law divided the inductees into a number of classes ranging from those wholly fit for military service (I-A) to those exempt, as ministers or theological students (IV-D) and those disqualified by physical or moral defects (IV-F). By June 1941 there were 1,500,000 men in the camps, and congress authorized (by a vote of 203 to 202 in the house) extension of the law for two and a half years. It had already, in March, voted an appropriation of \$4,000,000,000,000 for an army of 4,000,000.

After the United States entered the war in Dec. 1941, the armed forces increased by leaps and bounds, until on V-J day the army numbered more than 8,000,000 men, and the 3,866,000 in the navy and the marines and the 2,250,000 in the air force brought the total military strength up to more than 14,000,000. Three years of fighting from the frozen Aleutians to the hot sands of Africa and the steaming jungles of the Pacific islands, and from the coast of

Normandy to the heart of Germany had made the soldiers eager to get back to their wives and families. Demobilization brought the army down to less than 2,500,000 men by April 1, 1946, distributed in the Pacific area, Germany, Austria, and the countries of the middle and far east.

Presidents Roosevelt and Truman had committed the United States at Yalta and Potsdam to the policy of keeping sufficient troops in the conquered countries to prevent any resurgence of aggression and guarantee the establishments of governments chosen by the people in fair elections. But U.S. soldiers abroad had no relish for this job of policing after the war was over. In spite of the repeated pleas of Secretary of War Robert Patterson and Chief of Staff General Dwight Eisenhower, voluntary enlistments fell short of the numbers needed for the replacement of the men who had earned their discharge. It was estimated that a monthly quota of 35,000 to 40,000 recruits would be necessary to bring the army to an anticipated strength of 1,070,000 in July 1947. But the enlistments for the first two weeks of Nov. 1946 were only 9,295. Moreover, the 272,000 volunteers who enlisted for a year or 18 months would be lost to the army by July 1947.

The Navy.—The expansion of the navy, the branch of the service closest to the heart of President Roosevelt, kept pace with that of the army during the decade. From his boyhood, Roosevelt had been passionately fond of everything connected with the sea, and his seven years as assistant secretary of the navy in Wilson's cabinet had made him familiar with naval resources and problems. Large appropriations had been made in the Wilson administration for the building of "a navy second to none in the world"; but with the end of World War I, interest shifted to plans for disarmament. The United States had led the way in the Washington conference of 1921 by scrapping a large tonnage of war vessels already building or authorized. The Harding-Coolidge-Hoover administrations had given no encouragement to naval expansion; and when Roosevelt acceded to the presidency the economic condition of the country was so distressing that his first term was necessarily devoted to the relief and rehabilitation measures of the New Deal. The return of fairly stable conditions at home coincided with the threatening aspects of nazi and Japanese aggression in Europe and the far east. From then on, U.S. military and economic preparedness to thwart Hitler and his satellites became the president's major concern. "No combination of the dictator countries of Europe and Asia," he declared in his Columbus day address of 1940, "will stop the help we are giving to almost the last free people (the British) now fighting to hold them at bay."

There was little expectation that U.S. soldiers would be called upon to fight overseas, but it was the task of the navy to be alert in the protection of U.S. interests all over the globe. In his budget message of Jan. 1938 the president asked for a naval appropriation of \$1,000,000,000, or double that of the previous year; in May he signed a bill providing for an expenditure of \$1,126,546,000 for the increase of naval construction and personnel over a period of ten years. By the end of 1939, the nation had already passed its nearest competitor, Great Britain, in battleships, destroyers and submarines. The 674 fighting ships of 1937 had grown to 2,674 by 1943, and at the end of 1945 the nation had over 15,000 war craft of all types—a navy larger than the combined navies of the rest of the world. Some 2,200,000 tons of war vessels had been built in the three years from 1942 to 1945; and the navy personnel, including the marine corps and the coast guard, totalled nearly 4,000,000 men.

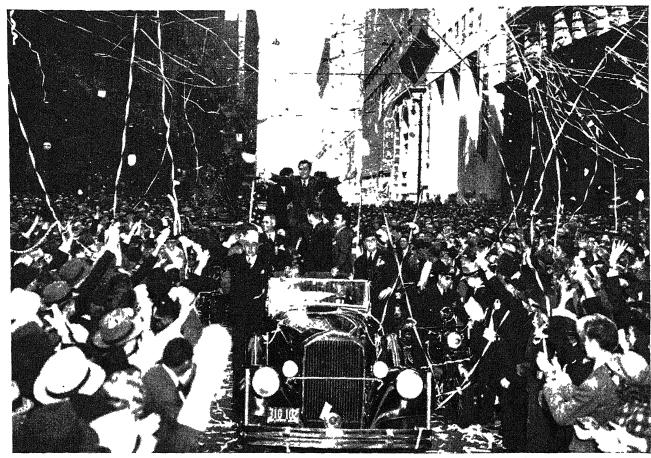

On signing the naval bill of 1938, President Roosevelt

Air cadets volunteering for pilot service with the U.S.A.A.F. are shown arriving at Randolph field, Tex., three months before the signing of the Selective Training and Service act in 1940

had said that any potential enemy should be kept many hundreds of miles from U.S. shores. Hence the drive to secure naval bases within what were held to be U.S. defense areas. In Sept. 1940 the president secured from Great Britain a 99-year lease of eight such bases along the Atlantic coast from Newfoundland to British Guiana in exchange for 50 over-age destroyers. In April and July 1941, U.S. forces occupied Greenland and Iceland, thus extending the "defense area" far out to sea. After sinking eight U.S. freighters, German submarines began in Sept. 1941 to attack U.S. war vessels, though the nation was still at peace. The destroyer "Kearny" was hit on Oct. 11 and 11 of her crew were killed. A few days later the "Reuben Jones" was sunk off the coast of Ireland with the loss of 76 men. President Roosevelt thereupon announced in his Navy day address of Oct. 27 that he had given the navy orders to "shoot at sight" at any submarine appearing in U.S. defense waters.

In the surprise attack of the Japanese at Pearl Harbor (Dec. 7, 1941), the U.S. navy suffered the greatest losses in its history: two battleships, three destroyers, a training ship and a mine-layer sunk, with nearly 3,000 casualties. This was followed by the rapid seizure of Wake, Guam and the Philippines by the Japanese; and the stage was set for the long hard struggle of the U.S. navy and marines to drive

Enthusiastic reception for Wendell L. Willkie in downtown Chicago, III., during his campaign as Republican presidential candidate in 1940

the Japanese step by step from their fortified atolls in the Pacific, until the atomic bombs dropped on Hiroshima and Nagasaki compelled surrender on board the battleship "Missouri" in Tokyo harbour on Sept. 2, 1945.

Air Force.—The third major arm in the war was the air force. Here again, as in the case of tanks, ships and guns, almost incredible expansion was characteristic of the decade. In 1940 less than 1,000 military planes a month were being built; but during the war years, with appropriations from congress rising from a few hundred million to several billions of dollars, construction was accelerated, new bases were established, tens of thousands of pilots and mechanics were trained, and enormous improvements were made in the speed, range, carrying capacity and safety devices of all types-bombing, fighting, pursuit, patrol and transport planes. By V-J day, the army air force was at a peak of more than 80,000 planes, with a total personnel of 2,400,-000 (more than the entire armed forces in World War I). Naval planes had increased from less than 2,000 to over 20,000.

In the 1920s, General William Mitchell had resigned from the air corps because his views on the supremacy of air power over naval power were not approved by the government. When such tragedies as Pearl Harbor and the sinking of the British ships "Renown" and "Repulse" off Malaya showed the vulnerability of the battleship to aerial attack, the contention of General Mitchell was revived, notably by Alexander P. Seversky in his Victory Through Air Power.

Still the naval authorities held to the view that the battleship was not an obsolete fighting unit.

Merger?—Another controversy concerned the organization of the armed forces. Should there be a single cabinet department of national defense, combining army, navy and air services? The army and the administration generally favoured the plan; but the navy opposed it, insisting on keeping its air force separate from that of the army. Naval officers pointed to the difference in function between the two services, and expressed fear that the merger would result in subordination of the lesser naval air force to the stronger army one. A poll of over 8,000 citizens, conducted by the Saturday Evening Post in the autumn of 1946, showed 95.4% answering in the affirmative the question: "Do you believe that we should maintain a military force during peacetime as an aid to insuring peace?" (See also Aviation, Military; Coast Guard, U.S.; Marine Corps, U.S.; National Guard, U.S.; Navies of the World; Submarine Warfare; World War II.)

Social Security

Though the preamble to the constitution declared one of the government's purposes to be "to promote the general welfare," it was not until the 20th century that the federal government took any steps to implement this recommendation by giving aid to the great number of its citizens who were unable to find employment or were handicapped by poverty, illness or old age. Such help as these unfortunates needed was left to local relief agencies or private charity. Inured to the doctrine of laissez-faire, the government felt no responsibility for their economic condition. This attitude was summed up in one of President Grover Cleveland's aphorisms: "It is the duty of the people to support their government, but not of the government to support the people." When the worst depression

in the country's history came, however, in the early 1930s, the government was shaken out of its complacent policy. The wheels of industry were stopped; 15,000,000 men were out of employment; the funds of local relief agencies and charitable organizations were exhausted. When the Roosevelt administration came into power in 1933, the president and his secretary of labour, Frances Perkins, set to work on a federal program for rehabilitation of the "forgotten man."

The Social Security act was signed by President Roosevelt on Aug. 14, 1935, and declared by him to be the "supreme achievement of his administration." It provided direct government aid for such needy and disabled persons as invalid mothers, crippled or homeless children, the blind and halt, as well as contributing from the national treasury to match state appropriations, and for a system of old-age and unemployment insurance financed by taxes on pay rolls. In 1939, the act was enlarged to include wives, widows and children in the benefits of old-age insurance, and the date of the initial payments was advanced from Jan. 1942 to Jan. 1940. Early in 1945 the Wagner-Murray-Dingell bill advocated a ten-year program of federal grants and loans to hospitals, sanitariums and health centres, the government paying up to 50% of the cost of construction, and the extension of the social security benefits to agricultural workers, seamen, and domestic servants. President Truman favoured also the coverage of 3,000,000 federal employees. In Dec. 1946 the Federal Security agency reported some 35,500,000 salary and wage earners insured under the act, and the reserve funds in the treasury from the tax assessments amounted to \$14,000,000,000. In 1941, the Servicemen's Readjustment act (popularly known as the G.I. Bill of Rights) was passed, to continue for five years after the war, guaranteeing to the veterans aid in obtaining employment, educational and training opportunities, hospitalization and loans for business, farms and homes.

Adequate housing, a prime necessity for social health, had been a major problem of the federal, state and local governments ever since the great depression. A United States Housing authority was set up in the department of the interior in 1937, and an appropriation of \$800,000,000 was made to provide for the clearance of slums, the construction of low cost houses and loans to local housing authorities. Under normal conditions, steady and rapid progress might have been made toward providing decent living quarters for rent or purchase at prices within the means of the "one-third" of the people of the country whom President Roosevelt described as "ill housed." But the sudden demands made by the program of national defense well nigh paralyzed the business of civilian construction. Camps had to be built for the men called up by the draft. The government spent billions on the construction of war plants. Some kind of housing had to be improvised for the vast number of workers flocking to the shipyards and the aircraft factories.

After the attack on Pearl Harbor the building of houses for the general public virtually ceased. All available material and manpower was requisitioned by the National Housing agency, set up by the president's executive order of Feb. 1942.

As the war was drawing to a close, it was estimated that no fewer than 12,600,000 houses and apartment units would be needed in the first postwar decade to take care of the waiting list and the increase in population and to replace substandard buildings. From 1940 to 1945, such construction averaged only 427,000 a year; and when veterans returned by the hundreds of thousands from the

war, many of them married, they were faced with a desperate housing situation. (See also Housing; Relief; Social Security.)

Threats to U.S. Democracy

The troubled generation which passed through two devastating wars and an interval of precarious truce saw the emergence of two "ideologies," or theories of political and economic organization which sharply challenged the traditional U.S. democratic-capitalistic system. Both these ideologies exalted the totalitarian state and spurned the liberal principles of free speech, representative government, parliamentary debate, an uncensored press, and tolerance of diverse party organizations, religious and racial minorities, labour unions, and in general those civil liberties guaranteed in the bills of rights of U.S. federal and state constitutions. The nazi-fascist type of totalitarianism, sponsored by Hitler and Mussolini, was primarily a political phenomenon, aimed at the abolition of the "rotten" corpse of democracy; while the communism of Stalin claimed to be the only genuine form of democracy and concentrated on the economic program of the triumph of the working class over their capitalist masters.

Though in the days of World War I, a number of plots of pro-German emissaries and associations were uncovered in the United States, the virus then did not spread, as it did during the decade 1937-46, to thousands of U.S. citizens. The term "fifth column" originated in the Spanish Civil War of 1936-39 to denote a regiment in Madrid which was to come to the support of the rebel general's attack on the city. Thence the term was applied to any group of agents of a foreign country working under cover to undermine the civilian morale and patriotism of their fellow citizens. It was through his fifth column of nazi propagandists that Hitler "softened up" the countries which he was about to overrun with his armies. Investigators exposed with sizable documentation the alarming extent of the activities of the fascist and communist fifth column in the U.S., especially the efforts of these subversive groups to capture the allegiance of the often disillusioned returning veterans of the war. The leaders of these groups masqueraded as 100% patriots. They wrapped themselves in the U.S. flag. Their pamphlets and manifestoes carried the words "American," "Christian" and "Patriot" conspicuously on their pages. Yet they were filled with hatred and abuse of Jews, Catholics, Negroes, public officials and labour leaders. They hailed the revival of the Ku Klux Klans and appealed to the worst traits in human nature: undisciplined emotion, intolerance, class hatred, denunciation and deceit.

It was a critical hour for the fate of democracy all over the world. The United States, which had emerged from World War II as the most powerful champion of democracy, had a special responsibility for the preservation of government "of the people, by the people and for the people." Abraham Lincoln in his message to congress of July 4, 1861, declared that the struggle which the nation was then facing was "essentially a people's contest . . . to elevate the condition of men . . . to lift artificial weight from all shoulders." More than 80 years later, Winston Churchill acknowledged that the salvation of democracy depended chiefly upon the leadership of the United States. And Pope Pius XII in his allocution of Christmas Eve 1945 said: "God has entrusted to the hands of the American people the relief of suffering humanity." But the nation could not fulfil such solemn obligations to the world at

"The Opposition Views the Opposition." Crawford of the Newark Evening News caricatured the Republican party's claim that Roosevelt was too old to be president and the Democratic party's charge that Dewey was too young in 1944

large unless it preserved its birthright of freedom at home. (See also Communism; Democracy; Fascism; Liberalism.)

Latin-American Relations

The huge continental land mass from the Rio Grande to Cape Horn, with an area nearly three times that of the United States and a population nearly as large, had been too little known to the U.S. people. From the publication in 1823 of the Monroe Doctrine, which guaranteed the republics newly liberated from Spanish rule against interference by European powers, down to the announcement of the "good neighbour" policy by President Roosevelt 110 years later, Latin America (except for Mexico and Cuba) had occupied the attention of the U.S. government only on rare occasions. Its commercial, and especially its cultural ties were with the nations of western Europe. Few U.S. citizens read the history, spoke the language or visited the countries of the sister republics to the south. These republics generally regarded the government at Washington with a not unjustified suspicion of "Yankee imperialism," disguised as benevolent protection, while the U.S. people allowed their contempt for the political instability of the Latin-American states to obscure the appreciation of their remarkable cultural achievements.

Beginning with a meeting of 19 of the American republics at Washington, D.C., in Oct. 1889, called by President Benjamin Harrison's secretary of state, James G. Blaine, Pan-American conferences were held from time to time: at Mexico City (1901, when the Bureau of American Republics was established), Rio de Janeiro (1906), Buenos Aires (1910). These conferences were occupied with economic questions such as trade, currency, copyrights and reciprocity pacts. It was not until World War I had raised the problem of hemispheric defense that emphasis in the conferences was laid on the political and military relations of the republics to the United States and to one another. President Calvin Coolidge went to Havana to open the sixth conference in Jan. 1928, and the chairman, former Secretary of State Charles E. Hughes, declared: "We have no policy of aggression. Nothing could be happier for the United States than that all the countries in the region of the Caribbean should be strong and self-sufficient, settling their problems with peace at home and the fulfilment of their obligations abroad." President-elect Herbert Hoover,

in November of the same year, made a good-will tour of a dozen of the South American countries.

Good Neighbour Policy.-The cultivation of a genuine Pan-Americanism, in which the "Colossus of the North" should abandon any attempt to dominate the policies of the southern republics, was the aim of the "good neighbour" policy announced by President Roosevelt in his inaugural address of March 4, 1933. During the Tast administration, some coercive measures had been taken to protect U.S. investments in Latin America ("dollar diplomacy"), and in Wilson's day U.S. marines were stationed in Puerto Rico, Haiti and Nıcaragua, dıctating policies and supervising elections. Now, in implementation of the good neighbour policy, the last of the marines were withdrawn, the Platt amendment (giving the U.S. the right to intervene in Cuban affairs) was abrogated in 1934, and at the seventh Pan-American conference in Montevideo, Uruguay, under the chairmanship of Secretary of State Cordell Hull, the ties between the American republics were strengthened.

It was the eighth conference at Lima, Peru, in the closing days of 1938 that marked the greatest advance in hemispheric solidarity. The Latin-American countries had been inclined to look to the League of Nations for the orientation of their policy, and several of their statesmen had held high positions in the League. But with the evident failure of the League to halt the aggressions of Mussolini, Hitler and the Japanese war lords, the Latin-American states one after another withdrew from the League and sought closer co-operation with the United States. At Lima, a declaration was signed by all of the 21 republics which was virtually an American League of Nations. They agreed not only to reduce trade barriers and to improve the machinery for preserving peace among themselves, but, most important of all, they pledged themselves in case of threatened aggression by a foreign power to meet and consult for common protection. The Declaration of Lima paid good dividends when the European war broke out the next year. Conferences at Panamá (1939), Havana (1940) and Rio (1942) emphasized Pan-American solidarity and promised united action to oppose aggression against any of the republics. Brazil, Argentina and Uruguay forbade belligerent operations in waters within 300 mi. of their shores and pooled their navies to patrol the 6,000 mi. of coast from the mouth of the Amazon river to Cape Horn.

The Caribbean republics declared war on Hitler at once after the Japanese attack on Pearl Harbor. Mexico and Brazil followed in Aug. 1942, and Colombia and Bolivia the next year. Eleven of the republics received military and naval missions from the United States, and several of them put their naval and aviation bases at the disposal of that country. Some 500 Latin-Americans travelled to the U.S. for aviator training. A landmark in the development of Pan-American solidarity was the Inter-American Conference on Problems of War and Peace which met at Mexico City on Feb. 21, 1945. The Act of Chapultepec which resulted from this conference provided for quadrennial meetings of the American states, for a permanent economic and social council, and for the integration of the inter-American organization into the framework of the United Nations charter, which was to be drafted at San Francisco the following April. It further provided that a board draft a scheme for the closer political, economic and social co-operation of the states, to be submitted to the ninth Pan-American conference at its meeting at Bogotá (Colombia) in 1947.

U.S. relations with Mexico were far from satisfactory at

the beginning of the decade 1937-46. In March 1938, President Lázaro Cárdenas announced that the state would seize the oil properties of the British and U.S. companies, which were valued by the companies at \$450,000,000. Though compensation was promised, not a penny was paid for the \$25,000,000 worth of land confiscated from the U.S. owners. Great Britain broke off relations with Mexico; but Secretary Hull, hopeful of avoiding discord at the coming Lima conference, pursued a waiting policy. On Dec. 2 the Mexican supreme court upheld the expropriations by a unanimous vote and denied the companies the right to compensation for concessions granted in former years. But this intransigent policy resulted only in injury to Mexico itself. U.S. importers, as well as some Europeans, boycotted Mexican oil while a Hull trade agreement with Venezuela, reducing by 50% the duty on certain quotas of foreign oil imported into the United States, cut still further into the Mexican business. In the year following the expropriations, Mexican foreign trade fell off 40% and imports, 60% of which were normally from the United States, declined by \$60,000,000. It was evident that Mexico lacked the managerial talent to run the oil properties successfully. When General Manuel Avila Camacho succeeded Cárdenas as president in 1940, a settlement was reached in which Mexico agreed to pay \$37,-000,000 for the expropriated lands and the United States agreed to purchase \$25,000,000 of Mexican silver a year. The hearty co-operation of Mexico in the war against the axis served to dispel the ill feeling which had existed for more than a score of years between the two nations.

Sore Spot.—It was with Argentina that U.S. relations were especially strained. That republic was the richest and most powerful of the Latin-American states; it had a larger proportion of whites than did the United States. Its great capital of Buenos Aires, with nearly 2,500,000 persons, was second in size only to New York and Chicago in the Western hemisphere. Its railroad mileage was 43% of the total in South America.

There were two main causes of friction between the United States and Argentina: one economic and the other political. First, Argentina's livestock, meat and cereals, which comprised about nine-tenths of its exports, competed with the products of the United States, as the coffee and rubber of Brazil and the tin of Bolivia did not. This meant that its exports to the U.S. fell below those to Great Britain, which needed Argentina's grain and meat; and that its demand for U.S. oil, machines, electrical equipment and factory products generally created for this nation an unfavourable balance of trade which was an embarrassment for its finances. Furthermore, the situation was made worse when in 1927 the U.S. banned the entrance of Argentine meat into the United States on the ground of the prevalence of the hoof and mouth disease among its cattle.

The economic friction was relieved to some extent when World War II threatened to dislocate Argentina's trade with Europe and emphasized the necessity for the solidarity of the western hemisphere. A reciprocal trade agreement with Argentina in Oct. 1941 cut by roughly 50% the tariff duties on 84 articles which comprised over 90% of Argentine exports to the United States, while Argentina reduced by 25% to 50% its duties on a variety of imports from the U.S. In 1942 the discrimination against Argentine meat was removed.

Then occurred the second and more serious check to the desired good relations with Argentina. Though the mass of its people and the majority of its national assembly were well disposed to the democratic ideals of the United

Nations, its high officials, with a few conspicuous exceptions, sympathized with the axis. The Argentine army, which exercised an enormous political influence, was shot through and through with fascist propaganda. Fifth columnists were ceaselessly at work among the 250,000 Argentines of German nationality. The German embassy spent more than 30 times as much money in 1941 as in 1938 in subsidizing Argentine newspapers and paying nazi agents. Already at the Lima conference of 1938 the Argentine delegates showed their reluctance to adopt any resolutions offensive to the totalitarian powers. Argentina declared its neutrality in 1940 and refused to seize the ships of the axis.

At the same time, Argentina pursued a vacillating policy, not wishing to break with the United Nations. In fact, President Ramon Castillo on Dec. 31, 1941, formally declared the "solidarity" of his country with the United States. But actions spoke louder than words. On June 3, 1943, a military coup d'état overthrew the government of President Castillo, and out of the revolutionary turmoil which followed, Juan D. Perón emerged as a fascist dictator: the Franco of Argentina. The United States did not recognize the regime of "the colonels" and denied lendlease assistance to it. Secretary Hull scored the country as the "focus of fascism" in the western hemisphere, and President Roosevelt denounced the rule of the colonels. U.S. Ambassador Norman Armour was recalled in June 1944.

Though the Argentine government had, for the sake of conciliating the democracies, broken with the axis in Jan. 1944, the coup of the army the next month frustrated any possibility that the country would co-operate faithfully in the United Nations' program. German agents were still allowed to work under cover. Liberal newspapers were suppressed. Democratic rallies were dispersed. Argentina was not invited to the Inter-American conference at Mexico City in Feb. 1945, but it was decided that if it would sign the Act of Chapultepec, would declare war on the axis, and would adhere to the United Nations pact, it might be readmitted to the community of American states. Eager to participate in the conference of the United Nations scheduled to meet at San Francisco in April, Argentina declared war on the axis on March 27, 1945, and on April 19 President Truman, after Argentina had signed the Act of Chapultepec, sent Spruille Braden as ambassador to Buenos Aires. Argentina thus won a seat at San Francisco; but Braden, during the five months that he remained in Buenos Aires, was highly critical of the good faith of the Perón regime.

Meanwhile, many forces were at work to strengthen the political, economic and cultural ties between the United States and Latin America. Reciprocal trade agreements were negotiated with half the republics. Loans were extended to Argentina, Brazil, Chile, Peru, Bolivia, Cuba and Nicaragua. In May 1942, the Columbia Broadcasting system opened a net-work of 76 Latin-American stations. Nelson A. Rockefeller's Office of Inter-American Affairs (q.v.) encouraged a better mutual understanding of the history and civilization of the various countries. Some 8,200 mi. of the 11,500 mile highway from New York to Buenos Aires were completed in 1940. In the summer of the same year U.S. students were registered at the universities of Bogotá, Santiago and San Marco, Peru (the oldest university on the western continent), and more than 1,000 South American students were enrolled at 158 universities and colleges in the United States. Delegations of business

men, professors, lawyers, doctors and scientists travelled from Latin America to study U.S. institutions. A genuine Pan-Americanism was rapidly supplanting the spirit of dominating patronage which had too often in the past characterized the attitude of the "Colossus of the North" toward the Latin-American countries (see also Pan-American Conferences, 1937–46).

Foreign Policy

Disturbing events in Europe and Asia in the years immediately preceding the eventful decade—Mussolini's unprovoked attack on Ethiopia (1935), Hitler's armed occupation of the Rhineland (1936) and the outbreak of the Spanish civil war (1936)—turned the attention of the administration at Washington to the possible danger of these aggressive moves to the nation's own security. President Roosevelt's speech at Chicago on Oct. 5, 1937, sounded the note of the responsibility for checking the epidemic of aggression which was spreading in the totalitarian countries.

While a large part of the U.S. people, nurtured on the traditional policy of nonintervention and not yet grasping the fact that Hitler's aim was world conquest, believed that the Neutrality act of 1937 guaranteed immunity from the contagion of war, the president and other high officials responsible for U.S. foreign policy were convinced that the nation had to exert all possible influence to halt the march of the aggressors, and take positive measures of preparedness for national defense.

As the nazis proceeded, in spite of the Munich pact, to extinguish the republic of Czechoslovakia (1939) and overrun Poland, President Roosevelt interceded no less than three times with personal messages to Hitler, Mussolini, the president of Poland and the king of Italy, pleading with them to settle their differences peaceably, and offering Hitler the pledge of 31 listed nations to refrain from attacks against him. But all that the president got for his pains was either contemptuous silence or rude rebuke from the two totalitarian despots.

Toward War.—After Hitler's crushing defeat of Poland, Roosevelt called congress in extra session on Sept. 21, 1939, and secured the repeal of the embargo provisions of the Neutrality act by substantial majorities in both houses. And when the nazi hordes were launched against western Europe in the spring of 1940, rapidly subduing Denmark, Norway, the Netherlands, Belgium and France, and leaving Great Britain alone to withstand the savage assaults of Goering's luftwaffe, the president abandoned persuasion for prompt action. The U.S. must come to the support of the democracies. Its factories must be converted as rapidly as possible to war production.

Its army and navy must be expanded to meet all possible contingencies.

The 76th congress responded with enormous appropriations. On May 28, 1940, a Council of National Defense was set up and the next month, a Selective Training and Service bill was introduced in the house, and signed by the president on Sept. 16. (See above.)

The nation was only technically at peace in the autumn of 1940. Actually, it was already a partner of Great Britain, as was shown by Roosevelt's transfer to that power of 50 U.S. destroyers in exchange for leases of naval bases along the Atlantic coast. The Lend-Lease bill of the following March swept away the last pretense of neutrality, although it was not until Nov. 1941 that the provisions forbidding the arming of merchant vessels and their entrance into combat zones were repealed.

The legal fiction of neutrality was contradicted by event after event in 1941: by the closing of the nazi consulates in June, the deportation of 450 axis agents in July, the president's order to "shoot at sight" on German submarines in September. After Pearl Harbor, Prime Minister Winston Churchill spent the Christmas holidays in Washington and received an ovation when he addressed congress on Dec. 26, celebrating the solidarity between his country and the United States. He and President Roosevelt had met on a war vessel off the Newfoundland coast the previous August and drawn up the Atlantic charter (q.v.), parent document of the international association for the maintenance of world peace.

On New Year's day, 1942, the representatives of 26 nations (increased to 55 by the end of 1946) adhered to the principles of the Atlantic charter, and the United Nations was born.

U.S. relations with Japan had been growing more critical from year to year as it became evident that the military clique in Tokyo was determined to subjugate China, whatever the western powers might say or do. The doctrine of the "open door" was repudiated, and the Nine Power treaty of 1922 and the Kellogg pact of 1928 (both of which Japan had signed) were denounced. In retaliation, the United States terminated in Jan. 1940 the commercial treaty with Japan in effect since 1911.

Still, the United States was Japan's largest customer, buying 70% of its chief export commodity of raw silk. U.S. foreign trade with Japan was more than three times that with China, and the nation continued to send Japan oil, scrap iron and other materials needed in building its war industries.

When the treacherous attack on Pearl Harbor on Dec. 7, 1941, put an end to the insincere protests of friendship for the United States, congress on the next day declared war on Japan, and five days later on its axis partners, Germany and Italy. For the campaigns of the global war, in which U.S. officers, soldiers, sailors, marines and airmen distinguished themselves on a score of fighting fronts, see WORLD WAR II.

U.S. foreign policy during the war could be summed up in a single phrase: all-out endeavour, without regard to party or economic interest, to send the axis down to utter defeat.

In World War I only a few men, with President Wilson in the lead, had concerned themselves with the kind of peace that should follow. The "Big Four" (Wilson, Georges Clemenceau, Lloyd George and Vittorio Orlando) who were the architects of the Treaty of Versailles had never met until they came together at the peace table. But in the later war, frequent conferences were held, not only for the discussion of the conduct of military operations but to formulate plans for the building of a better world when the conflict should be over. The U.S. and British staffs were combined. Roosevelt and Churchill met for conferences no less than six times, in the U.S. or Canada or Africa, between Aug. 1941 and Aug. 1943.

At the end of October of the latter year Secretary Hull flew to Moscow to meet the foreign ministers of Great Britain (Anthony Eden) and Russia (Vyacheslav Molotov). The declaration which they drew up advocated the establishment "at the earliest practicable date" of "a general international organization . . . for the maintenance of international peace and security." The United States senate endorsed the proposition on Nov. 5 by a vote of 85 to 5.

Late in the same month, Roosevelt, Churchill and Chiang Kai-shek met at Cairo and agreed that Japan should be stripped of all the islands in the Pacific which it had seized and should restore all the land that it had stolen from China. From Cairo, Roosevelt and Churchill flew on to Tehran (Iran) to meet Marshal Stalin and pledge their three countries to co-operate fully in the destruction of the German army, fleet and air power, and the conclusion of a peace which should "command good will from the overwhelming masses of the world and banish the scourge and terror of war for many generations." In Feb. 1945, when the doom of Germany was practically assured, the same men held a conference at Yalta in the Crimea, where they adopted resolutions for the occupation and control of Germany, the restoration of free governments in Poland and the liberated Balkan countries. the periodic meetings of foreign ministers, and the calling of a conference at San Francisco on April 25 to draft a charter for the United Nations.

On his return from Yalta, President Roosevelt addressed the nation (March 1), reporting on the close accord of the conference and declaring that "this time we are not making the mistake of waiting until the end of the war to set up the machinery of peace." The president, worn out by his incessant labours, died 13 days before the delegates from 50 nations assembled at San Francisco. (See also International Conferences, Allied [World War II].)

World Responsibility.—In two months at San Francisco, the delegates completed an elaborate charter, based on the outline proposed at Dumbarton Oaks six months before, and President Truman went to San Francisco to close the final session on June 26. A month later the U.S. senate ratified the charter by a vote of 89 to 2. And on Oct. 24, a majority of the nations having adhered to the charter, Secre-

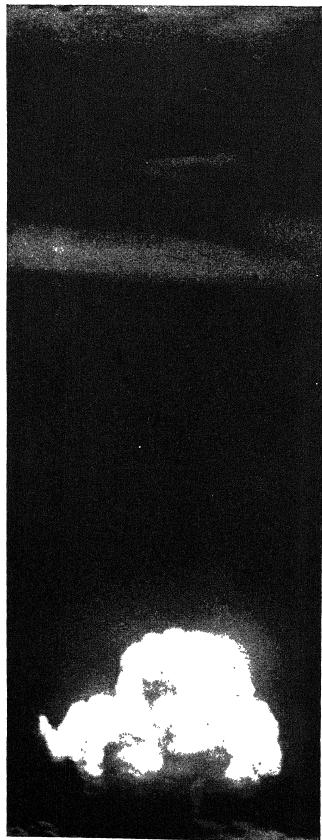

tary James F. Byrnes announced that it had the force of law. For the first meeting of the general assembly of the United Nations, convened at London on Jan. 10, 1946, the U.S. delegation appointed by President Truman consisted of Secretary of State Byrnes, former Secretary Edward Stettinius, Senator Tom Connally of Texas (chairman of the senate foreign relations committee), Senator Arthur Vandenberg of Michigan, and Mrs. Franklin D. Roosevelt. The second eight-weeks meeting at Flushing Meadows, Long Island, ended on Dec. 16, 1946, and left to the 11member Security council at Lake Success the task of completing a program for the reduction of the armed forces of the world and controlling the production and use of atomic energy. The main results of the prodigious labour of the assembly were: agreement on the principles of disarmament and the outlawing of the atomic bomb, establishment of a ten-nation Trusteeship council for the administration of the former League of Nations mandates, recommendation that the U.N. members recall their ambassadors and ministers from Spain until Franco was driven from power, adoption of a site on the east side of Manhattan, presented by John D. Rockefeller, for the capital of the United Nations, recommendation of the sparing use of the veto power by the Big Five, plans for the continuation of famine relief on the expiration of U.N.R.R.A., adoption of a budget of \$47,130,000 for expenses in the succeeding year, enlargement of the Security council and the Economic and Social council, and the admission of five new states to the U.N., bringing the total membership up to 56.

(See also United Nations.)

The president and the state department incurred a vast

Test explosion of the first atomic bomb in history. Detonation took place at Alamogordo, N.M., on July 16, 1945

amount of criticism during the decade for their handling of several delicate and difficult problems of diplomacy as

well as for the use of the atomic bomb to end World War II. The failure to insist on sanctions against Mussolini in his aggression on Ethiopia was disapproved by many as a dereliction of duty to promote the restraint of international brigandage above the profits from the sale of oil and munitions. The administration was criticized for sending Admiral William Leahy as ambassador to Vichy, thereby virtually recognizing the puppet regime of Henri Pétain and Pierre Laval. The acceptance by Roosevelt of Admiral Jean Darlan, a determined fascist foe of the democracies and a partisan of Pétain, as French chief of state in North Africa was justified by the administration at Washington as a necessary "temporary expedient" (in view of Darlan's apparent conversion to the side of the Allies) for preventing military resistance by the French to the U.S. campaign through Morocco, Algeria and Tunisia. But U.S. indignation against the employment of such a questionable "ally" was outspoken, and the assassination of Darlan by a young Frenchman on Christmas Eve of 1942 removed a leader who might well have proved a hindrance rather than a help to Allied occupation of North Africa.

Sumner Welles, former under secretary of state, in his book Where Are We Heading? (1946), excoriated the administration at Washington for its ignorant and bungling policy in Latin America, especially Argentina, which, he said, bid to frustrate all the gains of the "good neighbour" program of President Roosevelt.

In China, according to many critics, the United States had lamentably failed to formulate a policy to bring order out of chaos. The fundamental mistake, critics declared, had been U.S. assumption of the role of partisan instead of mediator, supporting Chiang Kai-shek (albeit ineffectually) in his intransigent attitude toward the communists of the north, with the result that neither the boisterous Patrick Hurley nor the judicious General Marshall made any headway in bringing to an end the civil war which increased in violence after the defeat of Japan. It had long been a reproach voiced against the U.S. government that it had no consistent foreign policy.

The charge may have been true. But in mitigation of the charge it had to be borne in mind that it was only during World War II that the nation had renounced its traditional refuge from world responsibility, and now found the burden of such responsibility all the greater because of the leading part which U.S. wealth and power were destined to play in the building of a new world of peace and security.

The time had come for fulfilment of the prophetic words of Theodore Roosevelt nearly half a century before:

"The question is not whether America shall play a great part in the affairs of the world, but whether she shall play it well or ill."

Uranium

After the announcement of the explosion of the first atomic bomb over Hiroshima on Aug. 6, 1945, uranium filled more newspaper headlines than had ever been the lot of any other metal.

Even at the end of 1946, however, security reasons still prevented the publication of anything more than basic fundamentals relating to the metal.

For many years uranium had been recognized as a standard colouring agent in ceramics, as a useful ingredient in certain photographic processes, as a catalyst in a few chemical reactions, and in a few other minor uses. Plentiful supplies of the material were available as a by-product from vanadium and radium ores, and there was no incentive to search for ores of uranium.

In the 1930s, the unstable isotope U-235 was discovered to accompany the normal variety in the proportion of 1 to 140, but though the problem of isolating U-235 and making use of its peculiar properties received much attention as a scientific problem, it was not seriously attempted as a practical problem on a practical scale until 1942.

Starting out primarily as a problem of the separation of the scarce isotope U-235 from the plentiful variety U-238 in quantities of sufficient size to be of practical rather than of scientific value, there were a number of more or less startling developments.

Early in the research it was found that under neutron bombardment U-238 could be converted into the unstable isotope U-239, which in turn was transformed into a hitherto unknown element, No. 93, which was given the name neptunium.

Another step in the transformation converted the unstable neptunium into another new but more stable element, No. 94, called plutonium.

While plutonium is more stable than neptunium, it is still enough on the unstable side to be fissionable, like U-235, and since it is obtainable from the plentiful U-238, rather than from the scarce U-235, the discovery of this

procedure simplified the problem greatly. Later it was reported that the bombardment cycle also produced smaller amounts of two more new elements, Nos. 95 and 96. Still later it was announced that some 150 different isotopes of about 35 different elements had been identified in the byproducts of the chain reaction piles used for the production of plutonium.

Little information was made public concerning these isotopes, but sufficient amounts of some of them were collected to make it possible to use them in medical and biological experimentation.

Uranium played its part in World War II, and regardless of whether one agreed with the group that held this part to have been a major and decisive one, or with those who maintained it was unnecessary and unjustifiable, the fact remained that the two outstanding problems facing the postwar world were the legacy of uranium's role in the war.

The first of these problems was the necessity of adjusting international relations on such a basis as to preclude the possibility of the metal playing a major role in a third world war; the second problem, possibly even greater than the original one of creating the atomic bomb, was the adaptation of its destructive properties to peaceful pursuits, where they might be used for the benefit of mankind, rather than for its destruction.

468 Urology

Probably the most important advance in the field of urology during the decade 1937–46 was in chemotherapy. In no field of medicine were chemotherapeutic agents used to greater advantage than in the treatment of infections involving the genito-urinary tract.

Urinary Antisepsis.—Urinary antisepsis began with the use of the ketogenic diet as a bactericidal agent; then the discovery of mandelic acid presented the medical profession with the first specific therapeutic compound for the treatment of urinary infections. This was soon followed by the discovery of the sulfonamides and, later, the powerful antibiotics, penicillin and streptomycin.

When a patient who had infection in the urinary tract was placed on the ketogenic diet, the urine often became sterile. M. L. Rosenheim found subsequently that mandelic acid was the predominant factor in causing urinary antisepsis with ketosis. Mandelic acid, in conjunction with drugs given to acidify the urine to a pH of 5.5 or less, was found to be bactericidal to many gram-negative organisms, particularly of the colon bacillus group. Although uncomplicated bacillary infection of the urinary tract and infections caused by streptococcus faecalis, were frequently eliminated by this drug, it had no effect on other types of coccal or streptococcal infection. Unfortunately, however, mandelic acid often was not well tolerated and caused systemic reactions. Although it was largely replaced by the sulfonamides and antibiotic agents, nevertheless it was still employed in some cases. It was also used in combination with hexamethylenamine under the name of mandelamine, with good results in some cases.

Not long after the employment of mandelic acid in treatment of urinary infections, Gerhard Domagk discovered that the sulfonamides possess powerful bactericidal qualities. These drugs soon were applied to infection in the urinary tract with excellent results. A great variety of sulfonamide drugs was synthetized and replaced such early forms as sulfanilamide and sulfapyridine. Such drugs as sulfadiazine, sulfamerazine, sulfathiazole and sulfacetimide became generally employed. These newer sulfonamides caused fewer systemic reactions and permitted higher levels of the drug in the blood than the compounds first discovered. The sulfonamide drugs are easily administered and are advantageous in that they are bactericidal to both coccal and bacillary organisms. One of the disadvantages of the sulfonamide drugs is the systemic reaction which they sometimes cause. Some individuals are definitely allergic to sulfonamide drugs, and cases were reported in which one or another of the following complications appeared: profound toxaemia, extensive eruptions of the skin, fever, agranulocytosis, or haemolytic anaemia. Sulfonamides also may cause crystalluria with microscopic haematuria, and this complication should be searched for by routine urinalysis. Crystalluria is observed infrequently in the treatment of urinary infections because of the comparatively low dosage of sulfanilamide employed. It was found that alkalinization of the urine by administering sodium bicarbonate prevents crystallization in the kidneys. Sulfamerazine was advocated because a smaller dose is required to maintain effective levels in the blood than for other sulfonamide compounds, and it is excreted more slowly. It is imperative that careful medical supervision should be given in all cases in which sulfonamide compounds are administered.

Antibiotic agents, best represented by penicillin and

streptomycin, were proved particularly valuable in combating infections in the genito-urinary tract. Although the antibacterial action of penicillin was discovered by Alexander Fleming in 1929, it was not applied clinically until its therapeutic value was determined by H. W. Florey and his co-workers in 1940. Penicillin, which at first was produced in limited amounts, became available in large quantities and was widely applied. The generally accepted method of administration of penicillin for urinary infections was by means of intermittent intramuscular injections. A simpler method was adopted later-a single intramuscular injection of a preparation which combines penicillin with a solution of beeswax and peanut oil sustained a high level of penicillin in the blood for more than 24 hr. Oral administration of penicillin was tried with a variable degree of success. Although penicillin failed to eliminate urinary infection in many cases, it was often found valuable in controlling acute infections when other measures had failed. It also was proved of value in combating acute infection in the prostate gland, renal cortex and perinephric tissues and in controlling periurethral inflammation, such as sometimes occurs after transurethral manipulation.

In 1944, S. A. Waksman and his co-workers, in a search for a substance which would be bactericidal to organisms of all types, isolated a new antibacterial substance, streptomycin, which was obtained from the culture filtrate of actinomyces griseus. They found that this antibiotic had relatively low toxicity and exerted a definite antibacterial action on many gram-negative and some gram-positive organisms.

Although streptomycin was not as widely applicable as penicillin, nevertheless, it was found to be particularly valuable in the treatment of infections caused by certain gram-negative bacilli. It had almost a specific effect in combating proteus ammoniae, which formerly had been difficult to control. It was shown to have a distinctly deterrent action on the activity of myco-bacterium tuberculosis. In the few reported cases of renal tuberculosis in which it was administered, definite improvement was noted in symptoms and in the patient's general condition, and in some cases tubercle bacilli were eliminated temporarily from the urine. Streptomycin usually is administered parenterally because when given by mouth practically none of it is absorbed from the gastro-intestinal tract. After one parenteral injection a high percentage of the drug is excreted in the urine within 12 hours. In some cases it produced a moderate degree of toxicity, and a few patients complained of histamine-like reactions. It is best given in a dosage of 1 or 2 gm. daily by intramuscular injection, at intervals of three hours. It is necessary that the drug be given in large doses at the beginning if the desired effect is to be obtained. It should be emphasized that self-administration of these antibiotics is inadvisable. Careful supervision by a physician is essential to their successful employment.

Since these agents had specific action for various types of bacteria, a careful study of the bacteria involved was found to be fundamental to successful treatment. By dividing the bacteria into two groups—namely, gram-negative bacilli and gram-positive cocci—it was found that mandelic acid was effective against gram-negative bacilli only; the sulfonamide drugs against both gram-positive cocci and gram-negative bacilli; penicillin largely against gram-positive cocci, and streptomycin against selected gram-negative organisms and occasionally gram-positive cocci.

It was found that all these drugs eliminate bacteria from the urinary tract only in acute and subacute infections. In chronic infections, with extensive cicatricial changes in the renal parenchyma, the improvement usually is only temporary. Moreover, it should be repeated that no antibacterial medication can be efficacious without adequate surgical drainage, in the presence of retained urine, or in the presence of foreign bodies. In the treatment of infection in the urinary tract, the large dosage of these agents, indicated in the treatment of systemic infections, was not found necessary. This may be explained by the excretion of the agent in the urine, which permits it to come in direct contact with the infected tissue.

Treatment of Gonorrhoea.-Elimination of gonorrhoeal infection, which defied all previous efforts for centuries, was achieved during the decade. With the discovery of the sulfonamide drugs, it was soon found that they had a bactericidal effect on the gonococcus, and their administration was followed by rapid elimination of this infection in from 50% to 70% of cases. By this treatment the various complications resulting from gonorrhoeal infection so often observed in former years were prevented or speedily controlled. The sulfonamide compounds, however, frequently were administered inadequately, both in dosage and in the length of time during which the drug was employed. Although the infection often was apparently eliminated, evidence of the disease reappeared later and one or two subsequent courses of sulfonamide therapy were necessary to eradicate the infection. It soon became apparent that some strains of gonococci were resistant to the sulfonamide drugs and they were ineffective against these strains.

With the advent of penicillin, it was found that this antibiotic agent was even more efficient in eliminating gonorrhoeal infection than the sulfonamides were. In fact, it was found that penicillin would overcome gonorrhoeal infection in almost 98% of cases if given in adequate dosage. It is usually administered by subcutaneous injection at intervals of three hours. The total dosage for 24 hours is from 100,000 to 150,000 units. In 1945-46 it was demonstrated that when penicillin was injected in a solution of peanut oil and beeswax, it was absorbed continuously for from 8 to 10 hours. In most cases a single injection of from 100,000 to 200,000 units sufficed to eliminate the infection. Penicillin, therefore, largely replaced the sulfonamides in the treatment of gonorrhoea. It was particularly efficient in overcoming infections resistant to the sulfonamides. A combination of the sulfonamides with penicillin was reported to be of value in some infections which had been resistant to either drug when used alone. In the treatment of this disease adequate dosage and subsequent re-examination after the urethral discharge ceases are of primary importance. It is essential that the treatment is carried out under the guidance of a physician.

Urinary Calculi.—Although the factors fundamental to formation of calculi in the urinary tract were not determined, important pathologic and bacteriologic studies offering possible clues were reported during the decade. Attention was called to the frequent occurrence of milk patches in the renal papillae which in some cases seem to form a nucleus for the development of calculi. The importance of infection in the formation of some calculi was definitely established in cases in which urea-splitting organisms, such as staphylococcus and proteus, are present. Increased emphasis was placed on the role of calcium metabolism in the pathogenesis of stones in the urinary tract. Quantitative estimation of calcium excreted in the urine was shown to be of diagnostic and therapeutic value. Calcium metabolism was found to be greatly affected by pathologic changes in the parathyroid gland. The presence of such lesions usually cannot be determined by physical examination but can be detected by increase in the levels of calcium and phosphatase, together with decrease in phosphate in the blood. Increase in the amount of calcium in the urine, as indicated by the Sulkowitch test, proved to be a valuable diagnostic aid in recognizing parathyroid disease. Parathyroid tumour was discovered to be the aetiologic factor in cases in which renal stones had formed repeatedly, and surgical removal of the tumour was followed by cessation of formation of stones.

The dissolution of calculi in the urinary tract by the continuous application of chemical solutions was attempted, without signal success. Later, a buffered solution of citric acid was used for this purpose. When applied to renal calculi through ureteral catheters or nephrostomy tubes, it proved successful in only occasional cases of soft, recently formed stones. The solution can be used only intermittently, since it is capable of causing renal irritation. In incrusted cystitis, however, it was found useful in dissolving calcified deposits. Dietary regimens proved to be efficacious in preventing recurrence of stones only in selected cases. Reduction in intake of calcium and acidification of the urine by means of a high acid, ash diet were of value in preventing the formation of phosphatic stones in some cases.

Hormonal Therapy.—Hormonal therapy was widely employed during the decade in the treatment of various lesions of the genito-urinary tract. Although an anterior pituitary-like substance with gonad-stimulating action was successful in occasional cases in the treatment of undescended testes when employed prior to the age of puberty, in most cases mechanical impediment by surrounding tissues prevented complete descent. Use of gonadotropic or androgenic hormones was accompanied by disagreeable complications in immature patients. The female sex hormone, estrone, proved to be of value as an adjunct in the treatment of vulvovaginitis in children.

The use of female hormones in the treatment of benign prostatic hypertrophy was the subject of widespread clinical investigation. Although some observers reported reduction in size of the enlarged prostate gland, together with reduction in symptoms of urinary obstruction in some cases after administration of estrogenic substances, such treatment was not followed by permanent improvement. The deformity at the vesical neck caused by prostatic hyperplasia usually remained in spite of some reduction in the volume of the gland.

The discovery of the relation of the sex glands to the development of carcinoma in the prostate gland and its biochemical relations proved to be an advance of tremendous importance. It was found that when androgens were administered, hyperplasia of the carcinomatous tissue occurred. Elimination of the testicular source of androgen by orchectomy, or control by estrogenic drugs, caused definite regression in the size and consistency of the prostate gland, cessation of pain caused by metastasis and improvement in the patient's general condition. It was found that in the presence of carcinoma of the prostate gland, the level of acid phosphatase in the serum was elevated to a variable degree. In the presence of osseous metastasis, the value for alkaline serum phosphatase also was elevated to a degree corresponding to the extent of metastasis. With the control of androgenic sources, the concentration of serum phosphatase was reduced in most cases and often returned to normal. Although the carcinomatous prostate gland decreased in size, the mechanical obstruction at the neck of

the bladder usually persisted, and operative removal of the obstructing tissue, preferably by transurethral procedures, was required.

Transurethral Resection.—During the decade, transurethral resection of tissues causing obstruction at the neck of the bladder was widely employed and became firmly established as the operation of choice in most cases. With improvement in technique of transurethral resection and with better methods of controlling haemorrhage and other complications, the operative mortality was reduced to a remarkably low figure, and the postoperative functional complications were largely overcome by experienced urologic surgeons.

In a group of patients who had retention of urine caused by lesions in the spinal cord, the function of the bladder was restored in dramatic fashion by transurethral resection. Many of these unfortunate victims of spinal disease or injury, in addition to paralysis of the extremities, were unable to urinate and were burdened with drainage tubes and usually had secondary infection in the urinary tract. Cystoscopic examination revealed obstruction at the neck of the bladder. This obstruction apparently was caused by a spastic condition of the edges of the detrusor muscles, resulting in contracture with rigidity of the tissues at the neck of the bladder. Although the commissural tissues were most involved, it was found necessary to remove tissue from all segments at the outlet of the bladder. As a result of this operation, the bladder would empty in most cases with the aid of pressure by the abdominal muscles and the diaphragm. The relief was striking in most cases. The value of the operation was demonstrated in many cases of injuries to the spinal cord among sailors and soldiers during World War II. Many, with the aid of orthopaedic and rehabilitation measures, were transformed from hopeless cripples to self-supporting citizens.

Radical Prostatectomy.-Carcinoma in any part of the body has offered the best opportunity for cure when discovered early. In spite of the technical difficulties involved, an attempt to remove localized early carcinoma of the prostate gland received greater recognition during the decade. The operation is a radical prostatectomy through a perineal approach, with excision of the seminal vesicles. A large factor in the success of this operation is the selection of early cases in which there is no periprostatic extension. Such clinical selection, however, was difficult and was largely limited to those cases in which a small nodule in the prostate gland had been discovered accidentally in the course of routine rectal palpation. It was found applicable in less than 5% of the cases of prostatic carcinoma encountered at clinical examination. As the result of refinements in operative technique, complications such as urinary incontinence and urethro-rectal fistula were largely overcome by the surgeon experienced in this operation.

Carcinoma of the Bladder.—Treatment of carcinoma of the bladder, a most difficult problem, tended to become more radical during the decade. From the therapeutic standpoint, tumours of the bladder were divided into discrete papillary tumours of low grade of malignancy and the infiltrating type of carcinoma. In the treatment of the former type, the best procedure was found to be electrocoagulation by transurethral methods. A systematic follow-up plan by means of which the patient was urged to return for cystoscopic inspection was of great value in eliminating early recurrence. Implantation of radium and roentgen therapy were not used so widely as in former years. For the infiltrating type of carcinoma, the treatment tended to

become more radical and the operation was improved. In the first place, it was found that preparation of the bowel prior to transplantation of the ureters was followed by definite improvement in operative results. This preliminary treatment included hospitalization, restricted diet and employment of intestinal antiseptics, such as succinylsulfathiazole, for four or five days; and it apparently reduced the virulence of the bacterial flora in the field of operation.

Advances in operative technique included the simultaneous intraperitoneal transplantation of the uncters into the sigmoid, together with cystectomy, prostatectomy and vesiculectomy, all at the same operation. This new operation shortened the convalescence and, in the hands of an experienced surgeon, was followed by comparatively low mortality rate. The complications which caused the most trouble were postoperative. In spite of precautions, constriction of the lower part of the ureter, with retention of urine and development of pyelo-ureterectasis, occurred in a considerable number of cases. The low operative mortality rate and the frequent excellent results, however, made this procedure worthy of consideration in every case of infiltrating carcinoma of the bladder. Uruguay

A republic in the southeastern part of South America, Uruguay is bounded by the Atlantic on the east, the Río de la Plata on the south, Argentina on the west and Brazil on the north. Area 72,172 sq.mi. (the smallest of any South American republic); pop. (1944 est.) 2,235,000. No census had been taken since 1908; official population estimates included the following: 1938, 2,122,628; 1939, 2,147,000; 1940, 2,164,000; 1942, 2,185,626; 1943, 2,202,936. Ninetenths of the population was of European ancestry; mestizos constituted most of the remainder. There was a large number of foreign-born inhabitants, most of them Italians and Spaniards, with smaller numbers of Brazilian, Argentine and French birth. The population density for the entire country was officially estimated in 1941 to be 30.28 per sq.mi., varying from 12.69 in the department of Artigas to 2,095.83 in the department of Montevideo, although the only other department with a density of more than 100 per sq.mi. was Canelones, with 108.57. The capital and chief port is Montevideo (pop., 1945 est., 747,665); other important cities (with 1945 pop. estimates unless otherwise stated) are Paysandú (50,000), Salto (48,000), Mercedes (33,000), Minas (1942 est., 32,000), Tucuarembó (30,000), San José (1942 est., 30,000), Rocha (28,500), Melo (28,000), Durazno (1942 est., 27,000); Santa Lucía (1942 est., 27,000).

The constitution of 1934 provided for a centralized republic composed of 19 departments, a bicameral congress with a senate of 30 and a chamber of deputies of 99 members. Presidents during the decade 1937–46 were Gabriel Terra, to June 19, 1938; Alfredo Baldomir, June 19, 1938–March 1, 1943; Juan José Amézaga, after the latter date.

Democracy for Dictatorship.-Pres. Gabriel Terra, who had been elected in 1931 on a platform of support for the constitutional system of 1919, found himself at odds in March 1933 with the national administrative council and the congress, and forcibly dissolved both bodies after a coup d'état. He thereafter ruled as a virtual dictator, although both the country and the government in the closing years of the administration manifested a desire to return to more democratic practices. Pres. Terra declared his intention of permitting free elections in 1938. The principal candidates in the campaign culminating in the election of March 27, 1938, were Gen. Alfredo Baldomir, a brother-in-law of Pres. Terra, and Dr. Blanco Acevedo, the president's son-in-law. Despite the relationships, the election was vigorously contested and was generally conceded to be fairly conducted. Gen. Baldomir had campaigned on a platform of anti-fascism, which proved popular in Uruguay's traditionally democratic atmosphere, and in the three-way contest he received 37% of the popular vote; he was inaugurated June 19. Pres. Baldomir in October joined in inter-American efforts to mediate the Ecuador-Peru boundary controversy.

Student demonstration in Montevideo on June 6, 1941, against a pro-axis newspaper

Uruguayan national prosperity remained largely dependent on competitive world markets, inasmuch as meat products normally provided about 95% of the exports, and in 1938 the country was adversely affected by the world economic recession and price decline of 1937, accentuated by bad weather conditions which reduced production. The government consequently directed its policy toward stabilization of markets through restriction of imports to products of countries buying from Uruguay. An arrangement was made with Mexico for the purchase of all Uruguayan oil needs for 1939, with 30% of the price to be covered by Uruguayan goods. The government late in December announced conclusion of a barter agreement with Italy, exchanging wheat for armaments, following the return of former Pres. Terra from a visit to Italy. Violent foreign criticism resulted from the announcement, coming as it did immediately after the Lima conference declaration, subscribed to by Uruguay, against such agreements.

The outbreak of war in Europe in Sept. 1939 had a generally, although not entirely, favourable effect, especially in the increased sale of livestock products. The government imposed a 25% tax on wartime profits of the pastoral industry in order to provide subsidies for adversely affected industries. Wool sales increased in the meantime, and in November the British government purchased £862,938 of Uruguayan beef.

Uruguay participated in the first inter-American foreign ministers' conference at Panamá in September-October, and was a leader in the expulsion of the soviet union from the League of Nations in December. One of the most dramatic developments of World War II occurred when on Dec. 13, 1939, the German pocket battleship "Admiral Graf Spee" engaged in a running battle with three British cruisers off the Uruguayan coast and, after being crippled

by gunfire, fied to Montevideo for refuge. The government rejected German demands for time for repairs and ordered the "Spee's" internment unless the ship departed by Dec. 17. As the British warships were still lying in wait off the port, the crew of the "Spee" scuttled the battleship soon after leaving the harbour and within sight of the city. The government on Dec. 30 gave the German merchant vessel "Tacoma," an auxiliary ship to the "Spee," 48 hours to leave port or be interned, and did intern the vessel on Jan. 1, 1940.

War Complications.—Uruguay was torn throughout 1940 by issues arising from the European war. Serious difficulties were experienced at the beginning of the year in handling the interned German sailors from the "Tacoma." Pres. Baldomir as early as February made strenuous efforts to advance Uruguayan defenses, but a proposal for compulsory military service was rejected by an apathetic congress. The revelation in June 1940 of widespread fifth-column activities and a pro-nazi plot to overthrow the government and convert Uruguay into an agricultural colony of Germany aroused great excitement, which was calmed only by Brazilian loan of arms and munitions, the calculated arrival of two United States cruisers, and formal pledges by U.S. Minister Edwin C. Wilson on June 23 of United States aid in suppressing any attempt to overthrow the government. Following these developments, conscription was enacted into law without serious opposition. The revelations of June lent colour to the charges earlier made by Prof. Hugo Fernández Artucio in a sensational book, Nazis en el Uruguay, that widespread German activity existed in the republic.

The chief issue late in the year was the proposed granting to the United States of naval base rights at Punta del Este, on the Atlantic coast, as part of the hemisphere defense program. Pres. Baldomir pushed the project in the face of strong Argentine protests, based on the fear that the Plata river could thus effectively be closed, and of bitter opposition within his own cabinet, some of whose members resigned. The congressional opposition, led by Dr. Luis Alberto Herrera, also vigorously opposed the proposal. Foreign Minister Alberto Guani, an ardent democrat, announced on Dec. 14, after several days of conference at Colonia with the Argentine foreign minister, the conclusion of an Argentine-Uruguayan agreement for the joint defense of the Plata river against possible non-American aggression.

Various cabinet and congressional crises occurred during 1941, usually originating in the peculiar constitutional provisions giving the minority party (the Blancos, led by Herrera) one-third of the cabinet posts and one-half of the senate seats. Pres. Baldomir actively supported constitutional amendment to correct this situation. Herrera, well known for his opposition to the United States, steadily opposed the administration's foreign policy, the central feature of which was hemispheric co-operation. Baldomir as early as June 9 formally reiterated Uruguay's traditional policy of granting bases and other facilities for defense of the American continent against external aggression, in line with the principles of continental solidarity. Nationalist opposition and Argentine protests prevented the direct granting of bases to the United States, but in September the latter government made a \$17,500,000 lend-lease grant for construction of a large naval-air base at Laguna Negra, close to the Brazilian border. Title to the base was to remain in Uruguayan hands, but it was reported that the United States would be allowed full use of its facilities.

German and Italian propaganda and other activity, meanwhile, became pronounced. Though Italians were far more numerous than Germans (the minorities were estimated at 100,000 Italians plus 500,000 citizens of Italian descent, and 6,000 Germans plus 10,000 citizens of German descent), the better organization and greater aggressiveness of the latter made them the more serious problem. The establishment of a pro-axis propaganda journal caused riots in June; its editor, a member of the chamber of deputies, was later suspended by that body. Various incidents occurred in the meantime, notably serious fascist rioting at Durazno on June 28, 1941, in which two persons were killed. After the revelations in the Hugo Fernández Artucio book and disclosure of widespread nazi intrigue in Argentina, the chamber of deputies appointed a special committee on Oct. 8, 1941, to investigate anti-Uruguayan activities in the republic. Uruguayan declarations of American solidarity were issued promptly after the Japanese attack on Pearl Harbor. The government continued diplomatic relations with the axis powers for the time being, but Pres. Baldomir and Foreign Minister Guani formally expressed the country's intention to follow its own precedent of 1917 and regard any American states at war as still possessing full nonbelligerent rights.

A regional development of great importance occurred in late January and early February 1941 when Uruguay was host to the Río de la Plata regional conference at Montevideo, a meeting of the four Platine republics of Argentina, Bolivia, Paraguay and Uruguay, attended also by Brazil, and with observers present from Chile and Peru. The conference resulted in an Argentine and Uruguayan grant of special trade treatment for ten years to land-locked Bolivia and Paraguay, with provisions for reciprocal preferential treatment of each nation's products and freedom of transit, and laid a general groundwork for a possible eventual customs union of the whole area.

The almost continuous political conflicts of the two main groups in Uruguay came, on the whole, as the result of a difference of opinion over foreign policy. The obstructionist tactics of the opposition, which had led during the preceding year to several cabinet and congressional crises, threatened to do the same in 1942. In February, Pres. Baldomir consequently dissolved the congress and postponed to November the presidential election which had been scheduled for March. The constitutional provisions giving the leading minority party a minimum of three cabinet seats and half the positions in the senate permitted the Herreristas to block governmental action simply by refusing to attend congressional sessions and thus breaking a quorum. During the eight months between the dissolution of the congress and the November elections, Pres. Baldomir ruled with the aid of a state commission, composed of a large number of prominent citizens, which he had selected to share with him the responsibilities of government.

The campaign got under way in September with the naming of Juan José Amézaga and Luis Alberto Herrera as the presidential candidates of the two main parties, respectively the traditionally liberal Colorado and the strongly nationalistic and conservative Blanco Nacionalista. The Colorado party, with its ticket supported by Pres. Baldomir, nominated an even more distinguished Uruguayan as its vice-presidential candidate; this was Foreign Minister Alberto Guani who, in addition to his outstanding record in the foreign office, had made a notable international record as chairman of the inter-American Advisory Committee for the Political Defense of the Hemisphere, with its headquarters at Montevideo. The election was held

Nov. 29, with only about 65% of the total electorate voting, partly because of the concurrent record-breaking nation-wide rainstorms. The election indicated strong approval of the administration's policies, with the government party not only electing Amézaga and Guani but also capturing control of both houses of the congress and most departmental and municipal offices; the voters, in addition, approved by decisive majorities the constitutional changes proposed by the president to remedy the legislative impasses which had frequently occurred.

At the conclusion of the third Foreign Ministers' conference at Río de Janeiro in late Jan. 1942, Uruguay severed its diplomatic relations with Germany, Italy and Japan, and announced a policy of close co-operation with the other American states against axis aggression. The army, which in 1941 had included only about 8,000 troops, was considerably strengthened and modernized with new weapons obtained largely by means of a lend-lease grant from the United States. Uruguay on July 21, 1942, signed a reciprocal trade agreement with the United States which, it was hoped, would help to offset its lost European markets and also partially to prepare for eventual postwar conditions.

Amézaga's Administration.—Pres. Amézaga took over the executive office on March 1, 1943, and continued the active collaboration in inter-American defense laid down by his party in 1941 and 1942. The vice-president elect, Dr. Alberto Guani, had visited the United States in January and signed agreements with the Export-Import bank providing for a loan of \$20,000,000 to be used for a public-improvements program in Uruguay. The government announced early in 1943 that diplomatic relations would be resumed with the soviet union, with which such contacts had been broken in 1936 following sensational charges that Uruguay was being used as a base for communist propaganda in South America. The government severed its relations with the Vichy regime in France on May 12.

The new administration began its internal program with serious obstacles to overcome. The country was faced, in addition to the usual problems of wartime, with the most severe drought in a number of years. The government, in an effort to decrease unemployment, began a public-works construction program, and the president on May a proposed legislation which would control monopolies and would serve as a basis for price and wage controls. The labour situation remained unsatisfactory during the first half of 1943, in view of low wages, a steady increase in living costs, and only slight improvement in regard to employment. Conditions improved, however, toward the latter part of the year. The drought was broken and agricultural prospects grew brighter; wool production proved to be excellent in both quality and quantity. The United States Board of Economic Warfare in July released the former ban on South American wools which had been in effect, and Uruguay was allowed to ship to the United States 60% of the amount of the 1941-42 export. The United States also began once more to import Uruguayan sheepskins. Great Britain in October signed a contract on behalf of the United Nations to take meats available for export in Uruguay for the year. The steadily increasing favourable foreign trade balance caused some concern over inflation in 1943, with some leaders favouring nationalization of foreign-owned utilities as a desirable measure to prevent it, and others wishing the surplus to be applied to repatriation of the sterling debt of £18,000,000. Rationing continued in force, especially on gasoline and kerosene, and price controls were applied on many items. The shortage of motor fuels seriously curtailed bus and truck

transportation. The government also decreed reduction of railway speeds in order to conserve irreplaceable steel rails.

Uruguay was primarily concerned in 1944 with the maintenance of its democratic position and social gains and at the same time the pursuing of a careful international policy. Domestic and foreign affairs were further complicated by the location at Montevideo of the Committee for Political Defense, presided over by Vice-President Guani. The government late in Jan. 1944, following the recommendation of the Committee for Political Defense, refused recognition to the revolutionary regime set up in Bolivia in Dec. 1943, allegedly with pro-axis support from Argentina. On June 26, however, Uruguay, in conjunction with the other American republics, recognized both the Bolivian government and a new revolutionary regime in Ecuador.

Pres. Amézaga on Jan. 13, 1944, ordered the establishment of a national committee on Uruguayan economic, financial and social postwar problems; the committee members were named June 12. The government on Jan. 29 appointed a three-man committee to fix wage ceilings in Montevideo. Some other labour difficulties occurred during the year, most serious of which was a strike of 10,000 meat-packing house workers in April; they returned to work, after a five-day stoppage, on April 17, having gained some concessions including seasonal unemployment insurance. The government on Feb. 11 began negotiations with members of the United Nations to reduce meat exports in order to relieve the domestic shortage. The senate on May 11 passed a bill aimed at restoring the eight-hour day and raising wages.

Occasional echoes of earlier Uruguayan involvements with Germany and Italy were heard in 1944. Seven Germans, including the notorious Arnulf Fuhrman, were sentenced on Feb. 5 for having engineered the sensational plot revealed in May and June 1940; Fuhrman, the alleged South American director of anti-Semitic operations, had confessed to complicity in the plot but contended that it was a joke. Two Italians were arrested on Feb. 26 for espionage. The government on April 15 seized radio sending and receiving sets, arms and nazi literature in a raid on the home of an Argentine national in Montevideo. Relations with Spain were strained at times. The Batllista, or liberal, wing of the Colorado party on Feb. 15 urged a diplomatic break with the Franco regime, and a congressional group on Oct. 17 issued a statement opposing the incumbent Spanish government. The opposition Blanco Nacionalista party, under Herrera's leadership, resolved on March 7, 1944, to continue attacking the government on domestic policies, and on March 15 its members absented themselves from the congress, thus forcing an adjournment for lack of a quorum. The senate on March 9 resolved to interpellate the foreign minister on the government's attitude toward the Farrell-Perón regime in Argentina and its relations with the Committee for Political Defense; the minister later received a vote of confidence. The government on Sept. 28 released a comprehensive proposal for postwar international organization.

Political developments in 1945 continued to be influenced largely by Uruguay's delicate geographical balance between Brazil and Argentina. The militaristic regime in the latter country aroused considerable popular opposition in Uruguay, but the government felt impelled to move cautiously. The General Workers' Union (U.G.T.) held a 15-minute general strike Jan. 9 in protest against the Argentine regime. Foreign Minister Eduardo Rodríguez Lar-

reta aroused great interest throughout the hemisphere by his proposal on Nov. 22, supposedly with Argentina in mind, that the principle of collective intervention be adopted for the Americas in case of "the notorious and repeated violation by any republic of the elementary rights of man and of the citizen." Several other foreign ministries gave qualified endorsement of the suggestion, most notably U.S. Secretary of State James F. Byrnes on Nov. 27; but the sentiment among Latin American chancelleries, traditionally opposed to all forms of domestic intervention, gradually crystallized in opposition to the proposal, and nothing ultimately came of it.

The Uruguayan congress on Feb. 21, 1945, approved a declaration of war against Germany and Japan; Juan Carlos Blanco, ambassador to the United States, signed the United Nations pact for his government on Feb. 24. The Uruguayan delegation at the inter-American conference in Mexico City in February-March took a leading part in urging a plan for a hemispheric pact of peace and mutual

guarantees. A newly formed Latin Republican union urged at Montevideo on March 22 that democratic governments should be established in Italy, Spain, France and Portugal. A serious diplomatic crisis developed between Uruguay and Spain late in September. Widespread labour unrest, accompanied by strikes, prevailed in September, caused primarily by the high cost of living. As a means of longrange attack on unemployment and labour problems in general, the government announced a comprehensive fiveyear public-works program, contemplating large expenditures especially for highway construction and improvement. Deficit financing continued in 1945 for the sixth successive year and caused serious concern in business and financial circles. The government's anti-inflation program, led by the Bank of the Republic, involved the issuance of monetary defense bonds against deposits; the government also imposed an excess-profits tax but rejected an income tax.

Social unrest continued in Uruguay, especially in Montevideo, in the early months of 1946 because of the increasingly high cost of living. A one-day general strike in the

capital on Feb. 28, protesting living costs, involved from 50,000 to 70,000 people. The government took steps in April to expropriate and nationalize the British-owned Montevideo waterworks. The most serious threat to order in the first half of the year was revealed by the government's announcement on July 1 that it had suppressed an antigovernment coup headed by a former head of the air force and apparently supported by the Asociación Pro-Renovación del Espíritu, a supposedly totalitarian lodge embracing army officers; about 30 arrests resulted. The officers gained some concessions, however; Pres. Amézaga managed to obtain a 30% pay increase for commissioned officers and also instituted an obligatory retirement system to make room for younger officers.

The second consecutive poor wheat harvest left an estimated deficit of that important cereal of 130,000 metric tons and by early in the year threatened the necessity of wheat rationing if additional stocks could not be obtained from Argentina. The Bank of the Republic subsequently contracted for purchase of 90,000 metric tons of wheat from Argentina, but that country refused to honour its commitment, allegedly because of prior obligations.

Utah

A Rocky mountain state, Utah was admitted to the union in 1896, popularly known as the "Beehive state." Area 84,916 sq.mi., including 2,570 sq.mi. of water. Population (1940) 550,310; the rural (nonfarm) population was 150,465, (farm) 94,352; urban 305,493, with the following origins: white (native) 510,662, (foreign-born) 32,298; Negro (native) 1,225, (foreign-born) 10. Estimated population of the state on Dec. 1, 1945, 620,000. Capital, Salt Lake City (149,934). Other principal cities: Ogden (43,688), Provo (18,071), Logan (11,868).

The 21st legislature which met in 1937 was characterized by its progressive character. The progressives, led by Dr. Herbert Maw, president of the senate, enacted their program, but the conservative minority, led by Governor Henry H. Blood, controlled patronage. Notable measures enacted were a direct primary law, which provided for runoff primaries and an increase in the number of districts in counties having more than one representative in the legislature; a social security act passed in conformity with federal legislation; a "little Wagner act," which provided for recognition by employers of employee-established bargaining agencies and set up agencies with power to sub-

Income from crops and livestock

Lead

Leading crops (bu.):

poena witnesses and hear disputes; and a fair trade practices act to curb monopoly and prevent discrimination against buyers. Governor Blood vetoed a measure exempting from taxation homesteads up to \$2,000 and personal property up to \$300. The legislature was criticized for enacting a budget of \$7,651,-328, the largest in the state's history and more than \$1,300,000 above the governor's figure, which was based on a revenue expectancy of about \$6,000,-000. In 1937, E. E. Monson was secretary of state; John W. Guy, auditor; Reese M. Reese, treasurer; Joseph Chez, attorney-general; and Charles H. Skidmore, superintendent of public instruction.

The elections of Nov. 8, 1938, the first under the new direct primary law, left Democrats still entrenched, controlling ap-

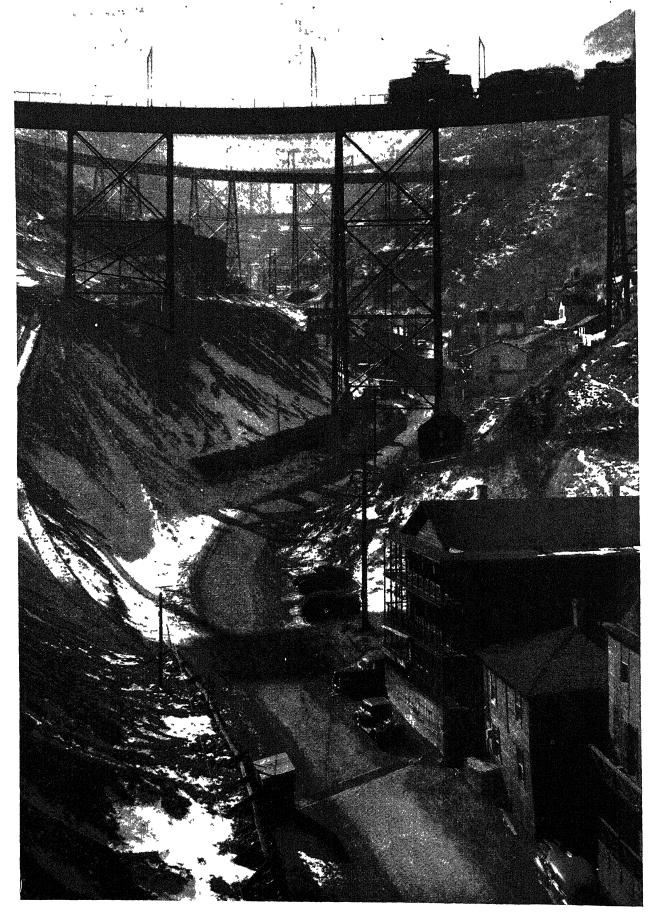

proximately two-thirds of the elective county positions, and considerably more patronage than this figure would indicate. New Deal Senator Elbert D. Thomas, chief target of the campaign, was returned for a second term, and Representatives Abe Murdock and J. W. Robinson were reelected from the first and second congressional districts respectively. William H. Folland, incumbent Republican supreme court justice, was defeated by Judge Roger I. McDonough, Democrat. With 21 Democrats and 2 Republicans in the senate, and 45 Democrats and 15 Republicans in the house, the 23rd legislature followed a more conservative course than its predecessor. Gov. Henry H. Blood counselled economies, warning that the surplus in the general fund could no longer be expected to absorb excessive appropriations.

Efforts in 1939 to prohibit married women from receiving public employment resulted only in the adoption

of a resolution urging state agencies to spread work as much as possible. Other laws provided for a fair trade practices act for agriculture by which farmers hoped to stabilize farm products prices, the relief of business from the average monthly inventory tax by substituting a year-end inventory tax, the control of small-loan agencies by the state banking department, and extension of the eight-hour day for women to all occupations.

In the 1940 presidential election, Roosevelt received 154,277 votes; Willkie 93,151; Thomas 198 and Browder 191. The veteran U.S. Senator William H. King, conservative Democrat, failed to receive renomination and his seat went to Representative Abe Murdock. Walter K. Granger was sent to congress from the 1st district, and Representative J. W. Robinson was returned by the 2nd district. Herbert B. Maw, liberal Democrat, attorney, educator and former president of the state senate, was elected governor by a plurality of 10,806 votes over Don B. Colton (Rep.). The new governor was prepared to offer the overwhelmingly Democratic legislature a progressive program including sweeping reforms in state government with a view toward efficiency and economy, and development of the state's natural resources. Composition of the legislature in 1940: senate, Democrats, 19; Republicans, 4; house, Democrats, 44; Republicans, 16.

In 1940 E. E. Monson was secretary of state; Reese M. Reese, auditor; Oliver G. Ellis, treasurer; Grover A. Giles, attorney-general; and Charles H. Skidmore, superintendent of public instruction.

In 1941, the 24th legislature adopted the sweeping governmental reorganization scheme recommended by Governor Maw, in the regular and two special sessions, It created departments of finance and publicity and industrial development and effected greater executive control over finance.

Greater co-ordination of boards and commissions was also effected.

After U.S. entry into World War II, the administration of Governor Maw co-operated with federal authorities in essential war measures and continued to perfect the governmental reorganization plan adopted by the 24th legislature in 1941.

Japanese resettlement centres were established at Topaz and Abraham.

In the 1944 presidential election, 150,088 votes were cast for President Roosevelt and 97,891 for Governor Dewey. Governor Maw was especially active in the rehabilitation of returning war veterans and the retention of permanent phases of war industrial expansion. In 1945, Ferrell H. Adams succeeded Reese M. Reese as state auditor and Dr. E. Allen Bateman succeeded Charles H. Skidmore as superintendent of public instruction; Reese M. Reese became state treasurer. E. E. Monson continued as secretary of state and Grover A. Giles as attorney-general in 1945 and 1946.

In 1946, the administration of Governor Maw co-operated with federal authorities in essential postwar measures and in all vital reconversion programs, particularly the return of Utah's gigantic Geneva Steel plant to private industry, and preliminary work on the great reclamation project of central Utah, known as the Central Utah project.

The state continued to aid business and industrial interests in the expansion of manufacturing, mining, metallurgical and transportation industries and in encouraging

eastern and Pacific coast industrialists and manufacturers to establish branch factories in Utah.

Van Acker, Achille H.

Van Acker (1898–), Belgian statesman, became a Socialist member of the chamber of deputies in 1927. Minister of labour in the Pierlot government, he formed a coalition government on Feb. 11, 1945, after Pierlot's resignation, and assumed personal charge of the production and distribution of coal. He presented the resignation of his cabinet (June 16, 1945) in protest against King Leopold's proposed return to the throne. After the chamber of deputies voted to continue the regency, Van Acker formed a new government.

After the elections of Feb. 17, 1946, Van Acker resigned; failure of other candidates to form a government acceptable to parliament led to his recall and on March 31 he formed a new cabinet without Catholic representation. His cabinet fell again on July 9 after losing a vote of confidence in the senate by one vote; he refused to form another cabinet and was succeeded by Camille Huysmann as premier.

Vanadium

Aside from small irregular amounts from Mexico and Argentina, the world output of vanadium continued to come from the four countries listed in the following table:

				٧	Vo!	-Id	Productio	n of Vanadi	um		
					(Sł	tori	tons of n	netal conter	it)		
							1937	1939	1941	1943	1945
Northern Rhodesia							259	423	377	533	232
Peru							643	1,097	1,121	943	684
South-West Africa							652	567	297	636	463
United States	•	•	٠	•	•	٠	544	992	1,2 <i>57</i>	2,793	1,482
Total							2,150	3,190	3,100	4,950	2,870

In general the United States consumed its domestic output and that of Peru (more than two-thirds of the total), while Rhodesia and South-West Africa supplied the rest of the world.

The trend of the industry in the United States is indicated by the following data, in short tons of vanadium content:

						1937	1939	1941	1943	1945
Mine shipments						543	992	1,257	2,793	1,482
imports		٠	٠	•		629	1,066	1,069	1,058	789
Peru						629	1,066	1,068	1,026	776
Consumption .	٠					ş	ŝ	ŝ	3,631	2,547

Vanadium supply was worked on a narrow margin throughout World War II. Consumption accounted for during 1942-45 actually added to somewhat more than production plus imports. The Metals Reserve company was able to accumulate a small emergency stock pile, which

reached a peak of about 670 tons of contained metal; but this was sold out in 1945.

Consumption of vanadium continued to be practically entirely in the compounding of alloy steels. With the cessation of war uses, demand naturally declined sharply but could be expected to approximate the prewar level of demand, with some additions to cover civilian uses that were cut short by war demands, and for the extension of war applications to new peacetime uses. (G. A. Ro.)

Vandegrift, Alexander Archer

Vandegrift (1887—), U.S. marine corps officer, was born March 13, 1887, in Charlottesville, Va. He studied at the University of Virginia for two years and later was graduated from the basic school and the field officers' school of the marine corps. He entered the marine corps as a second lieutenant in 1909, participated in the landing in Nicaragua in 1912 and at Veracruz, Mexico, in 1914. In World War I he was stationed in Haiti and in the 1920s he held assignments in China. Advancing through the grades, he was promoted to brigadier general in 1940 and the following year he became assistant commandant of the marine corps.

In 1942 Vandegrift, a major general, commanded U.S. marine forces that landed in the Solomon Islands. For his achievements on Guadalcanal, he earned the congressional medal of honour and a promotion to lieutenant general. On Nov. 1, 1943, he led the marines again in their first landing on Bougainville. Shortly thereafter, he was recalled to Washington, D.C., to succeed (Jan. 1, 1944) Lt. Gen. Thomas Holcomb, retired, as commandant of the marine corps. He was raised to the rank of a full general March 29, 1945. On March 28, 1946, Vandegrift was appointed to President Truman's newly established ten-man military committee to plan national defense. His status as a four-star general was made permanent on April 2, 1946.

Vandenberg, Arthur Hendrick

Vandenberg (1884—), U.S. statesman, was born March 22, 1884, in Grand Rapids, Mich. He studied at the University of Michigan law school, but lack of funds forced him to leave school after the end of his first year. He joined the *Grand Rapids Herald* as a reporter, becoming editor and general manager of the paper by the time he was 22. Later he became active in Michigan state politics. In 1928 he was appointed to fill the senate vacancy caused by the death of Sen. Woodbridge Ferris and in November of that year he was elected to serve the remainder of the term as well as the following term. He was re-elected in 1934, 1940 and 1946.

Prior to U.S. entry into World War II, Vandenberg was one of the noninterventionist leaders in congress and had attacked the lend-lease bill and aid to Britain. After the attack on Pearl Harbor, however, he upheld the Rooseveltian line on foreign policy, and in 1944 he was instrumental in getting the Republican party to favour employment of force to maintain peace. The following year Roosevelt appointed Vandenberg as a delegate to the United Nations conference in San Francisco.

Secy. of State James Byrnes relied heavily on Vandenberg for advice during the sessions of the Council of Foreign Ministers in London in the late fall of 1945 and at the U.N. sessions in London (Jan.—Feb. 1946). On his return from the London sessions of the U.N., Vandenberg told the senate that the U.S. and the soviet union could live together in "reasonable harmony if the United States

speaks as plainly on all occasions as Russia does."

After the Republican triumph in the elections of Nov. 1946, Vandenberg was regarded as one of the outstanding G.O.P. candidates for the presidential nomination in 1948.

Van Devanter, Willis

Van Devanter (1859–1941), U.S. jurist, was born April 17, 1859, at Marion, Ind. He graduated from the Cincinnati law school in 1881, and later practised law with his father in Marion. In 1884 he left for Wyoming, where he supervised revision of the state's statutes, became city attorney of Cheyenne, a member of the territorial legislature, and later chairman of its judiciary committee. In 1889 he became chief justice of the Wyoming supreme court, but resigned the next year to resume private practice. Active campaigning for McKinley brought him appointment as U.S. assistant attorney-general in 1897. In 1903 Theodore Roosevelt appointed him judge of the eighth circuit court of appeals. He was named to the supreme court by President Taft in 1910. Van Devanter was not a prolific writer of opinions. A conservative, he dissented frequently in decisions regarding New Deal legislation, and he resigned in 1937. Van Devanter was dean of the supreme court after the resignation of Justice Oliver Wendell Holmes in 1932. After his retirement he occasionally sat in the New York federal court. He died in Washington, D.C., Feb. 8, 1941.

Van Mook, Hubertus Johannes

Van Mook (1894—), Netherlands statesman and colonial official, was born in Semarang, Java, and was educated at Surabaya college in the East Indies and at Amsterdam, Leyden and Delft universities in the Netherlands. He joined the Netherlands Indies civil service in 1918 and held a number of colonial posts in Indonesia. A member of the People's council from 1931 to 1934, he was chief of the bureau of economic affairs, 1934–37, and director of economic affairs, 1937–42.

Van Mook headed the Netherlands delegation that handled negotiations with the Japanese in 1940 and 1941. The Japanese delegates, strengthened by Vichy's cession of bases in French Indo-China, attempted to frighten the Netherlands mission into yielding to their demands for economic concessions. But Van Mook refused to agree to any moves that would imperil the economic and territorial sovereignty of the Indies and the negotiations ended in a stalemate.

After the Japanese attack in Dec. 1941 against U.S., British and Dutch possessions in the Pacific, the Netherlands government-in-exile in London appointed Van Mook lieutenant governor of the Indies in Jan. 1942 and later as minister of colonies. He resigned from the latter post in Feb. 1945.

On his return to the East Indies following the close of World War II, Van Mook was the principal Netherlands delegate in negotiations with members of the Indonesian "republic."

Van Zeeland, Paul

Van Zeeland (1893—), Belgian statesman and economist, was born at Soignies in 1893. Educated at the University of Louvain and at Princeton university, N.J., he entered the Belgian national bank in 1922, becoming a director in the institution in 1926. He also joined the faculty of law at Louvain as a professor in 1928 and founded the Louvain Institute of Economic Sciences.

Van Zeeland represented Belgium at various international conferences between 1922 and 1933. On March 25, 1935, he became prime minister of a coalition cabinet in which

he also held the portfolios of foreign affairs and foreign commerce. This government resigned in May 1936, and Van Zeeland formed a new one on June 14 of that year. At the request of Britain and France, he undertook an exploratory economic mission to investigate ways and means of overcoming obstacles hindering world trade and visited the U.S. in June 1937 to confer with President Roosevelt. After his return, he faced political opposition in the parliament; unable to get a vote of confidence, he resigned Oct. 25, 1937.

After the German occupation of Belgium in 1940, Van Zeeland associated himself with the Belgian government-in-exile in London and was named chairman of the Belgian commission on war problems. Following the close of World War II, Van Zeeland made several trips to the U.S., presumably for discussion of economic and political problems. On April 20, 1946, the Egyptian government announced that he had accepted its offer to become a consultant and adviser on financial problems.

Vargas, Getulio Dornelles

Vargas (1882—), Brazilian politician, was born at São Borja, Brazil, on Apr. 19, 1882. He entered the army at the age of 16 and studied for a year at the Rio Parde military college. In 1903, he left the army to study law at the University of Porto Alegre, obtaining his degree in 1907. In 1923, he was elected federal deputy for the state of Rio Grande do Sul.

Rising rapidly in the Brazilian political arena, he was minister of finance in 1925 and governor of R10 Grande do Sul in 1927. He became president of Brazil in 1930 by virtue of a coup d'état that he himself inspired and led. Proceeding to strengthen his power, Vargas put down a revolt in 1932 and introduced a strongly nationalistic constitution in 1934. He repudiated the terms of that charter (which prohibited a president from succeeding himself) by establishing himself as dictator in 1937 and calling off scheduled elections. He dissolved the houses of parliament, and drafted a new constitution which perpetuated his dictatorship, although it provided for a plebiscite at some "future date."

Vargas' rule was modelled on near-absolutist lines. In foreign policy, however, he supported the United Nations and declared Brazil at war with the axis nations in 1942.

Toward the end of World War II, he set the date for the long-delayed presidential elections for Dec. 2, 1945. He resigned on Oct. 29, 1945, leaving José Linhares, chief justice of the supreme court, as interim president until after the voting.

Vargas was elected senator of the state of Rio Grande do Sul and was sworn into office June 4, 1946.

Vasconcellos Mottas, Carlo Carmelo de

Cardinal Vasconcellos (1890—), Brazilian prelate, was born July 16, 1890, in the state of Minas Gerais. He was ordained priest in 1918 and was appointed auxiliary bishop of Diamantina in 1932. Four years later he was elevated to archbishop in the metropolitan see of São Luiz de Maranhão. After the death of Archbishop Affonseca e Silva, he was transferred by the Holy see to the metropolitan see of São Paulo, second largest in South America, and was installed in his new post in Oct. 1944. Named to the

Sacred College of Cardinals Dec. 23, 1945, he was created cardinal on Feb. 18, 1946.

Vasilevsky, Alexander Mikhailovich

Vasilevsky (1905—), soviet army officer, was a tsarist soldier during World War I and joined the Communists during the revolution of 1917. After the war he studied at soviet general staff schools and assisted in the reorganization of soviet armies following the Russo-Finnish war of 1939—40. Attached to the soviet high command in 1941, Vasilevsky served under Marshal Georgi Zhukov. He held the rank of major general in 1941, rising to the highest grade, marshal of the soviet union, in 18 months. In Nov. 1942 he was named deputy chief of staff, and became chief of staff upon the retirement of Marshal Boris Shaposhnikov. Vasilevsky's appointment to this high post was regarded as part of Stalin's plan to revitalize his general staff with younger men.

Vasilevsky retired from his post as chief of staff in 1944 to assume command of one of the soviet armies that reconquered the Crimea and Sevastopol. In early 1945 he assumed command of the 3rd White Russian army and led the drive that culminated in the capture of Königsberg, April 9, 1945.

Following the defeat of Germany in Europe, Vasilevsky was shifted to the far eastern front, where he was commander in chief of soviet forces that invaded Manchuria in Aug. 1945. In the merger of the soviet armed forces, decreed by the soviet council of ministers, March 22, 1946, Vasilevsky was elevated to the post of chief of staff of the newly-unified services.

Vatican City State

A tiny area of 108.7 ac. situated in the heart of Rome and completely surrounded by Italian territory, the Vatican City state is the official seat of the Roman Catholic Church and the official residence of the pope and the College of Cardinals. The city state, whose extraterritorial rights were restored by the Lateran treaty of 1929, enjoys the full rights of a sovereign state. Recognized in international law, the Lateran accord legalized the status of the reigning pope as temporal ruler over this area.

Physically, Vatican City consists of the papal palace, the Vatican library, museums and gardens, St. Peter's basilica and the immediately adjacent area (including the spacious Piazza di San Pietro). Castel Gandolfo, the papal summer estate, and certain basilicas in Rome enjoy extraterritorial privileges, although they are beyond the physical confines of the city state.

Vatican City is administered by a civil governor appointed by the pope. The governor, who rules with executive powers, deals with purely secular matters. The law of the Vatican area derives basically from canon law and ecclesiastical procedures rather than from Italy's civil code.

Vatican City's independence is reflected in a variety of ways; it has its own railroad depot, radio station and postal service. It mints its own coins (although Italian currency is accepted as legal tender within its confines), issues its own stamps and publishes its own newspaper, Osservatore Romano.

Its "defense forces" consist of Swiss guards and papal gandarmes. During World War II, this force, normally comprising about 100 guards and 70 gendarmes, was substantially increased. The small Vatican "army," however,

does not police the Piazza di San Pietro. While the large square is recognized as part of the Vatican City under the Lateran treaty, it is subject to the authority of the Italian police.

The population of Vatican City in 1932 was 1,025. Ten years later (1942), the population was estimated at about 800. The latter figure did not include the Vatican diplomatic colony consisting of representatives whose countries broke off relations or were at war with Italy. All of the regular inhabitants of the city state are Italian-speaking Roman Catholics, mostly of Italian or Swiss descent.

(X.

Momentous Decade.—The decennium 1937-46 in the history of the Vatican City spanned a momentous period of world history. At its opening totalitarian dictatorships were in power in Italy, Germany, the U.S.S.R. and Spain. In other countries of Europe these dictatorships were not without many sympathizers and supporters. After the signing of the Treaty of Versailles, grave problems remained in the international society. Conferences and agreements among the nations failed to establish confidence and real peace. The period evidenced a wide loss of faith in democracy to meet the problems of the times in many parts of Europe. Underneath all the confusion was a departure in political philosophy from the traditions of western civilization. Conventions were substituted for moral principles. The dignity and rights of the individual were made at most mere concessions of the absolutistic state in some countries. Nationalisms were exaggerated and it came about that, when sacrifices for the common good were needed, stress was placed on real or fictitious national grievances. Communism, fascism and naziism were new aggressive systems based on state absolutism.

The papacy stood an uncompromising foe of these political absolutisms. Efforts were made to bring about freedom of religion even in these difficult conditions, and they failed. It may be said that the major struggle of the papacy in this decennium was with totalitarianisms. It was not the papacy entering into the political field; through modern history the popes had abstained from sanctioning any particular political form. The plain fact which faced the church was that these systems were a mighty aggression against Christian truth. It was the religious errors in them which had brought forth the condemnations of Pope Pius XI (q.v.). If he made every possible effort to secure religious freedom in the countries in which they had seized power, it must be kept in mind that at the very appearance of fascism in Italy, the absolutism in it was condemned by the pope.

There were some who without studying the facts accused the papacy of friendliness to fascism and naziism. Nothing could be more untrue when the facts are examined. There is a difference between trying to mitigate an evil and approving and embracing it. All efforts of the pope to secure fundamental freedoms proved unavailing. In fascist Italy there went on constantly a fascist attack on the rights of religious organizations and religious activities. Pope Pius XI never lost an opportunity to assert these rights and to point out the errors in fascist policy. After Mussolini's full acceptance of nazi racism, the pope clearly spoke out for the rights of minorities and in the plainest language condemned anti-Semitism. In Germany it became plain that naziism was an attack on Christianity. There was persecution of the church and a brutal attempt to censor even the preaching of Christian truth. The concordat with the nazi government was scarcely signed when Hitler violated it. There could be no ideological truce between the papacy and these political totalitarianisms.

On Passion Sunday, March 14, 1937, Pope Pius XI issued his encyclical letter, "Mit Brenender Sorge," written in German, condemning naziism and protesting its violation of religious freedoms. This letter made clear the mind of the papacy. The pope told its purpose: "As you kindly visited Us as we lay on our bed of sickness, so today we turn to you and through you (that is, the Bishops of Germany) to the Catholic faithful of Germany, who, like all suffering and oppressed children, are particularly close to the heart of the Common Father. In this hour when their faith is being tried like pure gold in the fire of tribulation and concealed and open persecution, when they are surrounded by a thousand forms of organized bondage in matters of religion, when the lack of true information and absence of the customary means of defense weighs heavily on them, they have a double right to the words of truth and spiritual comfort from him, to whose first predecessor the significant words of the Saviour were spoken: 'But I have prayed for thee that thy faith fail not; and thou, being once converted, confirm thy brethren." In this letter the pope pointed out what was well known to the Catholics of Germany, that their political leaders were trying to destroy the church in Germany. It must be kept in mind that this letter was written at a time when the leaders in many nations still thought that there could be effective compromises with Hitler.

Five days after issuing the encyclical letter, "Mit Brenender Sorge," Pope Pius XI, on March 19, 1937, issued his encyclical letter, "Divini Redemptoris," on atheistic communism. In it he called "bolshevistic and atheistic communism" an imminent danger "which aims at upsetting the social order and at undermining the very foundations of Christian civilization." After condemning the religious errors of atheistic communism, the pope, in an appeal for a great Christian social renaissance, for which he had worked so ardently, said: "It was Christianity that first affirmed the real and universal brotherhood of man of whatever race and condition. This doctrine she proclaimed by a method and with an amplitude unknown to preceding centuries; and with it she potently contributed to the abolition of slavery. Not bloody revolution, but the inner force of her teaching made the proud Roman matron see in her slave a sister in Christ. It is Christianity that adores the Son of God, made man for love of man, and become not only the 'Son of a Carpenter' but Himself a 'Carpenter.' It was Christianity that raised manual labour to its true dignity, whereas it had been hitherto so despised that even the moderate Cicero did not hesitate to sum up the general opinion of his time in words of which any modern sociologist would be ashamed: 'All artisans are engaged in sordid trades, for there can be nothing ennobling in a workshop."

On March 28, 1937, the pope issued his encyclical on the persecution of the church in Mexico. It was a plea to the Catholics of Mexico to strengthen in themselves deep Christian life. In it he stressed the principles underlying the Christian social program and concluded with "an appeal to unity, charity and peace, in the apostolic labour of Catholic Action, which must give Christ back to Mexico and restore there peace and also temporal prosperity."

The story of the last years of the pontificate of Pope Pius XI is a continuation of his efforts to defend and vindicate the dignity and rights of man and to stress the Christian ideal of brotherhood in social and political life. With a sad heart he saw the darkening of the clouds on

Pope Pius XII during an informal interview with Allied press correspondents and servicemen at the Vatican, two days after the liberation of Rome in June 1944

the horizon of the world, and he knew that danger was at hand. A few days before he died he sent out orders for the bishops of Italy to come to Rome and hear from him an important message The message was never delivered. Death came to him. The message remained in the archives of the Vatican, and some day historians would know the last of the works of a great, courageous pope to protect and defend the freedoms of man and proclaim the Gospel of Christ as the only safe charter for world reconstruction.

In the midst of his gigantic struggle against the new materialistic ideologies, Pope Pius XI merited the title of "The Pope of the Missions." The Mission exhibitions in the Vatican focused the attention of Catholics everywhere on the missions. His reorganization of the Pontifical Mission Aid societies brought larger resources for their support and extension. He knew intimately every mission field. In his mission program he stressed the need of native clergies, promoted natives to the episcopacy and did much to penetrate with Christian truth native cultures. His mission work brought admirable results and, while he saw cruel persecution of the church in many parts of the western world, he had the consolation of seeing the church grow and prosper in many mission fields.

Accession of Pope Pius XII.—The conclave which elected the successor of Pope Pius XI was short. There came from it Pope Pius XII (q.v.), who had been the secretary of state. His talents, experience, traits and virtues made him admirably fitted for the papal office in one of the most critical periods of its long history. The popes of modern times have given the program of their pontificates in their first encyclical letters. Pope Pius XII significantly began his first encyclical with the words: "Darkness over the earth." The clouds of war were gathering fast; the aggressive spirit of naziism was no secret. It respected no rights and proclaimed as its end nothing less than world domination. In his program the pope pointed out the basic errors which gave rise to totalitarianism and refuted them with masterly argument. He left no doubt as to his program. It would be to try to make men see that Christian truth alone could be the safe foundation for individual and social prosperity. In this letter he wrote: "Even as we write these lines the terrible news comes to us that, in spite of all the prayers we have offered to avert them, the fires of war have been lit. The pen might well drop from Our hand, when we reflect on the countless calamities which are overtaking those who till now, in their private lives, enjoyed some measure of prosperity. Our heart sickens, as a father's heart must, at the prospect of the harvest which will grow from the dark seeds of violence and animosity, for which war is now tracing furrows in blood. And yet, as We think of the bitter troubles that are now brewing, and shudder at the worse troubles to come, We feel it Our duty all the more to direct men's hearts and minds, where good will is still to be found among them, towards Him who alone can bring salvation to mankind."

The peace efforts of the pope failed. The invasion of Poland was a blow to him, and in it he saw all the cruel fury of the nazis' total war. Then there came the overrunning of the Netherlands and the fall of France. Mussolini joined with Hitler. Two great things the pope could do; he could do his utmost in charity for the innocent victims of aggression; and he could point out the way to a lasting peace. His relief work is so well known that it needs no mention. It is enough to say that he sought in every possible way to defend and succour the suffering victims. Cut off from communication with the bishops in many countries, with fascists and nazis in the eternal city, he worked and laboured for a just and lasting peace.

On Christmas Eve, 1939, the pope gave to the world his Five Point Peace plan, a comprehensive statement of the essentials of a good lasting peace in the international family. Year after year through World War II he enlarged and detailed this plan. Briefly the plan called for the assurance to all nations, great or small, powerful or weak, of their right to life and independence; mutually agreed, organic and progressive disarmament; the erection of a juridical institution to guarantee the loyal and faithful fulfilment of conditions agreed upon and, in case of necessity, to revise and correct them; satisfaction of the real needs and just demands of nations and populations and of racial minorities; recognition of moral values in international life. If we assemble all the peace statements of the pope, we find in them a true pattern for lasting international peace and a sound world reconstruction. As the war progressed, it became clear that the pope would admit no fatal compromises and that he recognized clearly the grave difficulties which would confront the peacemakers. It may be said that his efforts for peace were indeed a wonderful contribution to clear thinking during years when the minds of many leaders were confused.

It is remarkable that Pope Pius XII during these busy

years of his pontificate found the time to do monumental things in the life of the church. He approved a new latin translation of the Psalms and introduced it in the use of the church. His encyclical letter on the mystical body is a document which will be read and quoted through centuries. He continued the work of his predecessor for the missions. He did much in perfecting the government of the Vatican City, which quite naturally during these troubled times became a refuge for many innocent victims of unjust persecution.

A notable encyclical issued by him Nov. 1, 1939, was a letter to the hierarchy of the United States on the occasion of the 150th anniversary of its establishment. As cardinal secretary of state, he had visited the United States and travelled by aeroplane from coast to coast. His impressions on that visit gave him the highest esteem for the country and an intelligent grasp of the problems which confronted U.S. church authorities. In referring to the social question, he expressed the hope that the U.S. people "with its genius for splendid and unselfish action" would settle this question "with due regard for the public welfare and the dignity of man." It is interesting to quote his demand that "the good things of life which the Creator has created for the benefit of all men should find their way to all alike in a just proportion." In the same letter he stressed what in one of his peace statements he again repeated, that the sanctity and freedom of the family is at the base of all right social life.

Summing up the history of the Vatican City in this decennium, we may point out the unceasing, brave defense by the popes of the dignity and rights of man, the warning to the world that justice and charity must inspire social life and its activities, the uncompromising condemnation of the excesses and unreasonable demands of the totalitarians, the call for a true Christian social renaissance, the courageous stand for justice and truth in the midst of dangers and threats, the constant pastoral solicitude for all souls, and the proclamation to the whole world that in Christian civilization alone is there the hope of lasting peace and a right ordering of the lives of nations. Vatutin, Nikolai Fedorovich

Vatutin (1901–44), soviet army officer, was born Dec. 16, 1901, in the Valuiki district of the Kursk region. In April 1920 he was drafted into the Red army as a private. Virtually unknown outside of the U.S.S.R. during the early phase of World War II, Vatutin achieved fame after Stalin reshuffled his general staff and moved him and others of the "younger generals" up to command posts.

As commander of the North Don army, he engineered the break-through of German defenses northwest of Stalingrad, Nov. 19, 1942, and the offensive launched in Feb. 1943 that carried his army to the approaches of the Dnieper river.

During the summer of 1943, Gen. Vatutin's forces beat back the last major German offensive in the Orel-Belgorod sector. His 1st Ukrainian army then counterattacked and crossed into Poland by Jan. 1944. Vatutin, in failing health, relinquished his command in March 1944 to Marshal Georgi Zhukov. He died in Kiev following an operation, on April 14, 1944.

See WAR PRODUCTION; WORLD WAR II.

Vegetable Oils and Animal Fats

The vital importance of oils and fats, and the wide disruption of world production and trade in these materials was one of the most striking changes of the decade 1937–46. The plentiful supplies of the prewar period were inadequate to meet the increased demand of the war period for food and industrial uses. World War II disrupted the normal flow of trade and cut off the United Nations from 40% of the world's export supplies of vegetable oils and a considerable part of animal fats.

The war needs were met by widespread changes and expansion of vegetable oil crops in the United States and some other areas accessible to the Allies. Before the war, most of the international trade in oils and fats consisted of vegetable oils and marine oils. Animal fats were mainly consumed in the countries which produced them.

United States fats and oils production in 1937 was about 7,000,000,000 lb. and increased slowly to 8,780,000,000 lb. in 1940. Imports in 1937 were 2,695,000,000 lb., which declined to 1,897,000,000 lb. in 1941, then dropped to about half this amount annually through the war period. Imports from the far east were cut off by the Japanese invasions, by the shortage of shipping and by submarine warfare. Whale-oil production practically ceased. The United States imports had consisted primarily of copra from the Philippines, palm oil from the Netherlands Indies, flaxseed from Argentina and tung oil from China. The United States became a net exporter in 1943 and 1944.

Total consumption of primary fats and oils for all uses was estimated at 9.203,000,000 lb. in 1937, then declined slightly to 9,035,000,000 lb. in 1938 and increased again in 1941 to 10,924,000,000 lb., which level was well maintained through 1944. The part of this supply used for food products was at its peak in 1941 at 6.883,000,000 lb., then declined to the end of the war. Industrial uses took an increasing part of the total, nearly 4,000,000,000 lb. in 1941 and 3,682,000,000 lb. in 1945. Measured by per capita consumption, the supply was 44.7 lb. in 1937 and only 41 lb. in 1945, while the industrial uses took 22.8 lb. per capita in 1937 and 26.2 lb. in 1945.

The production of oil-bearing crops was increased to 10% more than the previous record by 1942, but this amount was inadequate to meet the need. By 1943, the output of oil-bearing crops was 300% more than in 1937. Price incentives were offered by the War Food administra tion in 1942 in the form of support prices for cottonseed. soybeans and peanuts. In 1943, the Commodity Credit corporation became the sole purchaser of peanuts from growers and handled the subsidies through the handlers, crushers and shellers. Imports of oils and oilseeds were placed under control. The Combined Food board controlled all purchases from other countries and allocated the exports among the United Nations. The use of fats by industries was restricted to amounts less than the average for 1940-41. Certain amounts were set aside for government purchase for lend-lease and military purposes. Consumer rationing was begun in 1943, and a system of collecting used fats from householders was started, these amounts to be used for industrial purposes.

The United States supply of oils and fats continued short through 1945 and well into 1946. The smaller sup-

plies of lard, butter and flaxseed and the heavy demands for export made it necessary to continue strict rationing into 1945 and to limit the supplies to manufacturers. The government continued to stimulate production of both vegetable and animal fats.

The vegetable oil crops of the United States of chief importance during the decade 1937–46 included cottonseed, soybeans, flaxseed, peanuts and tung. With the shrinking cotton crop, the production of seed declined steadily during the decade from 7,844,000 tons in 1937 to 3,664,000 tons in 1945 and 3,452,000 tons in 1946. The proportion crushed was larger after 1940, amounting to 3,465,000 tons in 1945. The higher price of the oil stimulated more crushing. The price of cottonseed was supported to stimulate crushing. After 1940, the season price was above parity—\$52.50 per ton compared with parity at \$39 per ton in 1945.

Soybean production increased steadily and rapidly after 1927, and the quantity crushed for oil was at a high point in 1937. The total production of beans was 46,164,000 bu., of which 30,310,000 bu. was crushed. The crop doubled by 1939, then receded a little before making the great increase from 77,468,000 bu. in 1940 to 191,722,000 bu. in 1945. The 1946 crop was smaller. During 1944 and 1945, more than 150,000,000 bu. were crushed for oil each year. In terms of oil, soybean oil production rose from an average of 419,000,000 lb. in 1937-41 to 1,392,000,000 lb. in 1945. The price of soybeans rose from 67 cents per bushel in 1937 to \$2.06 in 1945. A subsidy was paid to processors equal to 30-35 cents per bushel. Exports were up to 11,-833,000 bu. in 1939 but dropped to only 85,000 bu. in 1940 with the outbreak of the war and then began to recover in 1944, when 3,000,000 bu. were exported. Imports of oil were about 3,000,000 lb. in 1937, exceeded by exports of 6,650,000 lb. The big exporters of soybeans in the prewar years were Manchuria and China.

Peanut oil was an important food oil through the decade 1937-46; it was usually too expensive for industrial uses. United States production in 1936 was 77,912,000 lb., of which 55,747,000 lb. were imported. The production of oil increased to 85,467,000 lb. in 1938 while imports dropped off sharply. Total peanut production averaged 1,392,000,-000 lb. in the period 1937-41 and increased to 2,091,075,-000 lb. in 1946. The peanut crop for crushing increased from 195,000,000 lb. in 1937 to 558,000,000 lb. in 1940 and then averaged around 400,000,000 lb. through 1946. The demand for peanuts for peanut butter and salted nuts increased during the early war years. Prices of peanuts were supported at 90% of parity, the average season price rising from 3.3 cents in 1937 to 8 cents in 1945. World production of peanuts increased steadily and frequently was the largest single oil crop. Most of the crop was produced in India, West Africa, China and the United States; and about one-third was crushed for oil.

By 1945 flaxseed and linseed oil production had increased rapidly to five times the production of the seed in 1937 and nearly twice the amount crushed for oil. The flaxseed crop of 1937 was 7,070,000 bu., which expanded to the record of 51,946,000 bu. in 1943 and then declined to 22,842,000 bu. as estimated in Sept. 1946. United States flaxseed production had been at a low level during the dry years 1934–38 in the flax belt of the northwest. Imports were large since Argentina, the principal producer, had large crops. The price of flaxseed rose from \$1.87 per bushel in 1937 to a high of \$2.90 in 1944. While prices to growers had reached parity, the government offered a special payment of \$5 per acre for the 1945 crop which would bring prices up to about \$3.40 per bushel for 1946. Linseed oil was in demand as a food principally in the soviet

union and India. In the United States it continued to be used in paints, varnishes, etc.; hence the demand was expected to increase during the reconstruction period and the government stimulated production.

The tung oil supply of the United States consisted chiefly of imports from China in 1937, amounting to 129,-213,000 lb. Imports declined rapidly after the outbreak of war to 8,345,000 lb. in 1943. The production of tung nuts in Georgia and other gulf coast states amounted to 11,000 tons in 1940 and increased to 33,100 tons in 1945. Large numbers of young trees were coming into bearing, and production was expected to increase rapidly. The United States output of oil was about 5,000,000 lb. in 1937, 8,600,000 lb. in 1945 and more than 10,000,000 lb. in 1946. The price of the oil averaged 16.7 cents per pound during 1935-39 and then increased in 1942 to 39.6 cents, where it remained through the war. China continued to dominate world production of tung oil and the United States took most of the exports after 1924. Small amounts of the nuts were produced in Argentina and Brazil. The exports from China became a government monopoly in 1938, when this product was balanced against a loan of \$25,000,000. Imports to the United States had an average annual value of nearly \$20,000,000 during the period 1935-39.

Olive oil production increased from an average of about 4,000,000 lb. during 1935-39 to 10,900,000 lb. in the peak year 1940, then declined again to 4,500,000 lb. in 1944 and about the same in 1945 and 1946. Imports averaged more than 61,000,000 lb., 1935-39, then dropped to 600,000 lb. in 1943. By 1944 imports were recovering and 8,800,000 lb. were imported. The crop of the Mediterranean area was low in 1945 because of the drought and imports continued below the prewar level. Olive production can be increased only slowly and the crop varies greatly from year to year. Olive oil was also meeting increased competition from other oils because of technical improvements and was not likely to become an important United States crop.

Animal Fats and Oils.-Lard and butter are the principal animal fats of United States production. Since the output of butter was restricted during the war period, lard became of vital importance. The enormous expansion of the hog industry supplied a large output of lard at the time of vital need. From 1935 to 1938, lard production was lower than it had been in the previous 15 years. In 1937 the output was 1,417,000,000 lb. and exports were at a low level. As hog production increased, the lard output rose but not at the same rate, since the high price of pork led to less careful trimming, and the ratio of lard production declined. At one time in 1944 the lard output was about 30 lb. per hog slaughtered, while in later months the output was up to more than 35 lb. per hog. Production rose to a record of 3,200,000,000 lb. in 1944, then declined to about 2,100,000,000 lb. in 1945 and 1946. Military and lend-lease needs took a large part of the lard output, reaching a maximum of 894,400,000 lb. in 1944. Of this total, 293,900,000 lb. were sent to the soviet union, 393,900,000 lb. to Britain and 170,000,000 lb. to other countries. Exports began to decline in 1945 and were only 530,000,000 lb. About half of this lard came from stocks accumulated in 1944. The reduced production in 1945 was the result of the decline of about 29% in the pig crop.

The use of lard in manufactured products changed markedly during the war years. During 1935-39 the total amount used averaged 5,800,000 lb. and increased to 240,600,000 lb. in 1944, then dropped to 112,100,000 lb. in 1945. Most of that used in 1944 was for soapmaking,

which was restricted in 1945 to only low-grade lard. The supply of lard for civilians was 10.5 lb. in 1937 and increased to more than 14 lb. from 1940 to 1944, then declined to 12 lb. in 1945. During the war years the military and relief consumption increased up to 159,000,000 lb. in 1945.

U.S. Oils and Fats Production, 1937–46 (In millions of pounds)

			Average 1937-41	1942	1943	1944	1945	1946
Butter			2.211	2,130	2,015	1,815	1,699	1,502
Lard			1,964	2,469	3,056	3,215	2,132	2,167
Edible tallow .			213	277	259	198	202	124
Inedible tallow			1.167	1,742	1.650	1,943	1,751	1,654
Marine oils			243	158	175	214	172	127
Corn oil			155	248	237	211	205	198
Cottonseed oil	-	:	1.472	1,386	1.313	1,132	1,273	964
Peanut oil	-		87	77	153	108	95	101
Soybean oil .	-		419	762	1.234	1,246	1,392	1,449
Linseed oil		:	277	699	715	729	454	516
Other			21	35	40	34	40	34
U.S. total .			8,230	9,983	10,848	10,845	9,427	8,846

Butter production increased from 1937 to 1941 and then declined to the lowest output in 15 years because of restrictions on creamery operations and the strong demand for whole milk and cheese. The decline was from 2,096,-000,000 lb. in 1937 to about 1,502,000,000 lb. in 1946. Military supplies absorbed 145,000,000 lb. in 1942, 263,-000,000 lb. in 1943, 312,000,000 lb. in 1944 and 249,000,000 lb. in 1945. In late 1945 some of the military stocks were released for civilian use. The civilian supply was 16.3 lb. per capita in 1937 and declined to 10.9 lb. in 1945, the smallest in more than 30 years. Margarine production doubled from 1939 to 1943, but the per capita consumption increased only from about 3 lb. to 4 lb. during the decade. The amount of shortening fats remained constant through the decade, but civilians received about a pound less. Other fats increased slightly during the period. Household fat collections amounted to 7%-8% of the total output of inedible tallow and grease. (See Butter; Coconuts; COTTON; MARGARINE; PEANUTS; SOYBEANS.) (J. C. Ms.)

Vegetables

Total production of all vegetable crops in the United States for sale fresh and for processing increased through the decade 1937-46 somewhat irregularly to a new high record in 1946. Total commercial truck crops were estimated by the U.S. department of agriculture at 10,130,400 tons in 1937 compared with 15,532,000 tons in 1946. The total acreage planted to truck crops increased from 3,272,000 ac. in 1937, a record to that time, to 3,810,650 ac. in 1944. Production increased faster than did acreage because of increasing yield per ac. During the last five years of the decade, truck crop production amounted to 26% of all food crop production compared with an 18% average for the previous five years. The increase was greatest in the Pacific states and next in the west south central region, during the five-year period 1939-44. Measured by carlot shipments, fresh vegetables of all kinds increased during the decade 1937-46. In total volume, the potato crop was most important, lettuce second and onions third, closely followed by cabbage, tomatoes, carrots and celery.

Stocks of frozen vegetables in storage rose from 32,503,000 lb. on Dec. 1, 1937, to 195,509,000 lb. on the same date in 1943, reflecting the large reserves. The quick-freezing process increased to a high point in 1944, when a total of 257,767,000 lb. was frozen.

Vegetable production, particularly potatoes, was the first form of food production to be restored in the countries devastated by World War II. Gardens were planted to beans and potatoes as fast as the land and seeds were available, since these crops required the minimum of machinery and fertilizers. Beans and potatoes became the staff of life in many areas in Italy and Germany after hostilities ceased, particularly in rural areas not reached by relief supplies. Vegetables furnished a palatable supplement to the types of foods provided by the United Nations Relief and Rehabilitation administration and other agencies. The supplies in the cities were generally low because of the lack of transport, on farms, and on railroads and boats.

Truck Crops for the Fresh Market.-The acreage of U.S. vegetables grown for sale fresh expanded from 1,710,-340 ac. in 1937 to 1,872,720 ac. in 1944. Production was 6,294,000 tons in 1937 and rose to a record of 7,859,000 tons in 1944, to be exceeded by 8,446,000 tons in 1945 and an even greater crop in 1946. The output in 1945 was 30% more than the ten-year average 1934-43. The aggregate value of 25 commercial truck crops for sale fresh exceeded \$625,000,000 in 1945 and compared with a total value of \$212,881,000 in 1937. The strong consumer buying demand supported by high wages kept the markets firm in the face of the increasing volume of shipments. The per capita consumption of fresh vegetables increased for almost all kinds during World War II. The greatest increases were in tomatoes and green vegetables. The estimated per capita civilian consumption of all vegetables (excluding potatoes and dry beans) was 235 lb. in 1937, 254 lb. in 1944 and about 260 lb. in 1946.

Truck Crops for Processing.-Acreage of crops grown for processing expanded faster than did the area grown for sale fresh. This was due to the war demand for food in portable form as well as to the expansion of yeararound consumption. From 1,562,470 ac. in 1937 the acreage expanded to 1,937,930 in 1944, followed by a decline in 1945 and 1946. The production was 3,835,500 tons in 1937 and increased to a high of 5,817,900 tons in 1942. Average prices of crops for processing advanced steadily and reached a top in 1945. The total pack of canned vegetables more than doubled, from 96,122,000 cases in 1939 to about 227,000,000 cases in 1946. The most notable increases were in tomato juice, spinach, green beans, carrots and peas. The pack of frozen vegetables expanded greatly during the decade, from about 85,000,000 lb. in 1937 to 272,000,000 lb. in 1945. Cold storage stocks of frozen vegetables were only 32,503,000 lb. in 1937 and about 200,000,000 lb. in 1946. The output of dehydrated vegetables rose to a record of 196,000,000 lb. in 1945 and then dropped quickly when the military demand declined. Civilians did not use these products to any great extent except in the form of soup mixtures and seasonings. It was doubtful that they could compete with the fresh product, except for export. In 1944 the amounts produced of the several vegetables were as follows: potatoes 132,012,000 lb.; onions 18,830,000 lb.; sweet potatoes 13,699,000 lb.; carrots 13,655,000 lb.; cabbage 7,333,000 lb.; beets 6,832,000 lb.; and rutabagas 1,801,000 lb. The quickfreeze processes were being rapidly adapted to retail marketing through stores and promised to take a larger proportion of the product prepared at the point of production.

Production of Individual Vegetables.—Artichokes.—Acreage planted to artichokes was expanded to more than 10,600 ac. in 1940, but the yield was lower than in the previous decade. Production of artichokes was 808,000 boxes in 1937 and about 700,000 boxes in 1946. The

acreage declined steadily after 1940 to about 6,000 ac. in 1946. Prices fluctuated widely from \$1.60 per box in 1937 up to \$3.25 per box in 1944 and \$4.16 in 1946. Artichokes did not gain much in popularity during the decade 1937–46.

Asparagus.—Production of asparagus for sale fresh (only about one-eighth of the total crop) amounted to 6,553,000 crates in 1937. The acreage increased from 67,170 ac. in 1937 to 92,260 ac. in 1941, then declined to 77,000 ac. in 1946. The yield steadily increased, however, bringing the total crop for 1943 to the record of 9,880,000 crates, followed by a slight drop to 9,414,000 crates in 1946. This crop showed a remarkable stability in price, which advanced steadily after 1937, when growers received an average of \$1.42 per crate, to 1945, when the price averaged \$2.36 per crate.

The crop for processing, chiefly canning, changed less during the decade. The high record had been made in 1929, when production was 66,790 tons. The acreage increased after that year, but the yield was not so good, and the crop of 1937 was only 51,190 tons. By 1941 it had declined to 37,970 tons but then recovered to 63,-960 tons in 1946. The shortage of labour for harvesting was a factor in holding the crop in check during the war years. Considerable quantities of asparagus were frozen. The commercial crop continued to be grown chiefly in California, which produced about one-third of the total, New Jersey, producing one-sixth, and the rest widely scattered from the early areas in South Carolina to the late in Michigan. The pack of canned asparagus rose steadily from about 3,000,000 cases in 1937 to 4,300,000 cases in 1944 and then declined slightly. More than 13,256,000 lb. were frozen in 1944.

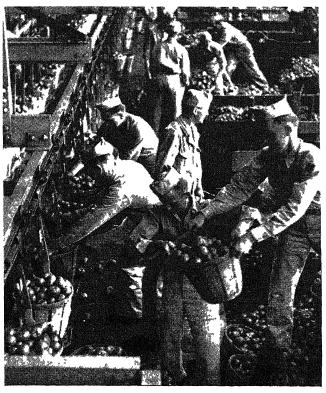

Beans, Lima.—For sale fresh, lima beans amounted to only about a third of the total crop of this vegetable after 1937. In that year the crop was 998,000 bu., or about the average of the previous ten years. The acreage increased until 1941, when the crop was 1,531,000 bu., followed by a slight decline. Prices rose from the low of \$1.30 per bu. in 1939 to \$2.92 per bushel in 1944, then declined. The larger crop of these beans grown for processing was sometimes drawn upon for fresh marketing when prices were high. Home garden production competed with the commercial crop because of deterioration in shipping. The winter crop from Florida continued to bring a price to growers about twice the season's average. In 1944 this price averaged \$5.10 per bu. The midseason crop from Georgia and South Carolina averaged \$3.34, and the late crop brought \$2.29 on the average. The bulk of the crop for processing continued to be grown in the north Atlantic and central states and on the Pacific coast. The acreage grown for processing in 1937 was 42,400 ac., compared with 17,950 ac. harvested for sale fresh. This was the largest acreage on record up to that time. The total acreage increased to a peak of 87,130 in 1941 then declined as labour became scarce. By 1946, the acreage was again at a new high of 90,650 ac. The latter gain was chiefly in the crop for processing; the fresh crop had declined to a total less than that of 1937. This crop was widely grown, with New Jersey leading, California second and Delaware next in order. The output of canned lima beans was 1,512,000 cases in 1937; it rose to 2,600,-000 cases in 1942 before declining to about the same level as in 1937. The frozen lima output in 1944 reached a high total of 37,051,000 lb.

Beans, Snap.—Snap beans continued to be widely distributed, produced in many states from the earliest areas of Florida to New York and Michigan. The total acreage

of green snap beans grown for both fresh sale and processing increased at a remarkable rate, from 221,620 ac. in 1937 to more than 340,000 ac. in 1943; thereafter it declined to about 300,000 ac. in 1946. The acreage for sale fresh was more than twice that grown for canning in 1937 but the processing demand increased much faster and was almost half the total in 1943, a record year. Prices for the fresh sales were at the low point of 82 cents per bu. in 1938 and at \$2.28 for the two high years, 1943 and 1944. For processing the price per ton advanced from the low point of \$42.27 per ton to \$95.37 in 1944, followed by a decline in 1945 and 1946. The leaders of the 30 odd states growing the crop were Oregon, New York, Arkansas, Florida, Maryland, Texas and Wisconsin. The two parts of the crop are interchangeable so that a surplus for one purpose can be shifted to the other use. Support prices were set to reflect about \$91 per ton, and the averages for 1943 and 1944 were \$93.69 and \$95.37 per ton respectively. The larger crops of beans went into cans in increasing totals from 1937 on. Up to 1936, the snap bean pack had averaged about 6,000,000 cases of 24 No. 2 cans each. In 1937, the total jumped to 10,052,000 cases, then was smaller in 1939 and 1940 and made a new high record of 24,000,000 cases in 1942. Subsequently, the total dropped back to 18,000,000 cases. This was the biggest increase of any green vegetable. The total of all green beans frozen amounted to 23,260,000 lb. in 1944.

Beets.—The total production of beets doubled from an average of 122,500 tons in 1933–42 to 249,300 tons in 1944, then declined to 1946. In 1937, the acreage grown for the fresh market was almost as large as that planted to the crop for processing, 10,630 ac. compared with 12,450 ac.; but processing expanded much more rapidly during the war years. Production of beets for fresh sale was but

Tomatoes being unloaded at a New Jersey cannery with the help of soldiers on furlough from nearby Fort Dix in Aug. 1943

little larger in 1945 than in 1937, but the crop for processing increased from 70,800 tons to 184,000 tons in 1944 and 186,700 tons in 1945. Prices of fresh beets advanced from an average of 52 cents per bushel in 1937 to 62 cents in 1942. In 1943, a smaller crop brought \$1.21 per bu., and in 1946 the price was down to 80 cents per bu. More than half the fresh crop was grown in Texas, with Pennsylvania and New Jersey following. The crop for processing was grown chiefly in New York, Wisconsin, Oregon, New Jersey and Michigan. More than 3,210,000 cases of beets were canned in 1937; the yearly output continued to increase until a record of 8,700,000 cases was packed in 1944. About 6,832,000 lb. were dehydrated at the peak of drying in 1944.

Cabbage.-The total production of cabbage increased during the decade 1937-46 principally during the last year of World War II. The total acreage rose from an average of 179,710 ac. in 1943 to 235,950 ac. in 1944. Production at the same time increased from 1,220,300 tons to 1,508,500 tons. Most of the crop continued to be grown for the fresh market, the part used for sauerkraut being only 107,400 tons in 1943 compared with a total of 117,900 tons in 1944. Only once before 1937 had the crop been so large. In 1945 the total crop was 1,582,000 tons, due to a large acreage and a fairly good yield, stimulated by a high price in the previous year. The price of cabbage rose from the lowest in ten years in 1938, \$9.26 per ton, to a top of \$47.54 in 1943. Cabbage prices fluctuated from year to year as the production varied. Prices also fluctuated from month to month in the shipping season. The government supported the market at various times by purchases. Stocks in storage ranged from a top of 78,020 tons in 1939 down to 25,700 tons in 1944. Average prices paid in the fresh market were regularly about twice those paid for stock for sauerkraut. The cabbage crop continued to be widely grown, from Texas to Wisconsin and New York. Most of the sauerkraut was made in New York, Wisconsin and Ohio, which three states accounted for about 80% of the production. New York also produced most of the early fall Danish type. Texas and Florida grew the winter crop, and Tennessee the late spring supply.

Cantaloupes and Other Small Melons.-The crops of the various melons were not regarded as a vital war food, and production declined sharply in 1942 and 1943 to the smallest total for 15 years. In 1931 the crop had been 14,412,000 crates; by 1937 it was down to the average of several years, about 11,931,000 crates. By 1943, the total had dropped to 9,311,000 crates, but it recovered to 12,-009,000 crates in 1945. Prices were stable from 1937 to 1941 at around \$1.06 per crate, then increased to \$2.60 in 1944. California continued to be the leading state of small melon production, growing about half the total crop. Arizona came into second place, with Colorado third. The rest of the crop was grown in widely scattered states. The production of honeyball melons, mostly in California and Arizona, declined steadily from 1,165,000 crates in 1931 to only 172,000 crates in 1944, followed by a slight recovery in 1945-46. Honeydew melons also declined after 1932, from 4,957,000 crates to 2,126,000 crates in 1942, but recovered to more than 4,000,000 crates again in 1945-46. This crop was also grown chiefly in California and Arizona. Production of Persian melons increased at a slow rate because of the problems of shipping this perishable form.

Carrots.—The acreage of carrots harvested grew steadily from 1937 to 1943, then declined slightly. The production

reached a record total of 29,944,000 bu. In 1943, as compared with 14,822,000 bu. produced in 1937. Fewer carrots were used for processing than other vegetables, but the amount canned increased from 949,000 cases in 1937 to 3,000,000 cases in 1944. About 20,418,000 lb. were dehydrated in 1943, the year of most extensive drying. Only small quantities were frozen. Prices of carrots were remarkably stable. The average annual price received by farmers advanced from 59 cents per bushel in 1938 to \$1.37 in 1944 and \$1.50 in 1946. The early crop continued to be grown in Texas and California, which also produced nearly half of the fall crop.

Cauliflower.—This crop held its place through the decade 1937–46 with an expansion much smaller than that of other vegetables. Acreage in 1937 was 29,470; it rose to 32,230 ac. in 1942 and then to 36,900 ac. in 1945. Total production increased from 8,677,000 bu. in 1937 to 11,640,000 bu. in 1945. The average price was 81 cents per bu. during 1934–43 and \$1.54 per bu. in 1945. Nearly half the crop was grown in California, particularly in winter and early spring. The summer crop continued to come from Colorado and New York. Very little cauliflower was processed. In 1944, 7,205,000 lb. were frozen.

Celery.—The U.S. production of celery increased less than that of other vegetables during the decade 1937–46. The areas harvested amounted to 40,180 ac. in 1937 and 40,690 ac. in 1944. Then followed a jump to 44,190 ac. From these areas the production was 15,185,000 crates in 1937, 18,040,000 crates in 1944 and 19,316,000 crates in 1945. The price was \$1.28 per crate in 1937, a top of \$3.24 in 1943 and \$3.20 in 1945. The early and spring crops, about one-third of the total, were grown in Florida and California, while Michigan and New York produced most of the fall crop. A good method of preserving celery was developed, and it was not processed. The culture of celery continued to be largely a commercial enterprise.

Corn, Sweet.-Sweet corn made a substantial gain during the decade 1937-46, particularly for processing. Production for the fresh market was reported for only three states. The average crops (1933-42) for these states were: New Jersey, 113,210,000 ears, New York 103,910,000 ears and Pennsylvania 51,012,000 ears, a total of 268,132,000. By 1945, these three states had increased their output to 314,810,000 ears. Small quantities of extra early corn were shipped from the south, but no carlot shipments were reported. The crop for processing increased from 978,100 tons in 1937 to 1,131,600 tons in 1945. The price rose from \$9.98 per ton in 1938 to \$19.30 per ton in 1945. The amount canned increased from 23,541,000 cases in 1937 to 32,000,000 cases in 1942, and then declined slightly. Corn was not dehydrated to any extent and only cutcorn was frozen. In 1944, 22,586,000 lb. of the latter was reported. An average of 11,714,000 lb. was reported held in cold storage on Dec. 1, 1940-44. More corn was canned than any other vegetable except peas and tomatoes. Large quantities were used by the military forces. Prices of crops for canning were supported by the government by contracts with canners, who passed on the support price to growers under contract. The yellow or bantam varieties became standard for canning, and more than seventy-five percent of the crop for processing in 1945 was of these varieties. (See also CORN.)

Cucumbers.—This crop is grown for the fresh market and for pickles; the fresh market crop usually amounts to about one-third of the total. In 1937 the fresh crop was 4,216,000 bu. and by 1945 had increased to 5,384,000 bu. For pickles, the crop was 7,761,000 bu. in 1937 and about 7,700,000 bu. in 1945. The acreage of cucumbers

declined during the decade from 153,100 ac. to 144,300 ac. in 1946. Prices for the fresh market increased from 80 cents per bu. in 1938 to \$2.48 in 1945, and for pickles from 59 cents per bu. to about \$2.00. The war demand was not sufficient to encourage production. The crop was widely grown, with the Florida and Texas crops coming to market early in the year, while New York, New Jersey and Maryland led in the summer production.

Eggplant.—Although the total production was not large (806,000 bu. in 1937 and 1,538,000 bu. in 1945) eggplant became established as a popular vegetable. Its production was largely limited to four states: Florida and Texas for the winter crop and Louisiana and New Jersey for the summer crop. Florida produced about half the total. The acreage devoted to this crop increased from 3,650 ac. in 1937 to 6,350 in 1945. At the same time, prices rose from an average of 83 cents per bu. 1934–43 to \$1.93 in 1945. No good method of preserving eggplant was developed.

Escarole.—Grown chiefly in Florida, escarole was introduced into Illinois and Indiana truck areas during the decade. In 1937, only 900 ac. were reported as the crop in Florida, with a production of 408,000 hampers. By 1945 the area was 2,800 ac. and the crop 865,000 hampers. Prices to producers increased from 45 cents per hamper in 1938 to \$2.15 in 1945.

Garlic.—The commercial crop of garlic from three states, California, Texas and Louisiana, declined from 4,250 ac. in 1937 to 3,400 ac. in 1944–46. The crop harvested was 187,000 sacks in 1937 and 177,000 sacks in 1945. The price in this period advanced from \$2.65 per hamper to \$18.25 the greatest increase of any vegetable. California produced about five-sixths of the crop and Texas and Louisiana the rest.

Kale.—For the fresh market, not including that grown for livestock pasture, kale increased from 1,300 ac. in 1937 to 2,350 ac. (mostly in Virginia) in 1944, a record year. The crop amounted to 533,000 bu. in 1937 and 822,000 bu. in 1944. The average price advanced relatively little, from an average of 39 cents per bu. during

Vegetables were grown in downtown areas of Tokyo levelled by Allied bombings, in an effort to increase food supplies after the close of World War II

1934-43 to 65 cents per bu. in 1945.

Lettuce.—This crop reflected the growing demand for salads by expanding from 20,740,000 crates production in 1937 to 29,767,000 crates in 1945. The acreage increased from 151,750 ac. in 1937 to 172,650 ac. in 1945. In 1945, the record year, lettuce was exceeded only by cabbage in volume of total production. (See Lettuce.)

Onions.—The commercial crop of onions declined after reaching a peak in 1936 of 34,688,000 sacks; only 29,974,000 sacks were produced in 1943. Acreage declined more than 40,000 ac. during this period. In 1944, the acreage was increased to a new high of 176,760 ac., and the crop harvested was also a record of 46,753,000 sacks. This big crop was followed by a reduction of nearly 38,000 ac. in the planting, and a crop of 36,137,000 sacks—less than the crop of 1942. Exports were large during the period 1939–41, then dropped to the average. The price of onions rose steadily from 66 cents per bu. in 1937 to \$1.67 per bu. in 1943, and then declined under the pressure of increasing supply. The big producing states were New York, Colorado, California and Texas, which together produced half the crop.

Peas, Green.—The production of green peas for sale fresh declined during the decade, particularly during the war years, but the crops for processing practically doubled. The fresh crop was grown on 111,470 ac. in 1937 with a yield of 8,687,000 bu., but the acreage dropped off to about 69,000 ac. in 1945 with a crop of 6,176,000 bu. The prices paid growers advanced during this period from \$1.14 per bu. in 1937 to \$2.52 in 1945. The crop of peas for processing reflected the demand for food for the war period and increased from 268,110 tons in 1937 to 490,150 tons in 1945. The cannery price rose from an average of \$54.69 per ton during 1934-43 to \$83.18 in 1945. Wisconsin, the leading state, produced 113,440 tons alone in 1944, which was far more than the other leading states (Washington 46,920 tons, Oregon 46,750 tons, New York 37,800 tons and Utah 24,070 tons.) These five states produced about two-thirds of the total crop. Canned peas were the most important canned vegetable. The canning of peas was increasing up to 1937, when 23,467,-000 cases were packed. By 1944 the total had reached 31,700,000 cases and continued to increase in 1945 and 1946. Peas were early found suitable for freezing, and by 1944 a total of 83,598,000 lb. was frozen. Peas were also held in cold storage in large quantities; average holdings on Dec. 1, 1940-44 were 40,000,000 lb., and in 1945 the total was 64,514,000 lb.

Peppers, Green.—Green peppers were grown on 20,600 ac. in 1937, and the area gradually expanded to 28,650 ac. in 1945. The production increased from 4,805,000 bu. in 1937 to 6,635,000 bu. in 1945. From 1941 to 1943 the crop was little larger than in 1937. Most of the crop was grown in Florida and New Jersey, with California and Texas next in order. Most was consumed fresh, as no good method of processing peppers had been developed.

Pimientos.—This crop increased very rapidly up to 1938 when the high record crop of 38,840 tons was harvested. Production then declined to 1944, when only 8,580 tons was produced. The 1945 crop was 12,470 tons. The culture of this crop was centred in a limited area in Georgia where seven-eighths of the crop is grown. California produces a small crop. The canning of pimientos reached a high peak in 1938 of 1,380,000 cases, then dropped year by year to only 200,000 cases in 1943, after which there was some recovery. The prices to growers averaged \$33.83 per

ton in 1934-43 and \$60 in 1945.

Potatoes.—See separate article.

Shallots.—This crop was nearly all grown in Louisiana, and increased in popularity until 1937, when a decline in both acreage and production began which lasted until 1944. The acreage was 6,000 ac. in 1937 and 4,000 ac. in 1944 but increased to 4,900 ac. in 1945. Production for the same years was 720,000 bu. in 1937, 339,000 bu. in 1944 and 609,000 bu. in 1945. The price per bu. to growers averaged 88 cents in 1934-43 and was up to \$2.37 in 1944 and \$1.66 in 1945.

Spinach.—Before 1937, the production of spinach for the fresh market was stabilized at about 14,000,000 bu. per year. The acreage and yield varied more than the harvested crop. In that period the amount processed, principally canned, varied from a peak of 96,900 tons in 1929 down to 20,500 tons in 1932 and averaged about 40,000 tons. In 1937, the acreage for sale fresh was up to 75,740 ac.-which was not equalled until 1943, when 73,350 ac. were harvested for the fresh market. The crop from this area was close to 14,400,000 bu. for the entire decade. The crop for processing was grown on 29,720 ac. in 1937; the area declined for a year or two, then recovered in 1942 to a record of 46,240 ac. returning a crop of 114,400 tons. Later crops averaged about 100,000 tons. Nearly half the fresh crop came from Texas, with California the next largest producer. Nearly half the processed crop came from California and the rest principally from Arkansas and Oklahoma, with smaller amounts from Texas, Virginia and Missouri. The pack of canned spinach increased from 2,892,000 cases in 1938 to 9,500,000 cases in 1942, and then declined slightly. In 1944, more than 34,000,000 lb. were frozen. An average of 9,422,000 lb. was kept in cold storage in 1940-44.

Tomatoes.—The growing production of tomatoes reflected the increasing demand for salads during the decade 1937-46. The total acreage planted to tomatoes increased from 654,060 ac. in 1937 to 824,070 ac. in 1945. At the same time the crop for sale fresh increased about 20% and that for processing more than 50%. The crop for fresh market declined after 1937 to 200,230 ac. in 1941 and then increased to 270,970 ac. in 1945. The crop harvested rose from 22,000,000 bu. to 32,975,000 bu. in 1945. Yields per ac. were very good during the war years. The price to growers trebled from \$1.07 per bu. in 1938 to \$3.38 per bu. in 1945. The imports of fresh tomatoes increased from 54,861,000 lb. in 1938 to 210,874,000 lb. in 1944. Most of this quantity was from Mexico and Cuba. Texas became the leading tomato state, with California a close second in 1944. The lower valley of Texas produced most of the early spring crop. Florida grew the winter crop that competed with the imported crop from Gulf countries. The main summer crop came from Maryland, New York and New Jersey. Tomatoes for processing were grown on 451,-000 ac. in 1937 and 553,100 ac. in 1945. The crop was 1,742,600 tons in 1938; a record crop of 3,169,900 tons was harvested in 1944. The crop declined in 1945 and this led the government to ask for an increase of 4% for 1946-the only increase among processing vegetables. The leading states in the output of tomatoes for processing were California, Indiana, Maryland, New Jersey, Pennsylvania and Ohio. The price of tomatoes for the factories averaged \$14.68 per ton during 1934-43 and \$27.22 in 1944, the good year.

Tomatoes are put up in three forms: whole tomatoes, pulp and juice. The output of whole canned tomatoes

averaged about 28,000,000 cases from 1937 to 1945, rising to 41,000,000 cases in one year, 1942. The pack of canned tomatoes dropped off to only 18,000,000 cases in 1945, the smallest since 1931. The output of tomato pulp was much smaller, but increased from 3,746,000 cases in 1937 to 9,500,000 cases in 1944. The production of tomato juice, which was very small before 1930, increased from 16,979,-000 cases in 1937 to 30,800,000 cases in 1944. The pack was almost 27,000,000 cases in 1945, second to the record of 1944. The shortage of labour encouraged the packing of juice rather than whole tomatoes.

Watermelons.-The production of watermelons appeared to be stabilized at around 65,000,000 melons from 1930 until the war period, when the crop dropped to 48,522,000 melons chiefly because of shipping difficulties. The acreage planted was about the same from 1937 to 1943, when it was cut from an average of 260,000 ac. to 142,600 ac. Large quantities of the crop were not harvested in some years when prices were low or shipping difficult. In 1938, more than 4,000,000 melons were lost and in 1940, 4,518,-000 were not harvested. Georgia continued to be the "watermelon state," with an output almost twice that of California or Florida. These three states produced more than 30,000,000 of the U.S. crop of 70,775,000 melons in 1944. The price per 1,000 melons ranged from \$106 in 1937 to \$411 in 1945. The volume of shipments was 32,470 cars of 1,000 melons each in 1937, and 34,590 cars in 1944. (See also Agriculture; Beans, Dry; Corn; Horticul-TURE; LETTUCE; POTATOES.) (J. C. Ms.)

Both great gains and great setbacks in the control of the venereal diseases occurred during the ten-year period 1937–46. The gains resulted from increased public education as to the threat of venereal diseases to public and individual health, heightened motivation to combat their spread and extraordinary advances in treatment methods and casefinding techniques. The setbacks were caused by the disruptive influence of World War II which in many areas, particularly the eastern hemisphere, obliterated the progress of decades.

World Incidence Trends.—Among the Scandinavian countries in which syphilis had been reduced to small dimensions by the time of the outbreak of World War II, the number of cases reported had increased eightfold in Denmark and sixfold in Norway by 1944; and even in Sweden, which was not invaded, the attack rate rose sharply after 1942.

In England and Wales, the number of new syphilitic infections under treatment by 1943 was more than double the number under treatment in 1939, but after 1941 the rate of increase fell off sharply.

On the continent, the incidence of syphilis increased markedly in many areas; although inadequate morbidity reporting made it impossible to measure changes in venereal disease rates, increases of twofold or more were not uncommon.

Reports from the orient a year after the end of the war indicated high venereal disease rates among many civilian populations.

In the western hemisphere established programs of control were not disrupted so greatly as elsewhere, and actual decreases in the incidence of syphilis were effected in some areas during the ten-year period 1937–46.

In the United States, the incidence of syphilis was cut in half during the 10-year period—from an estimated 500,-000 new cases per year in 1936 to an estimated 250,000 new cases in 1946. The number of deaths caused by all forms of syphilis declined steadily from 15 deaths per 100,000 population in 1939 to a new low estimated at 10.7 deaths per 100,000 population for 1945. The percentage of infant deaths caused by syphilis was reduced by more than one-half-from 57 deaths per 100,000 live births in 1939 to 25 per 100,000 in 1943. As reflected both in admissions to institutions and in recorded deaths, there was a steady decline in the incidence of late forms of neurosyphilis. In 1920 the national paresis death rate was 6.3 per 100,000 population; by 1943 this had been reduced by nearly half to 3.5 per 100,000. The tabes dorsalis death rate per 100,000, which was 2.1 in 1920, had dropped dramatically to 0.6 per 100,000 in 1943.

Credit for the fact that increases in the incidence of syphilis in the United States during the war were prevented, and that actual decreases in the attack rate were achieved in some areas, was shared by the armed forces, the selective service system, state and local health departments, the civilian medical profession, the U.S. public health service, the Social Protection division of the Federal Security agency, the Federal Works agency, the American Social Hygiene association, medical and laboratory research workers and many other public and private co-operating groups throughout the country.

During the war, the armed forces of the United States reduced venereal disease attack rates to record lows and by application of new treatment methods made notable reductions in the amount of time lost from duty because of venereal disease. After combat had ceased and occupation

begun, rises in venereal disease rates of the armed services were reported.

Much of the progress in the control of venereal disease was made possible by development and widespread application of new rapid methods for treating syphilis and gonorrhoea and by increased casefinding activities.

New Methods of Treatment.—Most significant single development in the entire field of venereal disease control was the application of penicillin therapy to both syphilis and gonorrhoea. The announcement in 1943 by J. F. Mahoney and his associates that penicillin had demonstrated spirocheticidal activity when administered to human patients precipitated a revolution in syphilis control and profoundly influenced both casefinding and treatment procedures. The fact was subsequently developed that administration of penicillin every few hours, day and night, along with small quantities of arsenic and bismuth, rendered a large majority of early cases of syphilis so treated noninfectious within a period of less than two weeks. Furthermore, in so far as could be determined within the period of follow-up up to 1946, the therapy apparently "cured" or arrested the progress of the disease. This development largely eliminated the problem of caseholding. Before the introduction of intensive inpatient treatment of syphilis, a substantial part of the effort and funds of health departments was devoted necessarily to the difficult problem of holding the patients to the schedule of 30 injections of arsenic and 40 injections of bismuth administered in a course of 70 weekly injections. Despite caseholding efforts, less than 25% of all patients brought to treatment under the 70week schedule were held long enough to assure the minimum protective therapy. In contrast, very nearly 100% of all patients hospitalized for intensive therapy completed the treatment.

The sudden liquidation of the caseholding problem freed an important part of the facilities of health departments for redirection toward an intensification of casefinding activities. Rapid treatment gave new impetus to finding patients infected with syphilis and bringing them to treatment.

Rapid Treatment of Syphilis.—Research in the rapid treatment of syphilis had begun as early as 1933 when H. T. Hyman, L. Chargin and W. Leifer introduced the method of administering large doses of arsenic over a short period of time by the intravenous drip procedure. Later, other rapid methods, including the administration of large doses of arsenic and bismuth over a short space of time by intravenous drip and multiple injections, and the inducing of fever, were used. In 1942 the first units of a nationwide system of rapid treatment centres for the administration of various intensive schedules of arsenotherapy requiring from one day to several weeks were established as a wartime emergency measure. The purpose was rapidly to render noninfectious persons to whom or from whom syphilis infections had been spread in areas with heavy concentrations of military and war industry personnel. By 1944, 63 rapid treatment centres had been established and had treated more than 25,000 cases of early syphilis by these methods. The advent of penicillin in the treatment of syphilis, however, and the availability of the drug in 1944 not only supplanted other methods of intensive treatment of syphilis but also afforded a sufficiently rapid turnover to permit hospitalization of all infectious cases of syphilis. During the fiscal year 1946, 120,000 cases of syphilis were treated-almost all of them with penicillinin rapid treatment facilities which had expanded to in-

clude beds in general hospitals. This represented one-third of all syphilis cases reported to state health departments for the fiscal year and, more important, represented a major portion of all early cases of syphilis treated.

In the latter part of 1945, it was realized that some changes had occurred in the proportions of the various chemical species of penicillin present in most commercial lots produced since 1944 which explained the observation that for a time the results of therapy were less satisfactory than previously. However, the difficulty was corrected promptly when manufacturing procedures were modified so that the therapeutically more effective fractions were present in larger proportions.

The ultimate efficacy of penicillin in the prevention of the late manifestations of syphilis remained to be determined, for the character of syphilis is such that a treatment cannot be regarded as fully established until many years of post treatment observation have passed. Nevertheless, the first three years of experience with penicillin indicated strongly that it was the most effective and safest antisyphilitic drug yet developed up to 1946 for the prevention of infectious relapse, and research was directed toward determining optimum time dosage schedules. The most practical and economical method of administering penicillin in the treatment of syphilis would be an outpatient procedure which could be conducted in the offices of physicians in private practice, or in clinics without the necessity for hospitalizing patients. The possibilities of such a procedure were being explored in 1946.

Treatment of Gonorrhoea.—Success in the treatment of gonorrhoea with penicillin was spectacular. In 1943 gonorrhoea was treated successfully with penicillin by W. E. Herrell, E. N. Cook and L. Thompson. The treatment required only a few days and, most important, was effective with patients who had not responded to treatment with the sulfonamides. Within a short time, penicillin had been demonstrated effective in the cure of more than 90% of all sulfa-resistant gonorrhoea cases in which it was used, and even those cases which did not respond to first courses of penicillin therapy were cured with second or third courses. The materialization of penicillin as effective in

the treatment of gonorrhoea was timely and fortunate; for the sulfa drugs, after a brief period of widespread usage, had declined disappointingly in effectiveness in gonorrhoea therapy as a result either of development of sulfonamide resistance by the gonococcus or the predominance of sullonamide-resistant strains. In 1944 M. J. Romansky and G. E. Rittman showed that a single intramuscular injection of penicillin in an oil-beeswax mixture was effective in the treatment of gonorrhoea. At about the same time C. J. Van Slyke and S. Steinberg had succeeded in reducing to three hours the time required for the treatment of gonorrhoea with aqueous penicillin solution given in four injections an hour apart. Later, treatment that could be completed within two hours was developed. These procedures largely eliminated the necessity for hospitalization of gonorrhoea patients and were readily applicable to office practice and outpatient clinic treatment.

As the use of these speedy methods of treating gonorrhoea with penicillin became widespread, a significant proportion of patients presumed to be infected with gonorrhoea failed to respond to penicillin therapy; but subsequent studies indicated strongly that the infections, if any, present in these apparent failures were not gonorrhoea infections, and thus apprehension that penicillin-resistant gonorrhoea was developing was largely dispelled.

The importance of penicillin in the control of gonorrhoea was parallel to its importance in the control of syphilis, for it made possible more emphasis on casefinding. It also made possible more active participation by physicians in private practice in the control of the disease.

New Era in Control.—The decade 1937-46 marked the end of a dark age of evasion during which the basic problems of venereal disease control in some parts of the world were obscured by euphemistic attitudes embodied in such phrases as "social diseases." In Sept. 1936 the first national conference on venereal disease control in the United States was conducted in Washington, D.C., and attended by leading health officers and physicians from all parts of the country. The president's greeting to the conference used the words "venereal diseases" for the first time in any presidential paper. Newspapers and magazines throughout the country began to abandon the "social disease" subterfuge and call syphilis and gonorrhoea by name.

Public response to the new campaign against venereal diseases led by Dr. Thomas Parran, surgeon general of the U.S. public health service, was immediate and widespread. Sampling polls conducted throughout the United States by the American Institute of Public Opinion showed that majorities ranging from 79% to 92% favoured vigorous public education, free public clinics, free blood tests, blood tests as prerequisites for marriage licences and adequate congressional appropriations for venereal disease control. Major voluntary organizations pressed for definite action to establish venereal disease control programs throughout the country. Among these were the General Federation of Women's Clubs, the Young Men's Christian association, the American Legion, the United States Junior Chamber of Commerce, the Lions International and many others. Voluntary campaigns were co-ordinated through the American Social Hygiene association.

LaFollette-Bulwinkle Bill.—The public will to combat the venereal diseases was implemented by congress in 1938, when the LaFollette-Bulwinkle bill was passed unanimously by both houses and was approved by the president on May 24. This act of congress authorized as a national policy grants-in-aid to the states sufficient for the establishment and maintenance of "adequate measures for the prevention, treatment, and control of the venereal diseases."

Table I shows the enlargement of venereal disease activity and progress which was possible after passage of the LaFollette-Bulwinkle bill.

Wartime Control Measures.—The second National Venereal Disease Control conference was conducted in Oct. 1942 at Hot Springs, Ark. by the U.S. public health service in co-operation with the American Neisserian Medical society. The conference was attended by federal, state and local health officers, by physicians in private practice and by the venereal disease control officers of the armed services. The conference considered means of meeting the wartime venereal disease control problem.

The mobilization of the military forces, together with the marked increase in industrial and defense activities, introduced numerous problems which required an intensification of the venereal disease control program.

In 1940 the army, the navy, the U.S. public health service and private health and welfare agencies formulated an effective co-operative wartime venereal disease control program which subsequently was adopted by a conference of state and territorial health officers. The program, stated in a document known as the "Eight Point Agreement" provided:

(1.) Early diagnosis and medical treatment by the army and the navy of enlisted personnel infected with venereal diseases.

(2.) Early diagnosis and treatment of infected civilians by local health departments.

(3.) Reporting by medical officers of the army and navy to state or local health authorities of information regarding possible source or spread of infections.

(4.) Reporting to medical officers of the army and the navy by civilian health authorities of contacts of enlisted men with infected civilians.

(5.) Isolation of recalcitrant infected persons with communicable syphilis or gonorrhoea during the period of communicability.

(6.) Repression of commercialized and clandestine prostitution.

(7.) Aggressive education among enlisted personnel and civilians regarding dangers of, prevention of and treatment of venereal diseases.

(8.) Co-operation of social hygiene and other voluntary organizations with official agencies in stimulating public support for the program.

In order to facilitate carrying out the provisions of the sixth point in the agreement, the federal security administrator in 1941 established the Social Protection section of

the Office of Defense Health and Welfare Services. In 1943 the unit was designated as the Division of Social Protection of the Office of Community War Services, and it functioned until the beginning of the fiscal year 1947.

During the war, prostitution was repressed effectively in more than 700 communities throughout the United States. The Social Protection division assisted in developing techniques in law enforcement and in encouraging self-policing policies by business interests, such as owners and operators of hotels and rooming houses, bars and taverns, which decreased opportunities for soliciting for prostitution.

In 1941 congress passed the May act. The purpose of this act was "to prohibit prostitution within such reasonable distance of military and/or naval establishments as the Secretary of War and/or Navy shall determine to be needful to the efficiency and health and welfare of the Army and/or Navy." In May 1946 the May act was amended and retained as a law. The essential provisions of the eight-point wartime agreement were reaffirmed in 1946 by all groups adhering to the original version and by the treasury department, to whose jurisdiction the coast guard had been returned.

International Control.—During World War II, international co-operation in venereal disease control continued among many nations, particularly in the western hemisphere, despite disruptive circumstances.

International co-operation consisted largely of exchange of information regarding source and spread of infections. In North America, Canada and the United States systematically exchanged epidemiologic data. Mexico and the United States co-operated in venereal disease control through the United States-Mexico Border Public Health association. Similarly, the United States exchanged epidemiologic data with other nations in the western hemisphere; and most of the other American republics participated in co-operation in venereal disease control through the work of the Pan American Sanitary bureau, the co-operative health services of the individual republics and the American Social Hygiene association.

During the war, the United States public health service developed a system for forwarding to appropriate health agencies throughout the world the names and addresses of persons reported as contacts of infected patients under health jurisdictions of the United States.

Medical information as well as epidemiologic data was exchanged among health authorities of different countries. The venereal disease division of the U.S. public health service made freely available to physicians and health agencies of other nations information regarding new treatment methods used in the United States.

Delegates from many countries attended the National Conference on Postwar Venereal Disease Control conducted in St. Louis, Mo., in Nov. 1944, under the auspices of the venereal disease division of the U.S. public health service. The increasing need for greater international cooperation in venereal disease control was stressed by delegates from many countries attending the conference.

Selective Service's Casefinding Program.—The greatest mass syphilis casefinding mechanism in the history of venereal disease control in the United States was a cooperative program conducted by the selective service system, state and local health departments and the U.S. public health service. This program comprised blood tests as part of the general physical examinations given selective service registrants; registrants with positive test results were followed up by state and local health departments for fur-

ther diagnosis and treatment if necessary. Among the first 15,000,000 registrants examined, 720,000 men with serologic evidence of syphilis were discovered. Of these, approximately 273,000 after follow-up and treatment were made available for induction into the armed services unless

otherwise disqualified.

The selective service routine blood-testing procedure in conjunction with data from surveys conducted throughout the country made it possible to estimate the total prevalence of syphilis among the entire population of the United States—approximately 3,200,000 cases.

The rate of prevalence based on positive and doubtful blood tests among the selectees examined was 45.3 per 1,000. The rate of prevalence for the entire male population of the United States between the ages of 21 and 35 was estimated to be 47.7 per 1,000.

The rate of prevalence among Negro selectees was 252.3 per 1,000, among white selectees 17.4 per 1,000. The estimated rate of prevalence for the entire male Negro population aged 21-35 was 272 per 1,000, for the entire male white population 23.5 per 1,000.

The rate of prevalence among selectees from rural areas was 43.8 per 1,000, from urban areas 46.1 per 1,000. The estimated rate of prevalence among the entire male population aged 21-35 in rural areas was 49.4 per 1,000, in urban areas 46.5 per 1,000.

Highest prevalence rates (white and Negro) were found in the southeastern states, the lowest in the New England, west north central and middle Atlantic states. The prevalence rates among males 21–35 years old for states in which data were available, and for U.S. census divisions and for regions are shown in Table II. Rates by age groups are shown in Table III.

Armed Forces Blood-Testing Separation Program.—Of importance comparable to that of the selective service blood-testing

and follow-up program was the co-operative program in which the army, navy and coast guard blood-tested for syphilis all members being separated from the services. Arrangements were made whereby all separatees with positive results to the serologic test for syphilis were re-

ferred to appropriate rapid treatment centres or state or local health departments for follow-up observation. During the period of most rapid demobilization, the public health service provided interviewers at all army separation centres and the larger separation points who interviewed separated soldiers with positive or doubtful results to the serologic test for syphilis and who referred them or provided transportation to the nearest rapid treatment centre.

Community-Wide Casefinding.—In 1945 a new mass method of venereal disease casefinding was introduced in the United States, in which virtually entire populations of whole cities and counties were persuaded by intensive programs of public information and education to appear voluntarily at designated stations for physical examinations for venereal disease or for blood serologic tests for syphilis.

This method was applied in a series of 45-day demonstrations conducted by state and local health departments, with medical societies, and the U.S. public health service co-operating. Paid newspaper, radio, billboard, car-card, motion picture theatre, sound truck and other forms of advertising were used to inform the people of the prevalence, dangers, symptoms and cure of the venereal diseases and to urge persons in susceptible age groups to report for diagnosis and treatment if necessary.

The first of the series of demonstrations was conducted in New Orleans, La., from March 13 to April 30 and resulted in 3.953 new cases of gonorrhoea being discovered and brought to treatment. Approximately 40% were treated by 152 physicians in private practice and the remaining 60% were treated in clinics. Penicillin was provided to both private physicians and clinics. The New Orleans campaign brought to treatment in 45 days more cases of gonorrhoea than the total number of cases reported in that city during the 2 preceding years.

The second demonstration was conducted in Birmingham, Ala., from May 15 to June 30, 1945. A state law in Alabama passed in July 1943 required blood tests for all persons in the state between the ages of 15 and 50. During the Birmingham program, 87% of the population of Jefferson county in that age group were given blood tests, among whom 35,616 persons infected with venereal disease were found, including 32,655 infected with syphilis and 2,961 infected with gonorrhoea. More than 140 physicians in private practice co-operated in the Birmingham program.

Control in Industry.—In 1937 the venereal disease division of the U.S. public health service assigned a commissioned officer with special training in industrial hygiene to the work of furthering a program for the control of venereal disease in industry. By this time it was recognized that, since more than 40% of the population of the entire country was included in the nation's potential labour force, efforts to reduce venereal diseases among such a large portion of the population should favourably influence the trend of venereal disease rates throughout the entire population.

In 1942, the surgeon general of the U.S. public health service appointed an advisory committee on the control of venereal diseases in industry. The committee was composed of physicians representing the medical profession, the public health service, industrial physicians, the American Social Hygiene association, and others concerned with the problem. The committee, on Aug. 10, 1942, made a report which embodied its "Recommendations to State and Local Health Departments for a Venereal Disease Control Program in Industry." The specific objectives of the program recommended by the committee were: to find and treat venereal disease and to prevent its spread among in-

dustrial workers and their contacts; to develop employment policies fair to both employer and employee which would assure maximum utilization of available manpower; to co-ordinate community and industrial venereal disease control programs and to bring to employees and employers such additional benefits as improved physical condition of personnel, reduction of labour turnover, working days lost and compensation costs and increase of efficiency, production and earning power.

In 1945 the American Social Hygiene association intensified its efforts to assist state and local health officers, industries and labour and management groups in establishing programs for venereal disease control in industry. This work was conducted in co-operation with the industrial hygiene division and the venereal disease division of the U.S. public health service. By 1946 the principles of control recommended by the advisory committee had been endorsed by state and territorial health officers, leading labour unions, large industrial organizations and other groups, such as national chambers of commerce, industrial and trade associations; and active programs were being conducted in almost every state in the United States.

Premarital and Prenatal Examinations.—During the decade 1937–46, great progress was made under the leadership of the American Social Hygiene association, the medical profession, health officers and legislators in securing the enactment of state laws requiring premarital and prenatal examinations to aid in the control of the venereal diseases.

The first law requiring a premarital examination and blood test for syphilis of both partners had been passed in Connecticut in 1935. In 1937 five more states passed laws requiring a premarital examination. By 1946, 36 states had premarital examination laws; of these, 32 states and Hawaii required blood tests for syphilis of both prospective bride and groom before issuing a marriage licence. The states were: California, Colorado, Connecticut, Florida, Idaho, Illinois, Indiana, Iowa, Kentucky, Maine, Massachusetts, Michigan, Missouri, Nebraska, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Utah, Vermont, Virginia, West Virginia, Wisconsin and Wyoming. Alabama, Louisiana and Texas required an examination by a physician for venereal diseases or a medical certificate showing freedom from such diseases of grooms only. The state of Delaware prohibited marriage of persons infected with venereal diseases or required personal affidavit of freedom from such diseases but specified no examination. The 12 remaining states and the District of Columbia granted marriage licences without regard to possible venereal disease infection.

The first legislation requiring prenatal blood tests was passed in 1938 by New York, New Jersey and Rhode Island. By 1946 prenatal blood tests for syphilis were required in the territory of Hawaii and 35 states: Arizona, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Missouri, Montana, Nebraska, Nevada, New Jersey, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Utah, Vermont, Washington, West Virginia and Wyoming.

The value of state premarital and prenatal laws as health measures was indicated by estimates for 1946 which showed that under these laws more than 2,500,000 persons during the fiscal year were tested, among whom were 96,000 persons with positive blood serologic test results.

In 34 states with premarital laws, 1,689,000 blood tests were made of which 83,000 were positive. In the 35 states with prenatal laws, 957,000 tests were made of which 13,000 were positive.

Public Education.—By 1946 the principles of public education and of community action in venereal disease control had been well formulated on the basis of experience

gained during the preceding decade.

The Section on Education and Community Action, National Conference on Postwar Venereal Disease Control, in 1944 made public a comprehensive report and recommendations. The section made recommendations regarding family protection, welfare and social services, moral factors, social hygiene education, patient education, education in schools, training in professional schools, community organization and action, Negro participation, prevention of prostitution and promiscuity, functions of law enforcement agencies, legislation, courts, detention facilities and social protection.

In 1945 the U.S. public health service advisory committee on public education mailed to state health officers and large city health departments questionnaires relating to venereal disease education and conducted hearings to receive testimony of individuals competent in different phases of venereal disease control, education and social protection.

In Dec. 1945 a report to the surgeon general of the U.S. public health service embodying the advisory committee's recommendations was made public. The report was based largely on the national conference report, response to the questionnaires, testimony presented at the hearings and a 1944 report of the advisory committee pertaining to the use of radio and films for venereal disease informational purposes for the general public.

The advisory committee stated that it regarded the St. Louis report as the basis for a comprehensive and thorough study for the formation of a program for community action for venereal disease control and public education which are so closely interwoven as to be inseparable. Answers received to the questionnaires mailed to state and local health officers, summarized by the advisory committee, revealed the demand for:

(1.) Greater emphasis on venereal disease and social hygiene education in the control program.

(2.) Education directed largely to the population groups having the highest incidence classification (education of patients taken for granted).

(3.) Sustained, intensive, long-range education programs.
(4.) Aid for other agencies in conducting programs of education and community action.

(5.) A long-range, intensified venereal disease education program as part of a general health program.

(6.) Employment of full-time, qualified, health education personnel for community health education.

(7.) Providing this personnel by or through health departments.

(8.) Special assistance from the U.S. public health service in training locally employed health education personnel and providing increased advisory services in health education, information and community organization.

The advisory committee made recommendations for meeting the obvious great need for a large increase in trained personnel for health education, information and community work.

The committee also recommended that the U.S. public health service stimulate the production of films of high artistic, educational and moral merit suitable for showing to special groups as well as to the general public. It strongly urged that education of transients or "floating"

populations concerning the various aspects of venereal disease was essential to prevent infection and for casefunding; also, that special study should be given to more effective methods of conveying venereal disease education to urban and rural Negroes. Finally, the committee recommended that every effort be made to bring venereal disease education to industrial groups. (See also Milhary Medicine; Urology.)

Venezuela

A South American republic, Venezuela is bounded on the west, south, east, and north, respectively, by Colombia, Brazil, British Guiana and the Caribbean sea. Area: 346,-481 sq.mi.; pop. (1941 census): 3,951,371, including an estimated 100,600 "indigenous forest population," *i.e.*, Indians; pop. was estimated in 1942 to be 3,996,095, including 100,670 Indians and 23,320 Venezuelans living abroad. The bulk of the population is mestizo, with a considerable admixture of Negroes and mulattoes along the Caribbean coast. The capital is Caracas (1942 pop. est., 269,930, 1941 census pop. 269,030); other important cities (with 1941 census pop.) include Maracaibo (112,519), Valencia (53,938), Barquisimeto (54,176), San Cristóbal (31,344), Maracay (32,992), Cumaná (25,893), Ciudad Bolivar (19,789), Coro (18,962), Puerto Cabello (22,087), Carúpano (16,548).

The constitution of 1936 provided for the establishment of a federal republic with 20 states, with legislative power vested in a bicameral congress with a senate and a chamber of deputies, the senate including two members from each state, elected by the state legislatures for four-year terms, and the chamber 98 members, elected on a population basis. The presidential term was five years and the president (elected by congress) was ineligible immediately to succeed himself. Presidents during the decade 1937–46 included Gen. Eleázar López Contreras, 1935–May 9, 1941; Gen. Isaías Medina Angarita, May 9, 1941–Oct. 19, 1945; Rómulo Betancourt, Oct. 21, 1945 to date.

Retreat from Dictatorship.—Venezuelan development in 1937 continued to centre, as it had in 1936, around the efforts of Pres. Eleázar López Contreras to place the country on a relatively democratic basis (following the death of the dictator, Juan Vicente Gómez, on Dec. 17, 1935), and at the same time maintain internal stability. The government exiled a number of alleged communists during the year, and refused entrance to other persons previously

exiled. Several strikes were peaceably adjusted, in sharp contrast to the procedure under the Gómez dictatorship. The congress, in furtherance of the reform policy launched in 1936, enacted several laws for improvement of labour and agriculture and for the better control of foreign residents.

During 1938 Venezuela continued to be economically prosperous and politically stable. Governmental revenues increased and Pres. López Contreras was enabled to present to the congress on May 7 a far-reaching "three-year plan" for Venezuelan national development. The program provided for increased national production; a reduction in the cost of living; development of sanitation, education and population. Venezuela's foreign relations in 1938 were featured by a nonaggression treaty with Brazil signed Dec. 8, and active participation in the eighth Pan American conference at Lima, Peru, in December.

The United States and Venezuela reciprocally elevated their legations to embassies early in 1939. Long-protracted negotiations between the two governments for a reciprocal trade agreement were concluded Nov. 6, and the pact took effect Dec. 16; by its terms, Venezuela reduced import duties on important products bought from the United States, while the latter government cut in half its tariff on Venezuelan petroleum, although limiting importation through a quota system. Venezuela promptly declared its neutrality after the outbreak of World War II and took a prominent part and a keen interest (partly because of the country's closeness to the Panama canal) in the work of the first inter-American foreign ministers' conference at Panamá in September–October.

War Dislocations.—Venezuela was under some economic strain in 1940 because of the effect of World War II on its toreign markets, especially in the Scandinavian countries and the Netherlands. Exports, especially of petroleum, suffered a sharp decline, and the early wartime interruption of the petroleum refining industry in the Dutch islands of Aruba and Curaçao, off the Venezuelan coast, also affected the Venezuelan industry adversely inasmuch as most Venezuelan oil was exported directly to those islands for refining. The government established an Import Control commission in Oct. 1940 to regulate and license imports. Municipal and state elections in Nov. 1940 returned heavy majorities to the Bolivarian party, headed by Pres. López Contreras.

Half of the membership of the national chamber of deputies was renewed in a nation-wide election Jan. 30, 1941. The election was of more than ordinary importance because the new congress was scheduled to elect a successor to Pres. López Contreras. Although his original election had been for a seven-year term, expiring in 1943, López Contreras voluntarily decided to end his term in 1941; he had already rejected earlier suggestions that, owing to world uncertainties, he should avail himself of legal loopholes to accept a new term. The new congress was overwhelmingly in support of the president, but on April 5 López Contreras formally reiterated his determination not to accept re-election. The congress, therefore, on April 28, chose Gen. Isaías Medina Angarita, the incumbent minister of war, as the new president by a vote of 120 out of 137.

Medina Angarita President.—Pres. Medina Angarita took office on May 9, 1941, in the first free and open transfer of presidential power from one constitutional president to another in Venezuelan history. Medina Angarita declared in his inaugural address that it was his intention to continue the liberal program of his predecessor and to cooperate with the United States. Evidence of his democra-

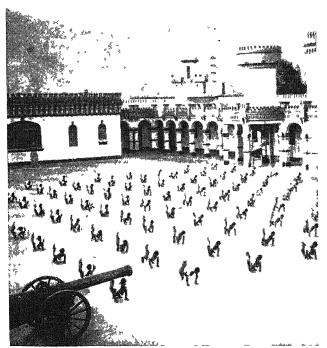

tic sincerity was revealed in September when his opponent for the presidency, the novelist Rómulo Gallegos, was allowed to form, without opposition from the government, a new party. the Acción Democrática, a group with slightly leftist leanings. This group for some time thereafter constituted the only formal party opposition to the administration party, to which both López Contreras and Medina Angarita belonged.

A hundred-year-old boundary dispute with Colombia was ended by direct negotiation in April 1941; this agreement called for improved commercial relations between the two republics and proved a forerunner for added *rap-prochement* in later years strengthening the sentimental ties which more than a century before had united Venezuela, Colombia and Ecuador in the single state of Great Colombia.

Upon the outbreak of war between the United States and the axis powers in December. Venezuela hastened to support the program of hemispheric solidarity. The government promptly took increased military precautions, opened Venezuelan ports to all American powers at war

Lowering the British flag during ceremonies making the formal cession of the tiny island of Patos, in the gulf of Paria near Trinidad, to Venezuela in Sept. 1942

Gymnastic drill for cadets on the parade grounds of the Escuela Militar, Venezuela

with the axis, and restricted radio communication to the Americas only. Venezuela on the last day of the year formally severed diplomatic relations with Germany, Italy and Japan. The record Venezuela had established with her lucrative petroleum royalties—of paying off her entire foreign debt—was broken in 1941 when wartime exigencies caused the government early in the year to borrow \$3,600,000 in the United States. The rising cost of living (previously the highest in Latin America) led the government to create a National Price Control board in 1941.

Venezuelan developments in 1942 were concerned chiefly with adjustment, both domestic and foreign, to a world at war. Foreign policy was directed toward the strengthening, both economically and politically, of relations with other South American states. At the third conference of American foreign ministers at Rio de Janeiro in the latter half of January, Venezuela was one of the strongest advocates of hemispheric solidarity against Germany, Japan and Italy; the Venezuelan delegation at Rio formed a part of the socalled severance bloc which worked for a unanimous break in axis diplomatic relations by all American republics.

Venezuela signed a commercial treaty with Argentina during the year and also negotiated seven modus vivendi agreements. A treaty with Great Britain gave Venezuela undisputed title to the small island of Patos in the Gulf of Paria and also defined the boundary line in that gulf between Venezuela and the British island of Trinidad. Venezuela and the United States concluded an agreement in 1942, to remain in force through Dec. 31, 1946, providing for U.S. purchase of Venezuelan rubber. The two governments also signed a lend-lease agreement March 18.

Internal developments in 1942 were characterized by determined efforts to decrease the country's dependence upon imported foodstuffs and manufactured goods. This had been a chronic problem because of the diversion of a

large part of the country's employment and economic energies to the service of the direct and indirect demands of the petroleum industry. A notable development of the year, consequently, was the increase and improvement of the government's emergency controls of prices, transportation and imports, initiated at the outbreak of World War II. The temporarily declining revenues from petroleum royalties led the congress to pass Venezuela's first income-tax law. A new civil code was also adopted during the year.

No change in general political policy took place during 1943, and the year proved to be relatively quiet. Elections held Jan. 19, 1943, resulted in the retention by Pres. Medina Angarita's administration of control of most of the seats in the congress. The most significant development of the year was the enactment on March 13 of a new petroleum law which provided that all companies and concessions be placed in an equal position under the law. Taxes were increased on surface lands, and some immunities from customs charges previously enjoyed by the companies were eliminated.

On April 15, 1943, Medina Angarita authorized the formation of a new political party, to be named the Partidários de la Política del Gobierno and designed to support the administration program. The move was partly in anticipation of the presidential election campaign of 1945, in which Medina Angarita stated that he would not be a candidate. The fact that only one opposition party had existed (the Acción Democrática, formed in 1941), led to the belief that conservatives might form another party for the forthcoming campaign. By inclusion of three men from liberal groups in cabinet appointments made in May, the administration was interpreted as moving toward the left.

In spite of shortages in many items of consumer goods, economic conditions continued relatively satisfactory in 1943, although the cost of living showed no tendency to decline; the latter index stood at 126.3 in Dec. 1943, as against 100 in 1938. The decrease in ship sinkings in the Caribbean in 1943 allowed a greater flow of goods to Venezuela, thus aiding retail trade. The government in Nov. 1943 blacklisted the so-called German railway; it became unable to operate, because of lack of fuel, and was taken over by the government Nov. 16.

Medina Angarita, at the invitation of the United States, made a visit to that country in Jan. 1944, during which he was received by Pres. Franklin D. Roosevelt at the White House on Jan. 19, and addressed the United States congress on Jan. 20. He conferred in New York with Henry J. Kaiser, and as a result three officials of the Kaiser interests went to Venezuela in March to survey postwar developmental possibilities. On March 28, Kaiser announced a three-point plan for Venezuela, including expansion and integration of the transportation system, development of hydroelectric power and gas resources and systematic mineral exploitation; certain aspects of these recommendations, especially the first part, were subsequently criticized in Venezuela. Andrew J. Higgins, New Orleans industrialist, made a trip to Venezuela in August and September for a study of similar problems.

As a consequence of a labour congress which was somewhat critical of the administration, the government on March 25, 1944, dissolved 109 workers' and farmers' groups on the charge of having included communists in their membership; some of these were later permitted to reopen after reorganization. The government began on April 19 to apply by decree a comprehensive and compulsory new social security law, designed to take effect gradually; it provided for insurance against undue financial loss as a consequence of sickness, maternity, industrial accidents and oc-

cupational diseases.

The government on Sept. 26, 1944, ordered the liquidation of six German and all Japanese firms operating in the country; this was accompanied by some slight manifestation of concern over axis economic strength in the republic, though axis minorities were not large (they were estimated at 3,000 Germans, in addition to 4,000 citizens of German descent, and 1,500 Italians, plus 1,500 citizens of Italian descent).

Diógenes Escalante, Venezuelan ambassador to the United States, proposed on July 18 that his country's frontier with British Guiana should be revised; this found some echo in Venezuela, but nothing tangible developed to revive the famous boundary controversy of 1895 and the years following. Domestic politics gained some attention in 1944, especially in view of partial congressional elections scheduled for Jan. 1945 and the anticipated beginning of the next presidential campaign later in that same year. Medina Angarita showed some tendency to align himself with labour elements instead of the military, from whose ranks he had come, a fact which undoubtedly led to his overthrow the following year. He proposed certain constitutional changes, including the direct election of deputies (they were currently elected by the councils of the municipal districts), the abolition of the ban on communist activities, woman suffrage in municipal elections and the federalization of the judiciary. Ex-Pres. López Contreras denied on Oct. 4 that he was associated with a proposed new party, that he was ambitious to be re-elected president at the end of the current term or that he opposed the Medina Angarita administration. Less discussion of the possibility of López Contreras as the "government candidate" was heard at the end of the year, however. The government on Nov. 17 announced the suppression of a small attempt at rebellion in a Caracas garrison.

Army Revolt.—The main event of 1945 was the October revolution which overthrew the administration of Pres. Medina Angarita. Revolt broke out in Caracas and the nearby military city of Maracay on Oct. 18, staged by the rank and file of the army, led by younger officers of or below the rank of major, and joined soon afterward by the liberal Acción Democrática party. After fierce fighting for three days, Medina Angarita was forced out and Dr. Rómulo Betancourt, 40-year-old lawyer and a leader of Acción Democrática, became provisional president. Casualties in the revolution were estimated at 300 killed and more than 1,000 wounded. The new regime was almost immediately granted diplomatic recognition by Cuba, Ecuador, Paraguay, and, on Oct. 30, by the United States; other governments extended recognition at about the same time. The provisional government announced that it would hold elections, as previously scheduled, in April 1946. It soon succeeded in restoring order, and apparently enjoyed popular support. Oil companies were reassured with regard to retention of their property. The revolt was allegedly caused by the belief of younger army officers that the election of Angel Biaggini, supposedly Pres. Medina Angarita's candidate as his own successor, would be engineered under any circumstances and the regime thus continued. Medina Angarita, ex-Pres. López Contreras and others were exiled to Miami, Fla. The new regime promised a new constitution within six months.

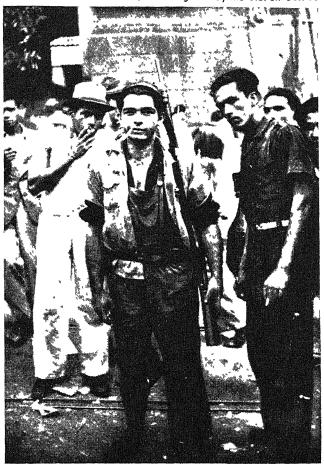

Congressional elections on Jan. 19, 1945, resulted in an overwhelming victory for the pro-administration Venezuelan Democratic party. The government on Feb. 15 declared belligerency against Germany and Japan; Ambassador Diógenes Escalante on Feb. 20 signed the United Nations pact at Washington. The government on April 6

announced plans for liberal monthly quotas for admission of Spanish Republicans and other immigrants. Some of the constitutional amendments which Medina Angarita had previously proposed—legalizing Communist party activity, granting women a municipal vote, etc.—became effective May 5.

Venezuela established diplomatic relations with the soviet union on March 13, 1945. At the United Nations conference at San Francisco, opening in April, Venezuela received the presidency of the judicial agency set up as one of the working committees to draft the United Nations charter. The government on May 25 announced the arrest of ten Germans charged with plotting to sabotage the oil fields and to blow up Allied tankers transporting fuel to Europe.

The revolutionary junta which had been in control of Venezuela since Oct. 1945, enacted a law on March 2, 1946, setting elections for 160 members of a new constituent assembly for Aug. 27; the elections were later postponed to Nov. 11. The long-standing state of siege was lifted March 15, 1946, and the government on the following day freed all political prisoners. Serious disturbances occurred within the next few days, however, between communists and police. Political lines appeared to be tightening between the conservatives and the liberal Acción Democrática (civilian spearhead of the 1945 revolution) on the one hand, and Acción Democrática and the communists on the other.

Participants in the military coup at Caracas, Venezuela, on Oct. 18–20, 1945, which overthrew the regime of Pres. Isolas Medina Angarita. A revolutionary junta, headed provisionally by Socialist leader Dr. Rómulo Betancourt, was recognized by the U.S. on Oct. 30

Vermiculite

Most of the development of fairly extensive use of vermiculite in the United States occurred in the period 1937–45, as is indicated by the following production data:

	Short tons	:	Short tons		Short tons
1937	25,556	1940	22,299	1943	46,645
1938	20,700	1941	23,438	1944	54,116
1939	21,174	1942	57,848	1945	64,808

Established uses prior to World War II included heat and sound insulation, both loose and as an admixture in

concrete and plaster, the latter forms also serving as a fire retardant and a weight reducer. Its colour and flaky lormation made vermiculite useful as an extender for aluminum and bionze paints. In petroleum-cracking units, it served as a combined refractory and insulator. A special war adaptation was in lightweight insulating concrete for deck covering and fireproof walls in oil tankers exposed to bombing attacks. Other adaptations were as a soil conditioner and as an absorbent for oil on shop floors.

(G. A. Ro.)

Vermont

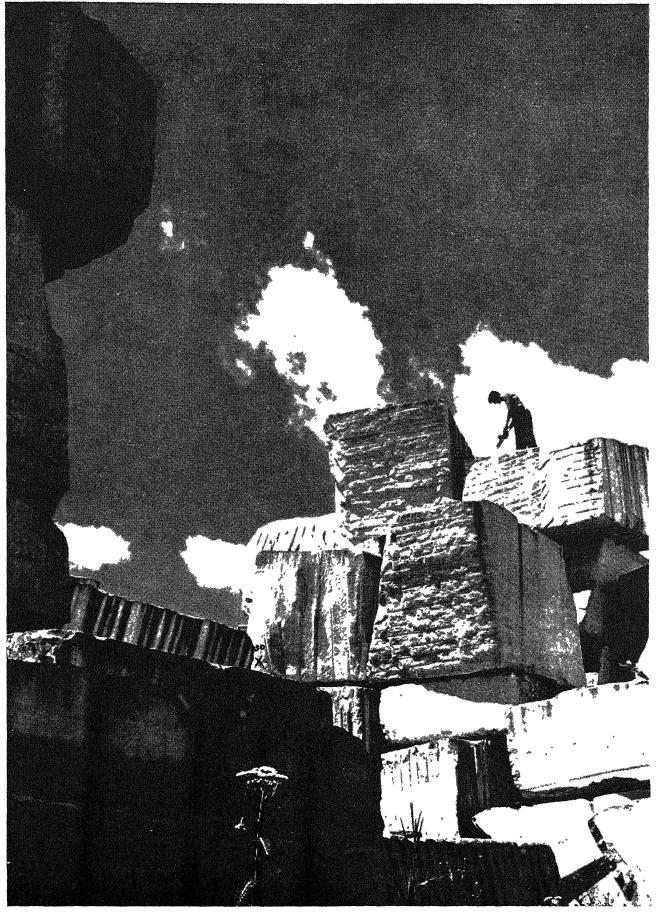

A north Atlantic state of the United States, Ver mont was admitted to the union in 1791, the first to be added to the original 13; popularly known as the "Green Mountain state." Area, 9,609 sq.mi., including 331 sq.mi. of water. The population in 1940 was 359,231, including 235,-992 rural, 123,239 urban. There were 327,079 native whites, 31,727 foreign-born, 384 Negro, 41 of other 1aces. On July 1, 1944, the U.S. census bureau estimated the population of the state at 310,041. Capital, Montpelier (8,006). The chief cities are Burlington (27,686), and Rutland (17,-082).

During 1937, Vermont passed an unemployment

compensation law and increased its old-age assistance from \$250,000 to \$475,000 annually. It also passed a number of bills bringing its crime legislation into harmony with that of other states, and entered into an interstate compact for flood control with neighbouring states. The state park system was expanded. An \$800,000 bridge was built across the northern end of Lake Champlain. The governor was George D. Aiken; William H. Wills, lieutenant governor; Rawson C. Myrick, secretary; Thomas H. Cave, treasurer.

During 1938, the important Rutland railroad, mid-state artery, went into the hands of a receivership. The New England hurricane of Sept. 1938 did much flood and wind damage to public and private property, particularly sugar orchards. The milk situation continued to occupy the attention of the extensive dairy interests, and the governor's committee made a revolutionary recommendation advocat-

Quarrying near Rutland, Vt., a source of much of the finest marble used in statuary and public buildings. Marble and granite continued to be leading mineral products in the state throughout the decade 1937–46

ing home uses of surplus milk that would yield an estimated \$1,000,000 more annually to Vermont farmers. The Winooski valley flood control project, begun in 1933, was virtually completed at a cost of \$15,000,000.

A total presidential vote of 143,044 was cast in the state in 1940; Willkie received 78,371; Roosevelt 64,269. William H. Wills was elected governor; Warren R. Austin and George D. Aiken, U.S. senators; Charles A. Plumley, representative to congress; Mortimer R. Proctor, lieutenant governor; Thomas H. Cave, treasurer; Rawson C. Myrick, secretary of state.

A special legislative session in 1941 granted a bonus of \$10 a month to its men in service, a sum which had been voted by a previous session in case the United Stațes went to war. During 1941 former Gov. George D. Aiken took his seat as U.S. senator from Vermont. Provision was made for a referendum on women jury service to be decided at the general elections in 1942.

The year 1942 was an off-year for the biennial sessions of the state legislature. The principal activities of the state centred around various phases of war work. A council of safety was set up, modelled on the original council of colonial days, to head up all the civilian defense work of the state. Gov. William H. Wills became the honorary chairman and Albert A. Cree, executive chairman. Vermont led the nation in the scrap metal drive and was among the leading states in the scrap rubber drive.

(L. W. D.; X.)

The state legislature in 1943 granted emergency powers to the governor, who in turn created the office of civilian defense and the council of safety. There were no changes in the constitution. Levi R. Kelley succeeded Thomas H. Cave as treasurer of the state.

A special session of the state legislature met in 1944. Bills were passed permitting members of the armed forces to vote. Other laws enacted or amended included those pertaining to flood control on the Connecticut river and benefits for veterans of World War II. The state vote for president of the United States was distributed as follows: Thomas E. Dewey, 71,527; Franklin D. Roosevelt, 53,820; others, 14. George D. Aiken was elected U.S. senator; Charles A. Plumley, representative to congress. State officers elected in the 1944 election were: Mortimer R. Proctor, governor; Lee E. Emerson, lieutenant governor; Levice, R. Kelley, state treasurer; Rawson C. Myrick, secretary of state. Requests for 7,855 ballots were received from members of the armed services, and 5,309 of these applicants voted in the November election.

In 1945, the state legislature met from Jan. 3 to April 18. Legislation enacted or amended included bills relating to the establishment of a minimum salary for teachers, provision for the regulation of air commerce, provision for standard nonforfeiture and valuation laws respecting life insurance and establishment of a state veterans' board.

Legislation enacted or amended in 1946 included bills relating to student housing at the Vermont Agricultural college, at Burlington, Vt., and public welfare. Elected in Nov. 1946, were Ralph E. Flanders, U.S. senator, and Charles A. Plumley, representative to congress. U.S. Senator-elect Ralph E. Flanders was appointed by Pres. Harry S. Truman to complete the unexpired term of Senator Warren R. Austin, who had been appointed U.S. delegate to the United Nations Security council. Chief state officers elected were: Ernest W. Gibson, Jr., governor; Lee E. Emerson, lieutenant governor; R. C. Myrick, secretary of state; and L. R. Kelley, state treasurer. (C. E. Fe.; X.)

Veterans' Administration

The Veterans' administration, an independent U.S. federal agency headed by an administrator of veterans' affairs, was established by an act of July 3, 1930, to unify the work of various federal bureaus administering direct benefits to veterans and their beneficiaries.

The beginning of the ten-year period 1937-46 found veterans, as a result of the business depression, increasingly concerned with having security of benefits assured. On that account, and in the interest of simplicity of administration, constant endeavour was made to evaluate disability on a permanent basis for pension purposes. Except for

former soldiers of the regular establishment, veterans of all wars other than World War I were in decreasing numbers receiving monetary benefits, while the World War I group continued to increase in number of beneficiaries with growing costs. The pressure of adverse economic conditions was also reflected in increasing hospitalization and domiciliary care.

The advancing age of about 4,000,000 World War I veterans, many with natural physical handicaps, and the resultant unemployment, also constituted a serious and progressive problem, especially because of the reluctance of commercial and industrial employers to hire older men. While the Veterans' administration did not itself maintain an employment service, it co-operated with the U.S. Employment service of the department of labor and other federal agencies in an effort to find work for veterans. Many men turned to the Civilian Conservation corps, established in 1933. Veterans' eligibility was determined by the Veterans' administration, and selectees were certified to the war department for enrolment in the corps. When CCC terminated at the close of the fiscal year ending June 30, 1942, there were still about 11,000 veterans on the rolls. Altogether, there were approximately 225,000 enrolments in the veterans' contingent after the start of the corps, and almost 600,000 veterans and their dependents had received direct monetary benefits through payments and allotments.

Period of Defense Build-up.-The national defense program brought new problems. The army was not fully prepared to meet the medical and hospital requirements of an enlarged force, so the Federal Board of Hospitalization adopted a plan approved by Pres. Franklin D. Roosevelt in Sept. 1940 that would utilize the highly trained medical staff and facilities of the Veterans' administration. This program provided that the additional requirements of the armed forces would be met by the Veterans' administration's relinquishing beds it had been using in army and navy hospitals and by addition, through new construction, of beds to existing hospital services; that temporary general hospital needs of the army and navy in manoeuvre areas would be met by the nearest general hospitals of the agency; and that in the event of a major national emergency the general facilities of the agency would be utilized for members of the armed forces who were injured or incurred disabilities in service and whose physical rehabilitation by the army was not feasible. The agency's legal obligation to provide hospitalization for members of the regular establishment discharged for service-incurred disabilities or in receipt of a pension, indicated the need for more beds through building construction.

The Selective Training and Service act of Sept. 16, 1940, was followed by public laws of Oct. 8 and 17, 1940, necessitating reorganization to handle the huge volume of insurance business brought about by these laws. During the first year, through Oct. 1941, more than 662,000 applications for national service life insurance, representing approximately \$2,285,000,000 of insurance, were received from persons in the armed forces, requiring immediate expansion of the insurance and finance services of the agency.

Even as the volume of work grew, considerable inroads were being made upon the personnel of the Veterans' administration to meet the needs of the armed forces.

War Duties.—The transition of the United States from a national defense to a war basis brought additional duties. Adequate authorities obtained or were promptly enacted to permit adjudication of war service claims for pension and insurance benefits and to afford hospitalization to dis-

charged veterans disabled in line of duty. World War II veterans were granted hospitalization, domiciliary care and burial benefits on a parity with World War I veterans, and provision was made for rehabilitation of World War II veterans.

As the Allied forces began to advance on the various battlefronts, greater consideration was given plans for the civil re-establishment of returning veterans. The result was the Servicemen's Readjustment act of June 22, 1944. The act in general applied to any World War II veteran discharged under conditions other than dishonourable after 90 or more days of service, or discharged by reason of an injury or disability incurred in line of duty. Broadly, within certain limitations, it provided: educational and vocational training aid; guarantee by the Veterans' administration of loans for purchase of homes or farms or for business purposes; payment of readjustment allowances to unemployed or self-employed veterans, and other benefits.

Demobilization.—The number of persons discharged from the U.S. armed forces rapidly increased with the surrender of the axis powers in 1945 and the ensuing demobilization. By Sept. 1, 1946, the number of veterans totalled 17,492,000, of whom 13,531,000 were those of World War II. To meet the tremendous increase in claims for direct benefits by World War II veterans more effectively and more promptly, the Veterans' administration decentralized in 1945. In addition to the central office in Washington, D.C., 13 branch offices, each under a deputy administrator, were established in various parts of the United States. Under the jurisdiction of the branch offices as of Aug. 31, 1946, there were 327 field stations (regional and subregional offices, hospitals, homes and centres) and 736 contact units. Offices were also established in Puerto Rico, Alaska, the Hawaiian Islands and the Philippine Islands. During this same period the number of full-time employees increased from 68,174 in Aug. 1945 to 177,930 in Aug. 1946. Of this latter number, 152,783 were employed in field offices. As of June 30, 1937, there had been 35,190 full-time employees on the rolls.

Medicine and Surgery.—The urgent need for rapid expansion of all medical services for veterans, as a result of World War II, prompted reorganization and creation of a department of medicine and surgery under a chief medical director in Jan. 1946. This bill authorized the administrator of veterans' affairs to employ without regard to the civil service Classification act of 1923, as amended, physicians, dentists, nurses and other professional and nonprofessional personnel at such pay rates as he prescribed. It likewise authorized the administrator to establish residencies for physicians in Veterans' administration hospitals and clinics. By June 30, 1946, 650 residents had been appointed. In conjunction with the physician-training program, 890 consultants of outstanding professional ability in their individual fields of medicine and dentistry had been appointed by June 30, 1946.

As of June 30, 1936, there were 80 Veterans' administration hospitals with a total of 45,873 beds and an additional 1,876 beds in other hospitals operated by federal agencies available through reciprocal agreements. Ten years later, June 30, 1946, there were 109 hospitals with 86,439 authorized beds and 12,669 beds allotted by other agencies, and about 8,000 beds for service-connected cases available through contracts with state and civil hospitals. Disbursements for construction of new hospitals and additions during the fiscal years 1937 through 1946 totalled \$95,852,310.68.

Of the total of 346,036 hospital admissions of veterans during the fiscal year 1946, 67.6% were World War II veterans, 28.9% World War I and 3.5% were veterans of other wars and men discharged or retired from all branches of the regular military services. General medical and surgical cases constituted 80.3% of total admissions, pulmonary tuberculosis cases 4.4% and neuropsychiatric, including neurological diseases and injuries 15.3%. Sixteen percent of all admissions were for disabilities that were service-connected, that is, directly or presumptively incurred in or aggravated by military service. Hospitals operated by the Veterans' administration accounted for 87% of the veterans admitted to hospitals in the fiscal year 1937, and only 75% of those admitted in 1946. Because of the greater need for additional hospital facilities during the year ending June 30, 1946, in which period the total veteran population was augmented by about 10,000,000 World War II veterans, there was an appreciable increase in the number of beds allocated by other federal agencies and beds contracted for in state and civil hospitals.

Discharges of veterans from hospitals during the fiscal year 1946 were 132.7% more than the 1937 total. General medical and surgical patients discharged in 1946 exceeded 1937 by 144.8%; neuropsychiatric discharges were 120.2% higher in 1946, and pulmonary tuberculosis discharges were 32.5% more than the 1937 total.

Of the 85,837 veterans under treatment in hospitals at the end of the fiscal year 1946, 32.4% had service-connected disabilities. There were 28,335 general medical and surgical patients, 13.2% of which were service-connected cases; 8,103 pulmonary tuberculosis patients, 46.2% service-connected; and 49,399 neuropsychiatric cases, 41.1% of which number were service-connected. Ten years earlier, at the beginning of the fiscal year 1937, there was a total of 41,542 U.S. veterans in hospitals, 28.1% service-connected cases; 12,556 general medical and surgical cases, 7.2% service-connected; 4.539 pulmonary tuberculosis cases, 23.7% service-connected; and 24,447 neuropsychiatric cases, 39.6% service-connected.

For admission to a Veterans' administration home, a patient was required to have a condition essentially chronic in character, not susceptible of cure or decided improvement by hospital treatment, and to be incapacitated from earning a living for a prospective period. As of June 30, 1946, there were 11 homes with a total capacity of 15,-292 beds; at the beginning of the fiscal year 1937 there were 12 homes with 18,756 beds. The greater need for hospital beds resulted in the conversion of some space into hospital wards, which accounted in part for the reduction of beds in homes. Veterans receiving home care on June 30, 1946, numbered 11,052. Admissions during the year totalled 14,056; World War II, 2,445; World War I 10,395; and all other veterans, 1,216. Ten years earlier there were 9,586 veterans in homes, of which 84% were World War I veterans.

Out-patient clinics in Veterans' administration hospitals

and regional offices continued to offer medical and dental services to veterans needing treatment for service-connected illness and injury not requiring hospitalization. In addition, medical and dental examinations continued to be made to determine the need for hospital care and for disability rating for pensions and for insurance purposes.

Out-patient medical and dental treatment for the year ending June 30, 1937, totalled 816,702 and 78,506 respectively. During the year ending June 30, 1946, there were 1,502,309 medical treatments and 160,400 dental treatments. The increase, of course, was due to the greater number of veterans to be served.

Insurance.—National service life insurance was authorized by the National Service Life Insurance act of 1940 for all members of the armed forces ordered to active duty for more than 30 days, in amounts of not less than \$1,000 or not more than \$10,000, in multiples of \$500. The passage of this law terminated the right of persons entering the armed forces after Oct. 8, 1940, to purchase U.S. government life insurance unless they otherwise were eligible as veterans of World War I.

All national service life insurance was written initially on the five-year level premium term plan with the right to convert to a permanent plan any time within the term period after the term policy has been in force for one year. On July 2, 1945, the term period was extended on all policies written before Jan. 1, 1946, for an additional period of three years at the same premium rate. All policy holders acquired the right to continue their insurance in force after discharge from active service.

The Insurance act of 1946 liberalized the provisions of the National Service Life Insurance act of 1940, as amended, to meet the needs and desires of veterans under peacetime conditions. Restrictions were removed from the choice of beneficiaries, three endowment plans were added to the ordinary life, 20-payment life and 30-payment life already authorized, provision was made for additional optional settlements and protection against total disability for six months or more was made available in a separate policy provision for an extra premium and compliance with health requirements.

The total number of applications for national service life insurance approved through Aug 31, 1946, was 18,915.869 for an aggregate amount of \$147,709,774,000 of insurance. As of the same date, there were in force under premium-paying conditions an estimated 6,195,000 policies for \$38,615,520,000 of insurance, an average of \$6,233 per policy. As a direct result of war casualties and other deaths of more than 369,000 insured lives up to and including Aug. 31, 1946, monthly instalments were being paid to beneficiaries on more than \$3,300,000,000 of insurance awarded on death claims to that date.

United States government life insurance, initially known as war risk insurance (World War I), was authorized by amendment to the War Risk Insurance act (1917) to enable those who served in the armed forces during World War I to purchase insurance from the government in amounts of not less than \$1,000 or more than \$10,000, in multiples of \$500. Approximately 4,500,000 persons applied for almost \$40,000,000,000 of war risk term insurance between Oct. 6, 1917, and Nov. 11, 1918. Under the provisions of the original act, conversion from term to permanent United States government life insurance could not be made until after the close of the war; consequently the first policy of this kind was granted in May 1919. As of Aug. 31, 1946, there were in force 547,470 United States government life insurance policies representing \$2,373,366,156 of insurance.

Article IV of the Soldiers' and Sailors' Civil Relief act of 1940, as amended, provided a method whereby the government under certain conditions, upon application by the insured, guaranteed commercial life insurance policies against lapse for the nonpayment of premiums while the insured was in active service and for two years after discharge under certain conditions. Through Aug 31, 1946, approved applications under article IV of the Civil Relief act totalled 89,048 for an amount of \$221,923,103 of life insurance—an average amount of \$2,492 per policy.

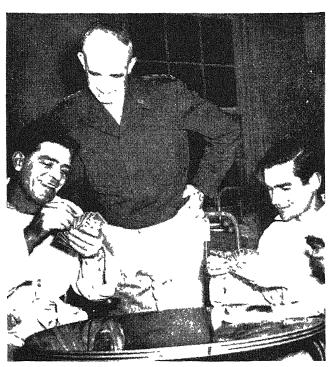

Pensions and Compensation.—Laws enacted during the period 1937–46 considerably increased the rates of pension and compensation and liberalized the conditions of entitlement to permit the allowance of these benefits to additional classes of dependents. At the close of the ten-year period, death pensions and compensation were being paid to the widows, children and dependent parents of veterans who served in the Mexican, Civil and Indian Wars, as well as the Spanish-American War, Boxer Rebellion, Philippine Insurrection and World Wars I and II, and in addition to the dependents of those who served during peacetime.

As of June 30, 1946, 36% of the death pension and compensation benefits being paid were based on World War II service, while 42% were for World War I service, 3% for peacetime service and the balance, 19%, for service rendered during the Spanish-American War and prior wars.

Disbursements for compensation and pension from July 1, 1945, to June 30, 1946, totalled \$1,260,000,000, of which \$733,000,000 was for World War II service, \$346,000,000 for World War I service, \$24,000,000 for service in the regular establishment and \$157,000,000 for service in the Spanish-American War and previous wars. Of the \$733.000,000 for World War II, \$698,000,000 was for service-connected cases. On June 30, 1946, pensions at the average monthly rate of \$54.90 were being paid to the dependents of 180,938 deceased veterans of World War II.

Education and Training.-Two public laws provided for education and training of World War II veterans. Public Law No. 16, 78th congress, as amended by Public Laws Nos. 346, 78th congress, and 268, 79th congress, provided for eligible disabled veterans with handicaps removable by training with the purpose of restoring employability. Title II of the Servicemen's Readjustment act of 1944 (the "G.I. Bill of Rights") provided for eligible nondisabled veterans. The latter law directed the Veterans' administration to furnish guidance to veterans in educational and vocational matters, but recognized supervision of training of students studying under the law as the function of the state institutions. Under the Readjustment act, the period of education or training to which a nondisabled veteran was eligible was determined in part by his length of wartime military service, with the maximum four years. The disabled veteran eligible for vocational rehabilitation could receive a suitable course possibly extending for four years, or for a longer period, if necessary and approved by the Veterans' administration.

As of June 30, 1946, 413,613 veterans had applied for vocational rehabilitation training; 92,213 were in training; 28,253 had interrupted training; and 2,659 had been rehabilitated.

Gen. Omar Bradley visiting convalescents at a veterans' hospital in New York city. Gen. Bradley took office as administrator of veterans affairs on Aug. 15, 1945

Of the number in training, 52,150 were in training in educational institutions and 40,063 were in training on the job.

Of the number in training in educational institutions, 34,226 were in professional, technical and managerial courses; 5,521 were in clerical and sales courses; 970 were in training for service occupations; 1,386 were in agricultural and kindred courses; and 10,047 were in trade and industrial courses.

As of June 30, 1946, 2,924,115 veterans had applied for education or training; 930,512 were in training; 234,181 had interrupted training, and 985 had exhausted their entitlement.

Of the number in training, 612,690 were in training in educational institutions and 317,822 were in training on the job.

Of those in training in educational institutions, 338,158 were in university, college, professional and technological schools; 21,327 were in teacher's colleges and normal schools; 19,590 were in junior colleges; 161,602 were in business colleges, vocational and trade schools and 72,013 were in other schools below college level.

Readjustment Allowances.—Operations under Title V of the Readjustment act of 1944, were begun on a nation-wide basis on Sept. 4, 1944. Subsequently the Readjustment Allowances program, which provided, within certain limitations, financial assistance to both unemployed and self-employed veterans, was extended by Public Law No. 268, 79th congress, to include U.S. citizens who were in active service with Allied governments during World War II

In the period Sept. 4, 1944, to June 30, 1946, a total of

5,533,136 veterans filed applications for determination of entitlement for allowances, of whom 180,798 filed during the fiscal year 1945 and 5,352,338 during the fiscal year 1946. A total of 5,231,391 veterans submitted new claims for unemployment allowances, of whom 159,739 submitted their claims during the fiscal year 1945, and 5,071,652 during the fiscal year 1946.

A total of 368,754 veterans filed new claims for selfemployment allowances, of whom 12,951 filed claims during the fiscal year 1945 and 355,803 during the fiscal year 1946.

Weekly claims for unemployment totalled 46,667,570, including 1,062,481 for the fiscal year 1945 and 45,605,060 for the fiscal year 1946; monthly claims covering self-employment filed totalled 1,449,494, including 38,709 for the fiscal year 1945 and 1,410,785 for the fiscal year 1946. Veterans paid allowances for unemployment received an average of approximately ten weekly payments during the fiscal year ending June 30, 1946.

Disbursements for the fiscal year 1945 totalled \$24,155,313, of which \$20,719,059 represented payments to unemployed veterans and \$3,436,254 payments to self-employed veterans.

During the month of June 1945 a weekly average of 31,832 veterans received unemployment allowances aggregating \$3,572,009, while \$1,059,178 was paid to 10,624 self-employed veterans. During the same period in 1946, a weekly average of 1,780,604 continued claims for unemployment allowances were filed, payments for unemployment allowances aggregated \$176,774,520, while \$27,663,306 was paid to 261,811 self-employed veterans.

Loan Guarantee Activities.—Title III of the Readjustment act of 1944, amended by Public Law 268, 79th congress, made provision within certain limitations for the guarantee of loans or insurance of credit through private lending institutions to veterans of World War II for the purchase or construction of homes, farms and business property.

From Nov. 1944, when loan guarantee activities began, to the close of the fiscal year, June 30, 1945, applications for loans totalled 15,455. Of this number, 12,228 guaran-

teed commitments were issued for a total of \$19,644,824.90, distributed by types as follows: home loans 11,220; farm loans 270; and business loans 738. From July 1, 1945 to June 28, 1946, applications received for guarantee of loans totalled 278,571. Of this number, 223,911 were guaranteed for a total of \$374,332,688.20, distributed by types as follows: home loans 197,787, average guarantee \$1,749; farm loans 7,500, average guarantee \$1,183; and business loans 18,624, average guarantee \$1,045. The over-all average guarantee was \$1,672.

Through June 28, 1946, a total of 1,266 loans had been repaid in full, against which the combined guaranty commitments totalled \$1,743,767.23; defaults, comprising, 26% of loans to that date, totalled 507.

Guardianship.—Reflecting the effects of World War II, the guardianship load of the Veterans' administration rose from a total of 87,346 wards June 30, 1945, to 121,006 wards June 30, 1946.

Of the 87,346 wards in the fiscal year 1945, 73,966 were entitled to benefits because of service by veterans of World War I and other wars, and included 40,771 incompetents (veterans or their dependents) and 33,195 minors; 13,380 wards were entitled to benefits on account of service by veterans of World War II and included 4,326 incompetents and 9,054 minors.

Of the 121,006 wards in the fiscal year 1946, 83,976 wards were entitled to benefits on account of service by veterans of World War I and other wars, and included 39,991 incompetents and 43,985 minors; 37,030 wards were entitled to benefits on account of service by veterans of World War II and included 6,432 incompetents and 30,598 minors.

Thus, from 1945 to 1946 there was a decrease of 780 incompetents but an increase of 10,790 minors, or a total increase of 10,010 wards from World War I service and other wars

Within the same year, from World War II service, there was an increase of 2,106 incompetents and an increase of 21,544 minors, or a total increase of 23,650 wards.

					Table IV	–Guardianship Lo	ad 1937–46	5
Fiscal	yec	ır			Total wards	Incompetents	Minors	Value of estates
1946					121,006	46,423	74,583	\$177,532,742.05

Finance.—The grand totals of net disbursements for the fiscal years 1937–1946 were as in Table V.

	Table V.—Total I	Vet Disbursements	
Fiscal year		Fiscal year	
	\$4,772,072,218.89	1941	\$614,357,411.24
1945	2,271,318,333.42	1940	639,126,696.89
1944	828,391,436.33	1939	600.221.534.14
1943		1938	629,829,721.73
1942	647,333,991.90	1937	893,994,175.08

The 1937 grand total included \$282,656,226.02 for World War I veterans' Adjusted-Service certificates and represented payments made on the certificates and amounts reimbursed to the U.S. government life insurance fund on account of loans made from that fund on certificates under the provisions of the World War Adjusted Compensation act as amended, and the Adjusted Compensation Payment act, 1936.

Veterinary Medicine

The decade 1937–46 saw a rapid growth in the adoption of veterinary medicine as a profession. Several new colleges of veterinary medicine were founded and there was a steady improvement in educational standards to meet the demands of the livestock and food industries.

An important milestone in veterinary research was the establishment of laboratories by the US department of agriculture in the east west middle west and south to implement the work of the agricultural experiment stations on animal pathology and to encourage the use of scientific practices in animal production. Significant advances were made in the prevention and treatment of a number of inimal diseases.

Bovine Tuberculosis and Brucellosis—The US cam paign against bovine tuberculosis started on a nation wide basis in 1917, was officially declared complete in 1940. The incidence of tuberculosis among cattle had been reduced to 05% of the total bovine population at a cost of ap proximately \$60,000 000. The objective was attained by the slaughter and post mortem inspection of all cattle that reacted to the tuberculin (Mantoux) test.

Brucellosis of cattle, known also as Bang's disease, con tagious abortion, and abortion disease, continued to men ace the cattle breeding industry throughout the world de spite genuinely vigorous efforts to suppress it by sanitary methods and vaccination The attenuated culture (vaccine) of Brucella abortus, known as "Strain 19," developed by the Animal Disease Research laboratory of the US bureau of animal industry, was approved for general use in 1940 after five years of critical field trials in widely separated parts of the country Though its preventive value was un questioned, lack of uniform regulations among the states was a deterrent Medical literature testified to the growing prevalence of brucellosis (undulant fever) in human beings exposed to infected animals. A significant discovery in this connection was the high virulence of swine brucellosis (Brucella suis infection) in man. The swine to cow to man passage of the specific organism was definitely confirmed in endemics during the decade

Phenothiazine.—The high vermicide properties of pheno thiazine in farm animals and its low toxicity ranked among the far reaching gains in veterinary chemotherapeutics No worm remedy for livestock removed as many kinds of intestinal parasites from as many species of hosts as did this drug Its worm removing power and concurrent safety was the long sought combination required to keep the health sapping entozoons of domestic animals under con trol The anthelmintic properties of phenothiazine, there fore, ranked among the sensational discoveries of the peri od in animal medicine Worm infected farm animals, pas toral ruminants in particular, suffered from blood sucking nematodes of the genus Strongylus which took a heavy toll in death losses, emaciating gastritis, suppressed growth and loss of weight, especially when pastured on the same ground year after year In terms of food poundage, deaths and net income, the losses were extremely large in swine, cattle, horses, sheep, poultry and dogs, during the period of youth and adolescence

Phenothiazine was found to be somewhat toxic in anae mic horses and mules and young pigs. Otherwise, its safety was remarkable in view of its deadly action on intestinal worms which formerly had responded only to highly poi sonous drugs. An inexpensive anthelmintic for mass treat-

ment of gregarious livestock by simply mixing it in the feed of confined animals or the salt lick of pastoral herds belonged in the records as a useful discovery. In turkeys important results were obtained against the caecal worm *Histomonas meleagridis*, the causative agent of enterohepa titis. Phenothiazine was not found useful in canine and feline medicine.

Equine Encephalomyelitis.—Equine encephalomyelitis, a filtrable virus infection affecting horse man laboratory animals and various genera of wildlife, was a serious threat to horses during the decade 1937-46 Although this neuro trophic disease was found to be due to a filtrable virus in 1930 and in 1932 was already suspected of being trans missible to human beings, the virus was first isolated in the human corpse in 1938 In 1939, two distinctly separate viruses eastern and western, were isolated from the brains of horses Later, a third virus was isolated from horses in Venezuela Each of these viruses was found to be inter changeable between animals and man In the early 1930s, R A Kelser demonstrated 11 species of Aedes in the role of vector between horses. The disease in horses can be controlled by annual vaccination consisting of two injections of a chick embryo vaccine, developed in 1939 by the Rockeseller Institute of Medical Research A condensed description of the disease was published in the 1942 Year Book of the US department of agriculture

Poultry Meat Inspection.—Revolutionary changes took place in the sanitary inspection of poultry at the time of slaughter. Customarily, the bulk of killed fowl enter the channels of trade as "dressed poultry," which in the lan guage of the trade signifies poultry with head, neck and internal organs intact the latter incasing their fermentable contents untouched until 'drawn" at some future time in the meat market or kitchen. The time honoured custom of removing the visceral organs of the fresh carcass and in specting them for clues as to the fitness of the edible parts had not been deemed economically feasible in the marketing of killed poultry until the production line principle of the industrial arts was introduced and quick freezing methods invented.

The invention of equipment which the small poultry-dressing plant could afford to install, rapidly changed the scheme of poultry marketing from insanitary to hygienic In continuous flow, fowl could be bled, plucked, decapitated, eviscerated and inspected, rinsed dried, graded, packed and frozen, and sent into the market in prime sanitary condition at reasonable cost

The reform grew out of the fact that standard meat inspection begins with a critical inspection of the internal organs by a trained technician who, under the regulations of the US bureau of animal industry, veterinary corps of the army, the US public health service, and public health agencies generally, is defined as a graduate of an accredited college of veterinary medicine—a technician familiar with animal diseases and their potentiality in food hygiene Avoiding unnecessary rejections which diminish food poundage is as much an object of meat inspection as re jecting the unfit The evisceration and sanitary inspection of poultry at the time of slaughter made phenomenal gains In the early 1930s there were three poultry eviscerat ing plants in two large cities employing three veterinary inspectors compared with many such plants scattered throughout the US from coast to coast in 1946 and super vised by a force of 135 veterinarians directed by a chief veterinarian from the headquarters of the US department of agriculture

Artificial Insemination.—Whereas the artificial insemination of farm animals had been practised on a large scale for years in the U.S.S.R., interest in the procedure among livestock farmers in the United States began in the 1930s and only among breeders of dairy cattle. Artificial insemination in other animals was resorted to only in isolated instances. In the dairy cattle field, it was promoted by forming breeding societies with centrally-located establishments equipped for the management of the bulls and for skilful collection of semen. Trained veterinarians or other technicians were employed by the society to care for the bulls, collect and transport semen, and perform the insemination on call of its members.

Methods of diluting and preserving viable semen permitted the impregnation of a number of animals from one ejaculation and the shipping of semen for long distances.

The small darry farmer was thus saved the trouble and expense of keeping a bull the year around and of breeding cows to sires of proved prepotency. Venereal infections were prevented, and a larger number of offspring was obtainable from the given sire.

Rabies.—The prevalence of rabies in dogs, farm animals and wildlife steadily increased in the United States during the decade. Because the federal laws pertaining to animal diseases still did not classify dogs as livestock, rabies fell to the sketchy action of the states or communities where outbreaks occurred. Quoting scientists of the U.S. bureau of animal industry: "Outstanding livestock sanitarians visiting this country from abroad expressed amazement at the prevalence of rabies in the United States, a country in which such great strides have been made in the control and eradication of foot and mouth disease, tuberculosis, brucellosis and other contagious diseases of animals."

The campaign against rabies vaccination by certain dogowning groups, and the objection to the passage of a federal law that would enable livestock sanitary officials to cope with dogs as with other animals, were blamed for the tragic situation. Little progress was made in the handling of this disease of man and animals, despite the feasibility of its complete eradication. Canada, Great Britain, South Africa and other countries prohibited the import of U.S. dogs.

DDT.—The chemical, Dichloro-diphenyl-trichloroethane, abridged to DDT, came into use in veterinary medicine in 1943. In three years, its worthiness in livestock production was proved in extensive trials. Aside from the vectors of specific infections, insects reduce the tonnage of meat and milk by molesting animals in the pasture and stable. The horn fly (Haematobia serrata) and the common stable fly (Stomoxys calcitrans) are examples of harmful insects. Swarms of the former actually make pastoral animals run themselves thin. Entomologists charged the horn fly with reducing the production of meat and milk by one-half in vast areas. The common stable fly, unless kept under rigid control, was also pronounced a major menace of the dairy farm. DDT was shown capable of destroying both. The value of this agent in veterinary medicine could be summed up from these two examples, since there were few ectoparasites of farm animals that did not yield to its diligent use.

Newcastle Disease of Poultry.—The grave virus infection of domestic fowl named Newcastle disease for the British community on the Tyne where it was first recognized in 1928, was found to exist in 20 or more states, in a somewhat milder than usual form. Identification of the respiratory-nervous disease, pneumoencephalitis, of California

poultry with Newcastle disease of foreign countries caused widespread alarm among U.S. poultrymen. A conference of poultry pathologists was hurriedly convened at St. Louis, Mo., in 1946, under the sponsorship of the U.S. bureau of animal industry, to plan a definite program for its control. Although the disease was described as a special entity in the Dutch East Indies in 1926, in England in 1928, and thereafter in various parts of the world, it was previously known only as an exotic fowl plague in the United States. As the virulence varied from mild to serious in different outbreaks and its extent remained undetermined, the course of the disease in the United States was unforeseeable at the end of the decade. A review of the animaldisease situation marked the early 1940s as the period in which Newcastle disease was recognized in the western hemisphere.

Sulfonamides.-This group of chemotherapeutic agents was extensively employed after 1937, when sulfanilamide established its superior bacteriostatic action against the ambient flora surrounding domestic animals. This chemical and its numerous companions revolutioned the treatment of a long list of local and general infections of the acute type among which were surgical peritonitis, metroperitonitis, metritis, mastitis, enteritidis, dysentery, coccidiosis, pneumonia, haemorrhagic septicaemia, streptococcal meningitis and the gamut of wound infections. The drugs which achieved popularity through merit were sulfanilamide, sulfamerazine, sulfadiazine, sulfaguanidine, sulfapyridine, sulfasuxidine, and sulfathalidine. Sulfanilamide held its popularity for topical use, sulfaguanidine for intestinal infections, and sulfapyridine for acute bronchopulmonary diseases. Preferences for the others were published, but on the whole, sharp discrimination remained in the field of investigation. Competent critics pointed out that the sulfa drugs were, unfortunately, turning veterinary surgeons away from the refined technique of aseptic surgery.

Antibiotics.—While considerable experimental work was done on the therapeutic value of gramicidin (tyrothricin and tyrocidine), penicillin and streptomycin in veterinary medicine, and important responses were obtained, more extensive clinical use under natural conditions was required to establish the exact places they were destined to occupy in the practice of veterinary medicine. Up to 1947, the cost had been prohibitive. Notwithstanding the fact that bovine mastitis caused by *Streptococcus agalactiae*, for example, responded to intramammary infusions of these antibiotic agents, and significant results in other infections were demonstrated, the price remained too high for general use. With rare exceptions in individual animals of great value, the economics of therapeutic measures continued to rule in animal medicine.

Leptospirosis.-Leptospirosis, or Weil's disease of dogs, caused by the protozoon, Leptospira canicola, and Stuttgart disease or canine typhus were found to be identical with Leptospira infection or Weil's disease of the human being. The two practically identical microbes-L. canicola and L. icterohaemorrhagiae-both originating in rats, as a rule, were found to be interchangeable between man and dogs in natural infections. That is to say, Stuttgart disease, which is a pellagra-like malady of dogs formerly believed to be a nutritional deficiency, leptospirosis of dogs known to be caused by L. canicola, and leptospirosis or Weil's disease of man, which had been definitely attributed to L. icterohaemorrhagiae, were shown to be one and the same disease according to research carried out within the decade 1937-46. In veterinary medicine, the significance of this finding lay in proofs that man might contract lepto-

Listerellosis.—Listerellosis, or "circling disease" of sheep, cattle, chickens and swine, is an intectious meningo-encephalitis described in New Zealand in 1931, in Indiana in 1932, in Illinois in 1937, and in Iowa in 1939. Listerella monocytogenes, previously thought to be pathogenic in laboratory animals only, was isolated in the enzootics reported. Six outbreaks in sheep, seven in cattle, and one in chickens, were reported by animal pathologists of the University of Illinois in 1937–40. Attempts at immunization were negative. The use of sulfonamides gave promising results. The point of interest was that another infectious disease of tarm animals became known in North America.

Infectious Keratitis of Cattle.—A notable advance in animal pathology was the discovery in 1944 of the specific agent of the grave ocular disease of range and other pastoral cattle known as pinkeye, infectious conjunctivitis, or infectious keratitis. The malady was ubiquitous in the United States and Canada, and was reported in South Africa, Germany, France and other countries. In range cattle it caused heavy losses by destroying the eyesight, partially or totally, temporarily or permanently. From their inability to find water and graze food, affected animals emaciated and starved, suffered severe injury on rugged terrain by falling, or died by drowning. The cause was obscure.

Bright sunlight and a mixed secondary infection summed up its actiology, despite years of diligent search among the mixed flora of the affected eyes for a specific microorganism.

In 1944–45, E. M. Baldwin, Jr., of the College of Veterinary Medicine, Ohio State university, working with western cattle, isolated a plump, gram-negative, nonsporulating, nonmotile bacillus of the genus *Hemophilus* which proved to be the specific agent in a series of well-controlled experiments.

The discovery was heralded as a step toward the control of the disease.

Bovine Mastitis.—The prevalence of mastitis in cows supplying market milk remained high in the milk sheds supplying milk for the large cities. In the face of exacting demands for higher grade milk and the complexity of its production and distribution, mastitis continued to be a baffling problem for the dairy farmer and his veterinarian under the existing method of handling milk cows. Because cleanliness in the surgical sense was not regarded as feasible amid the swarming flora of the byre, and the prevention of teat injuries (said to be the chief cause) was not possible under the customary method of housing milking herds, the trend was toward a complete revamping of old methods, milk production having increased faster than production methods had improved. Already, dairy farmers were beginning to herd their cows in an adjacent enclosure between milkings and bring them two at a time to a clean room to be milked. Under the prevailing setup (stable, stanchion, hard floor, excrement gutter, cow, milker, udder, milk, and utensils), the assemblage became a gigantic reservoir for germs and an excellent incubator which tended to nullify local antiseptic infusions. Among the drugs employed for intramammary infusion were iodine, acridine dyes, silver oxide, sulfonamides and antibiotics (gramicidin and penicillin). Whereas these germicides had certain therapeutic values, the consensus was that reforming the customary herd management would be necessary to control

Trichinosis.—Although trichinosis of swine was presumed to antedate the Mosaic injunction against the eating of

pork, thorough cooking as a preventive measure was of later origin. Trichinella spiralis, the specific metazoon, was discovered in human cadavers in 1835 by James Paget in England, and Joseph Leidy in the U.S. found the adult worm in carcasses of swine in 1846, not to ignore scientists whose investigations led to these climactic findings. In 1916 B. H. Ransom of the U.S. bureau of animal industry demonstrated that refrigeration of pork at 5° F. for 20 min. destroyed the viability of trichinae and that shorter exposures at lower temperatures were likewise protective. A third preventive measure recommended by hygienists of the food industries was the quick freezing of all pork at low temperatures before releasing it to the markets. Protagonists of the frozen-food idea contended that quick freezing of pork and a short period of storage in the frozen state would solve the trichinosis problem of human medicine. T. spnalis is commensal in animals so far as could be detected in the living subject but, as generally known, continued to be deadly to man. According to extensive investigations of the U.S. public health service and other agencies, the incidence was higher in man than in any animal thus far critically studied.

Veterinary Service in World War II.—In order to provide the U.S. army with the stated quota of veterinary officers without depriving important livestock areas of an adequate force of veterinarians, the veterinary service of the United States in 1941 was organized and operated under national authority—the Procurement and Assignment Service for Physicians, Dentists and Veterinarians—to the end that the military forces were able to acquire the largest force of veterinarians ever mobilized for wartime duty, and animal diseases were kept under rigid control.

Whereas each infantry division of World War I had 6,719 horses and mules, the transportation of the same unit of World War II was practically all mechanical. It might be deemed strange, therefore, that a larger force of veterinarians was needed in World War II. The paradox was explained by the fact that horses, mules, donkeys, camels, pigeons, caribou, war dogs and laboratory animals, each one a precious element of the command at times and places where replacements could not be obtained at any price—called for the best medical attention possible. Among these animals there were glanders, anthrax, tetanus, African horse sickness, surra, encephalomyelitis, variola, canine distemper, and many other maladies to prevent by vaccination or other means.

The regulation that "soldiers shall not touch any food not inspected by the Veterinary Corps," explained why a highly-trained veterinary service was needed in modern warfare. Training schools were maintained at large meatpacking and food-processing centres to accomplish that end. The military rations were inspected from the source of the food to its delivery to troops at distant outposts and hospital ships, to cars, trucks and storage under unfavourable climatic conditions.

The veterinary corps was also called upon for sanitary policing of native animals surrounding faraway military stations, and for the study and possible control of exotic infections and parasitisms.

508 Vichy

One of the best known French spas, the alkaline waters of which helped generations of gourmets suffering from stomach catarrh or liver complaints, Vichy became famous as the temporary capital of the unoccupied zone of France after the capitulation of June 22, 1940. This chief town of the Allier département, with a population of 25,-074, had in 1937 more than 138,000 baigneurs, including 13,000 foreigners. In the summer of 1940, however, quite a different kind of temporary visitor filled its palatial hotels and modest pensions: French politicians, generals, admirals, civil servants, journalists, and also foreign diplomats. Hôtel du Parc became the headquarters of Marshal Philippe Pétain, chief of the ephemeral "Etat Français," and of Pierre Laval, his vice-premier and minister of foreign affairs until Dec. 15, 4940, and again from April 18, 1942, when under German pressure Pétain had to restore to power the man whom he had previously dismissed "in the interest of the nation."

Admiral Jean Darlan, the other vice-premier and heir apparent to marshal's mantle as chief of state, resided as navy minister at the Hôtel du Helder. Ironically enough, the Hôtel Britannique was the seat of the ministry of colonies and the Hotel de Russie accommodated the ministry of the interior. All the foreign embassies and legations were crowded in the Hôtel des Ambassadeurs. Many Paris daily newspapers, such as the Conservative Figaro and Journal des Débats, the big business Temps, the royalist Action Française, the Catholic Croix and the socialist but pro-Pétain Effort transferred their editorial offices from the occupied capital to Vichy. Many right-wing weeklies and monthlies did the same. At the end of 1940 the wartime population of Vichy exceeded 62,000. After the occupation by the Germans of the "free zone" (Nov. 11, 1942) the population slightly declined and in the summer of 1944 was estimated at 56,000.

The Allied landings in southern France (Aug. 15, 1944) forced Pétain and his administration to leave for Belfort and later for Sigmaringen. Liberated by the French forces of the interior, Vichy recovered its municipal freedom. The city council, appointed by the Pétainist *préfet* in 1940, was dissolved, and a new council was elected on April 29, 1945; very similar to the pre-1939 political composition, it

Marshal Pétain's guard, detailed to the office of the secretary of war at Vichy in 1942

consisted of moderate republicans, Catholics and radicals. The first postwar year which could be described as normal was 1946: in this year the permanent population of Vichy was 29,391. The season was good, but far from the prewar mark; there were only 71,409 baigneurs, including 6,214 foreigners. No apparent changes were found by the visitors, as neither in 1940 nor in 1944 was there any fighting in Vichy, and the city was never bombed.

Victoria

A state of the Australian commonwealth, Victoria has an area of 87,884 sq.mi.; pop.: (1937 est.) 1,859,487;

Frenchmen waiting for their daily tobacco rations at Vichy in 1941

(1946 census) 2,029,800. Chief cities (pop. 1945 est.). Melbourne (cap., 1,184,000); Geelong (41,300); Ballarat (30,-500); Bendigo (30,900). Governors: Lord William Huntıngfield (Dec. 1933-Nov. 1938); Maj. Gen. Sır Winston Dugan (after Nov. 9, 1938). Prime ministers: Albert A. Dunstan (1935-43); John Cain (four days only); Albert A. Dunstan (1943-Oct. 1945); Ian Macfarlan (four weeks only); John Cain (after Nov. 21, 1945).

During the life of the first Dunstan government, a new formula was introduced for settling disputes between the legislative council and the legislative assembly (upper house); it replaced plural voting for the legislative council with adult suffrage. Reform was also instituted in the Melbourne city council by the abolition of aldermen. Cooperative home building, under which the government guaranteed up to 90% of the cost of homes, was passed by the Victorian parliament in Dunstan's second ministry.

Main features of the Cain government's legislation included a comprehensive Soldier Settlement bill, liberalized benefits under workers' compensation, abolition of late Friday night trading, and independent tribunals for the public service, teachers and police. Two outstanding legislative moves in 1946 were the introduction of a bill to empower the government to take over the Victorian gas industry (electricity was already controlled by the government through the state electricity commission), and the establishment of a branch of the Melbourne university at Mildura, an important fruit-producing centre about 360 mi. from Melbourne.

A postwar program, estimated to cost £A50,000,000, was implemented by the Cain government. The greater portion of this amount was marked for water conservation, chief project being the construction at Eildon of a new dam to cost £A8,400,000. This was the biggest single engineering project ever contemplated in Australia. Other water conservation projects included in the program were enlargement of the Hume weir and construction of Cairn Curran, Eppalock, and Nambrok-Denison reservoirs. Other postwar works listed were the development of brown coal fields (to make Victoria less dependent on coal from the state of New South Wales), extension of electricity mains, forestry works, main roads, land settlement and the building of new schools and hospitals.

In 1939 and 1944 particularly, Victoria suffered devastatingly from bush and grass fires which in the latter year cost 51 lives and caused £A2,581,527 worth of loss in houses, outbuildings, livestock, fencing, grass, etc. In 1946 an elaborate fire-fighting scheme was established, which included two-way radio spotting aeroplanes, spotters in towers, 51,000 voluntary fire fighters, thousands of feet of hose and scores of motor vehicles. Experiments were

> "bombs" laden with fire extinguisher, which burst on impact. (A. R. Mn.)

Vinson, Frederick Moore

Vinson (1890-), U.S. jurist, was born Jan. 22, 1890, at Louisa, Ky. A graduate of Kentucky Norm'al college, 1908, he later attended Centre college, receiving his B.A., 1909, and his law degree, 1911. He was commonwealth attorney of the 32nd judicial district of Kentucky, 1921-24, and served seven terms in the federal house of representatives.

Vinson assisted in formulating revenue legislation as a member of the house ways and means committee. Strongly prolabour at that time, he voted for the National Labor Relations board, and helped push the undistributed profits

tax bill through congress. In 1937 he was named by President F. D. Roosevelt to the post of associate justice in the U.S. court of appeals (Washington, D.C.), assuming his new duties in May 1938. He returned to active government service in May 1943 as director of the Office of Economic Stabilization.

President Roosevelt appointed Vinson federal loan administrator in charge of the Reconstruction Finance corporation (March 5, 1945) and director of the Office of War Mobilization and Reconversion (April 2). President Truman appointed him secretary of the treasury after Henry Morgenthau's resignation; he was sworn into this office on July 23.

On March 11, 1946, Vinson was elected chairman of the board of governors of both the International Bank for Reconstruction and Development and the International Monetary fund, whose delegates were then meeting in Savannah, Ga. He was named chief justice of the U.S. supreme court by President Truman on June 6, and was sworn into office on June 24, 1946.

Virginia

Southernmost of the middle Atlantic states, Virginia was one of the 13 original United States; popularly known as the "Old Dominion" and as the "Mother of Presidents." Area, 40.815 sq.mi., including 916 sq.mi. of water. Population (1940) 2,677,773, of which 35.3% were urban and 64.7% rural; an estimate placed the white population at 2,013,723 and nonwhite at 664,050. On July 1, 1944, the bureau of census estimated the population of the state at 3,199,115. Capital, Richmond (193,042). Other cities include Norfolk (144,332), Roanoke (69,287) and Portsmouth (50,745).

At the beginning of the decade 1937–46, the leading state officials were: governor, George C. Peery; lieutenant governor, James H. Price; attorney general, A. P. Staples. In the Democratic primary election of Aug. 1937, Lt. Gov. James H. Price was nominated over Vivian Page for governor; Saxon W. Holt over Robert W. Daniel for lieutenant governor, and attorney general A. P. Staples, renominated. These nominees were elected in the usual Democratic victory which won 94 of 100 seats in the house of delegates.

On Jan. 19, 1938, Price was inaugurated governor. Legislation in 1938 included: public assistance, housing and unemployment, all acts toward carrying out programs fixed by the national government; a comprehensive county zoning act; authorization for erecting a new state library building; perfection of control granted state hospital board; regulation of outdoor advertising on public highways; and revisions in the system of dispensing justice. Judicial salaries were increased, and a voluntary retirement plan was introduced for certain judicial officers; procedure before the supreme court of appeals was amended to expedite its work; and the Bar Integration act allowed that court to organize and govern the state bar association as an administrative agency to investigate and report violations of rules and regulations adopted by that court for controlling the professional conduct of lawyers. An innovation in state law was the enabling legislation relating to the creation of the Hampton Roads sanitation district, com-

prising several counties, cities and towns, to eliminate pollution in adjacent waters.

Following the trend of studying subjects thoroughly before taking legislative action, the general assembly assigned topics to advisory legislative council or to special commissions as follows: apportionment of house and senatorial districts; coal industry; codification of general insurance and school laws; game and inland fisheries; jail system; labour relations; and a state civil service plan. While the federal government retained title to the property, the federal Farm Security administration allocated to Virginia 45,000 ac. in Appomattox, Buckingham, Cumberland and Prince Edward counties for state park purposes. Appomattox surrender ground, 1,000 ac., was to be turned over to the national park service.

Principal state officials serving with Gov. Price in 1939 were: Saxon W. Holt, lieutenant governor; Raymond L. Jackson, secretary of state; and A. P. Staples, attorney general.

The 1940 general assembly passed a constructive group of measures increasing appropriations for public education and welfare, bringing the unemployment compensation act in conformity with federal legislation, establishing premarital examinations, providing a comprehensive mining code and taking steps toward eliminating pollution in rivers. Bills introduced at this assembly to integrate Virginia's penal system, to place county sheriffs and city sergeants on salaries, to encourage mediation and conciliation of labour disputes, to establish a state personnel system and to create an actuarially sound retirement plan for teachers were not passed. In the 1940 national election, Virginia gave F. D. Roosevelt 235,961 votes, Wendell L. Willkie 109,363. Harry F. Byrd was returned to the senate; all nine Democratic candidates were elected to the house of representatives.

The general assembly did not meet in 1941. As usual, Democratic nominees for Virginia's three elective offices won in the general election of 1941, with Colgate W. Darden, Jr., as candidate for governor; William M. Tuck for lieutenant governor and A. P. Staples for attorney general for the third successive term. Democrats won 17 contests out of 25 in the house of delegates and 3 out of the 4 special elections for vacancies in the state senate.

The biennial session of the general assembly began Jan. 14 and ended March 14, 1942. The war program outlined by Gov. Darden in his inaugural address was substantially and quickly made law. The assembly established a state department of corrections; established a retirement system for state employees and school teachers; established a personnel and merit rating system for state employees; made the governor director of civilian defense; added \$5,000,000 to the sinking fund and simplified the administration of several state departments. A special session of the assembly met from Sept. 29 to Oct. 1. Approving unanimously the governor's suggestion, the legislature provided for eventual liquidation of the state debt by transferring an additional \$10,000,000 of an unobligated surplus of \$18,639,879 from the treasury to the sinking fund for the purchase of federal government bonds.

The state's shipyard industry soared in 1943, and the population of Newport News increased from 35,000 to more than 55,000. Shipyard workers numbered close to 30,000, of whom 1,600 were women. War brought a marked redistribution of the state's population, as the rapid expansion of industrial localities sucked labour from farm areas. There was no session in 1943 of the general assembly. although interim commissions were active in such fields as small-loan legislation, co-operatives, medical

licensing requirements and public health. The state department of corrections, which was established in 1942, ended its first year of operation with 501 prisoners on parole and 600 on probation. A general election in Nov. 1943 resulted in 15 new members in the state senate and 35 new members in the house of delegates.

(J. S. Br.; X.)

The general assembly convened for its regular biennial session early in 1944. Legislation was enacted providing a substantial increase in salary for public school teachers, and earmarking nearly \$20,000,ooo in the general fund for postwar expenditure on needed construction at state institutions. A program of forest protection and conservation was adopted, and industrial compensation benefits were extended to cover a score of occupational diseases. The assembly ordered interim studies of the school system, the sales tax, water pollution and general taxation. Two laws were enacted to permit Virginia servicemen to vote in 1945 elections without payment of poll taxes or compliance with registration requirements. On Nov. 20 the Virginia supreme court of appeals held these "soldier vote" laws unconstitutional. and on Dec. 14 the assembly was summoned into special session; a law was passed calling for an election to determine whether a constitutional convention should

be called to amend the constitution so as to provide means for servicemen to vote. A general election in Nov. 1944 gave 242,276 votes for President Franklin D. Roosevelt, 145,243 for Gov. Thomas E. Dewey, 966 for minor party candidates. Dr. Dabney S. Lancaster was state superintendent of public instruction in 1944.

The general assembly convened in extraordinary session in March 1945, following a referendum on March 6 in which the people voted 54,515 to 30,341 in favour of a constitutional convention to provide a means for Virginia servicemen to vote in state and local elections. In addition to arranging for the election of delegates to this convention, the legislature at this session provided a substantial increase in the state contribution to salaries of public school teachers, appropriated more than \$1,200,000 for visual education equipment and paved the way for study

Virginia: Statistical Data

of election laws by an interim commission. The constitutional convention in April added a new section to the constitution to validate a plan for war voting. A general election in Nov. 1945 saw William Munford Tuck elected governor by a two-to-one margin over S. Floyd Landreth, Republican, and Howard Carwile, Independent.

The general assembly convened in regular session in Jan. 1946 and wrote 400 new laws before its adjournment in March. A State Water Control board was created to reduce pollution in public waters, and a State Board of Elections to maintain general supervision over all public elections. The assembly also approved an increase in the state gasoline tax, with funds earmarked for improvement of secondary roads. The first step was taken toward abolition of the state poll tax by constitutional amendment. As 1946 ended, Gov. Tuck called the assembly back in extraordi-

nary session to grant teachers an additional increase in pay (one had been voted at the regular session) and to consider bills guaranteeing a right to work despite "closed shop" labour union agreements and prohibiting strikes in public utilities.

Virgin Islands

A United States possession in the West Indies, east of Puerto Rico, the Virgin Islands comprise the island of St. Croix (pop. 12,902); the island of St. Thomas (11,265) and the island of St. John (722). Area, 133 sq.mi.; population in 1940, 24,889, 13.1% more than in 1930, with whites 9%, Negroes 69% (1930, 78.3%), mixed and other races, 22% (1930, 12½%). The main cities are Charlotte Amalie, the capital on St. Thomas, pop. 9,801 (1930, 7,036); Christiansted 4,495 (1930, 3,767) and Frederiksted, 2,498 (1930, 2,698) on the island of St. Croix.

On May 17, 1946, William H. Hastie was inaugurated as the fourth civilian governor of the Virgin Islands, succeeding Charles Harwood, who took office on Feb. 2, 1941. Lawrence W. Cramer was governor from 1935 to 1941.

During the decade 1937-46, there were many important changes in political organization, all of which were smoothly effected. On Jan. 1, 1937, by reason of the operation of the Organic act of the Virgin Islands enacted on June 22, 1936, the new municipal councils took office. These councils, consisting of nine members of the municipal council of St. Croix and seven members of the municipal council of St. Thomas and St. John, all elected by the qualified electors of the island, replaced the old colonial councils which were partly appointed and partly elected by a limited electorate whose qualification for voting was a property one. Universal suffrage was established in 1938, and the hitherto disfranchised majority of the population immediately showed and maintained considerable interest in government and political organization. The promise of President Truman in his first 1946 message to congress that "The people of the Virgin Islands should be given an increasing measure of self-government" was received with enthusiasm. At the end of ten years, the people of the

islands were preparing their own proposals for revision of the Organic act of 1936, consistent with the president's policy.

The most significant recommendations, made by a committee appointed for that purpose, included a single legislature for the islands to meet annually in 60-day sessions, the removal of the power of the governor to send bills passed over his veto to the president for final decision, the creation of a single treasury and the establishment of the office of resident commissioner in Washington.

These suggested revisions were to be included in a comprehensive plan for modernization of the Organic act to be placed before the congress during 1947.

In 1946 there was an accelerated withdrawal of personnel from all military establishments in the Virgin Islands, until at the year's end army and navy installations, which accommodated 1,000 or more men during World War II, were reduced to essential maintenance personnel. Of approximately 800 Virgin Islanders who were conscripted for military service and sent abroad, 650 had been demobilized and returned to the islands. These figures did not include Virgin Islanders who were conscripted in the United States or those who voluntarily enlisted.

The U.S. Selective Service act was not made applicable to the Virgin Islands until Oct. 26, 1943 by a proclamation signed by Pres. Franklin D. Roosevelt on that date. Registration began on Nov. 16, 1943. The first call for men from the Virgin Islands was in 1944.

The legislative authorities of the Virgin Islands, consisting of two municipal councils and a legislative assembly, comprising the two councils in joint session, sponsored social legislation, especially in the municipality of St. Thomas and St. John, of a most important character. Outstanding pieces of legislation during the decade 1937–46 were a Workmen's Compensation act in 1941 in St. Thomas and a similar act in St. Croix in 1946; a minimum wage and maximum hour law in St. Thomas in 1942. There was no such law, however, in the municipality of St. Croix. A municipal insurance fund, for workmen's compensation, was established in St. Thomas and was successful. (E. G. A.)

Vishinsky, Andrei Yanuarevitch

Vishinsky (1883–), Russian statesman, was born in Kiev. He studied law at the University of Kiev and joined the Menshevik faction of the Social Democratic revolutionary movement in 1902. He participated in the abortive revolt of 1905 in the Baku area and served a year in prison. After his release, he practised as a criminal lawyer in Moscow.

When the Bolsheviks took power, Vishinsky quit the Mensheviks and served in the Red army for a year, joining the Communist party in 1920. In 1923 he was appointed attorney-general for the Russian Soviet Federated Socialist republic and he was professor of jurisprudence in Moscow university, 1925–27. He was named the All-Union deputy public prosecutor in 1933 and was public prosecutor from 1935 to 1939. He rose to fame for his prosecutions in the famed treason and purge trials, 1936–38.

In 1940 he became vice-chairman of the council of people's commissars and deputy commissar for foreign affairs in 1940. During World War II, he attended most of the important inter-Allied conferences; in 1946 he was a second to Molotov at the United Nations sessions in London, New York and Lake Success, N.Y. at the meetings of the Council of Foreign Ministers and at the 21-nations peace conference in Paris.

Throughout the meetings of the Council of Foreign Ministers and the 21-nations peace conference in Paris, Vishinsky aggressively opposed the western Allies in debate on many important questions, but at the U.N. meetings in Lake Success, he showed a more conciliatory mood, leading diplomatic observers to believe that the soviet delegation had received orders to become "more reasonable."

Vital Statistics

See Birth Statistics; Census Data, U.S.; Death Statistics; Infant Mortality; Marriage and Divorce; Suicide Statistics.

Vitamins

A rapid expansion in knowledge of vitamins occurred during the decade 1937–46, both in fundamental scientific studies of the biochemistry and physiology of these nutrients and in the application of this information to improved health. Especially outstanding in this progress was the determination of the chemical structure and the synthesis in the laboratory of practically all of the known vitamins; development of microbiologic methods for estimating many of the vitamins; development of the concept of antivitamins or vitamin inhibitors and their role as antibiotics; an understanding of the normal human needs for vitamins and the use of many of the vitamins in the nutritive improvement of some staple foods (enrichment of flour, etc.) and in the treatment of specific diseases—for example, vitamin K in certain haemorrhagic disorders, nicotinic acid or amide for pellagra and folic acid for macrocytic anaemias.

Fat Soluble Vitamins.—Vitamin A.—The synthesis of vitamin A was reported twice but no practicable method was available at the end of the decade. In addition to vitamin A, long known to occur in sea fish oils and to be structurally similar to the yellow pigment, carotene, another form named vitamin A2 was found in the oils of some fresh water fish. Vitamin A2 was crystallized in 1946; its physical properties differ from vitamin A, and it is about a 100 times less active in promoting the growth of rats than is vitamin A. The National Research council's recommended daily allowance of this vitamin was 5,000 international units for adults, probably allowing ample margin for safety. Vitamin A is used extensively in fortifying margarines. Although relatively little is known of the physiological function of vitamin A, George Wald demonstrated that the photosensitive pigment in the retina of the eye, the destruction of which originates the nerve impulse, is a protein-vitamin A complex. Some doubt was expressed as to the correctness of Wald's scheme in all of its details. It was demonstrated that vitamin A is directly concerned with bone growth. Paralysis in the deficiency is due to pressure on nerves which continue growth after bone growth has stopped.

Vitamin D.-This term is applied to substances of the sterol group which have anti-rickets properties. In 1946 at least ten such substances were known; about half were well defined as chemical entities, but only two were of outstanding nutritional importance. The two important vitamins D are activated ergosterol (vitamin D2, calcified viosterol) and activated 7-dehydrocholesterol (vitamin D₃). Much work was done on the mode of action of vitamin D, but all that could be said is that it somehow influences the adsorption and metabolism of calcium and phosphorus. E. A. Park and associates, on the basis of histologic studies on routine postmortem examinations, reported an unusually high incidence of rickets (slightly more than 50%) in consecutive examinations of 230 children between the ages of 2 and 14 years. Little was known of the vitamin D requirement of man; however, the recommended allowance for children was 400 to 800 international units per day. Adults require perhaps half that amount or less.

Vitamin K.—This vitamin, known as the antihaemorrhagic vitamin, exists in several chemically related forms. Vitamin K₁ was originally isolated from alfalfa leaf meal and vitamin K₂ from sardine meal. Many synthetic compounds have activity. The most potent, 2 methyl, 1-4, naphthoquinone, is more active than the natural compounds, and was widely used clinically during the decade. It was shown that the low clotting ability of the blood in vitamin K deficiency was due to a low content of prothrombin. Hypoprothrombinemia in various clinical conditions, such as haemorrhagic disease of the newborn, and postoperative haemorrhage associated with liver disease, was found to respond dramatically to vitamin K. The human requirement for this vitamin was unknown but in most cases it is probably synthesized by the intestinal flora.

Vitamin E.-This vitamin, also known as tocopherol (alpha, beta, or gamma), is widely distributed in nature. In certain mammals vitamin E deficiency causes a degeneration of striated musculature, as well as sterility. Deficient chicks show a brain degeneration, encephalomalacia, or an impairment of the capillary walls which produces an edema. Since muscular dystrophy (imperfect nutrition) is one of the major signs of vitamin E deficiency in experimental animals, considerable interest was shown in possible relationships between this vitamin and muscular dystrophies in man. While numerous claims were made for the therapeutic value of vitamin E in various types of muscle dystrophies, in sterility and in heart disease, none was as yet accepted. The human requirement for vitamin E was unknown and, in fact, no proved deficiency of vitamin E in man had been reported.

Water Soluble Vitamins.—Ascorbic Acid (Vitamin C).— The absence of vitamin C eventually leads to scurvy. A search for natural sources of this vitamin and for improvement of the commercial synthesis assumed considerable importance during World War I, for in every previous war there had been large outbreaks of scurvy in armies and among civilians. It was found to exist in large quantities in a great variety of non-citrus materials, such as green walnuts, pine needles, rosehips and various berries. Citrus fruits, tomatoes, cabbage and potatoes had long been recognized as important sources. Numerous advances were made

in the chemical determination of this vitamin. Additional evidence on the importance of ascorbic acid to the health of the gums was found, and while it was discovered that there are many infective types of gingivitis not related to lack of this vitamin, there was no doubt that this vitamin is important in healthy gingival tissue. The chemical function of this vitamin still remained an enigma at the end of the decade. The recommended daily allowance for man was in the range of 75 mg. per day. Ascorbic acid is easily destroyed (oxidized) and is frequently lost in the preparation of food.

B-Complex Vitamins.—Thiamin (Vitamin B_1).—The absence of this vitamin from the diet leads to beriberi, one of the classical deficiency diseases. At the beginning of the decade, events of considerable importance took place concerning this vitamin. In 1936 R. R. Williams had announced its structural formula and synthesis, and a year later K. Lohmann isolated a crystalline coenzyme from yeast which was necessary in pyruvic acid metabolism and showed that it was composed of thiamin and phosphoric acid. Numerous investigators later found that this thiamin containing coenzyme, known as co-carboxylase, is necessary tor the oxidation of carbohydrate, and plays a specific role in all biological reactions involving pyruvic acid. The exact amount required is directly related to the amount of carbohydrate and protein metabolized, but fat metabolism does not require thiamin. Numerous studies were made concerning man's requirement for this vitamin, and it was found to be in the range of one to two mg. per day. Early symptoms of thiamin deficiency in man include fatigue, muscle soreness, irritability, insomnia, paresthesias and loss of appetite. Thiamin is one of the principal B-vitamins removed in the refining of white flour, and hence it was considered in policies concerned with the nutritive improvement of flour through enrichment.

Riboflavin.-This vitamin of the B-complex is also important in oxidative reactions as it is the functioning part (prosthetic group) of a series of enzymes known as the yellow enzymes. In 1938 it was found to be of importance in man when W. H. Sebrell and R. E. Butler described riboflavin deficiency in man as being characterized by an inflamed tongue (glossitis), a fissuring at the angles of the mouth and denudation of the lips (cheilosis) and a characteristic dermatitis (seborrheic). Two years later, it was reported that in this deficiency there was an increase in the capillary blood vessels of the cornea of the eye. Few data were presented on which to base the riboflavin requirement of man, but it was generally stated to be about 2 mg. per day. Riboflavin was also used in the enrichment of white flour. Certain bacteria produce large amounts of riboflavin and this became one of the principal commercial sources.

Niacin (Nicotinic Acid or Nicotinic Amide).—A deficiency of this vitamin leads to the deficiency disease, pellagra. Niacin is also concerned with oxidative reactions in that it is the prosthetic group of two coenzymes known as the pyridine nucleotide coenzymes. In 1937 C. A. Elvehjem and co-workers made the important discovery that niacin prevented and cured the condition known in dogs as "black tongue," and which was known to be similar to pellagra in man. A few weeks after this discovery, numerous investigators reported its effectiveness in human pellagra.

However, the enigma of pellagra was not completely solved by this discovery. An interesting problem was why people consuming large amounts of corn developed pellagra. It was found again by Elvehjem and his students that there is an interrelationship between tryptophane and

niacin. Apparently some niacin can be made from the amino acid, tryptophane, which is low in corn. It was also demonstrated that corn contains some material which actually increases the niacin requirement. Niacin was used in the enrichment of white flour and corn meal. The recommended daily allowance of this vitamin for man was found to be in the range of 10 to 15 mg. per day.

Pyridoxine (Vitamin B₆).—This member of the B-complex was isolated and identified chemically in 1938 and shortly thereafter was synthesized. It was first associated with growth and a characteristic dermatitis in the rat, but was later shown to be essential for the chick, dog, pig and duck. Anaemia is a symptom in all of these species. A deficiency syndrome of this factor in man was reported but not confirmed. It was found that pyridoxine existed in at least two other chemically related forms known as pyridoxal and pyridoxamine, both of which have biological activity comparable to pyridoxine.

Pyridoxine-deficient rats, dogs and pigs were found to exhibit in vivo a defect in the metabolism of the amino acid, tryptophane. Still another relationship of pyridoxine to amino acid metabolism was demonstrated by the discovery that the decarboxylation of tyrosine by certain bacteria is dependent on the presence of a phosphorylated pyridoxine substance. Thus, pyridoxine may function as a coenzyme in the decarboxylation of amino acids.

Rats, dogs and pigs made deficient in pyridoxine, a portion of the vitamin B complex, were found to have also a defect in the manner in which the body used tryptophane, one of the essential amino acids. It was also found that the breaking down by certain bacteria of tyrosine, another amino acid, through removal of carbon and oxygen, is dependent on a substance consisting of pyridoxine and phosphorus. A role of pyridoxine and its derivatives in enzymic reactions involving a transfer of amino groups (transamination) was also discovered.

No specific information on the pyridoxine requirement of man was available at the end of the decade.

Pantothenic Acid.—This vitamin was first associated with chick nutrition as a factor necessary to prevent a specific dermatitis. It was isolated and synthesized in 1940. In the rat, a deficiency of pantothenic acid was found to produce a greying of the hair though there is no evidence that a similar relationship exists in man. In the rat, a relationship between histologic changes in the adrenal glands and pantothenic acid deficiency was found. No data were available at the end of the decade on the requirement of man for this vitamin, and no proved case of pantothenic acid deficiency in man had been reported.

Biotin.-The feeding of large amounts of raw egg white to animals produces eczematous dermatitis which can be prevented by feeding yeast, liver and certain other foods. It was shown that the factor was the same as the growth factor for yeast, biotin, previously isolated from egg yolk by F. Kögl. Its structure and synthesis were worked out in 1942 largely by the work of V. du Vigneaud. In most animals biotin is synthesized in the intestinal tract. Egg white contains a protein, avidin, which combines with biotin and prevents its utilization, thus producing the deficiency. Certain species-the chick, duck, monkey-require biotin in the diet since an insufficient amount is synthesized in the gut. Biotin deficiency in man was reported by feeding exceedingly large amounts of raw egg white, but no information on the biotin requirements of man was available in 1946.

Choline.—This substance became of increasing interest in nutrition during the decade through the discovery that it furnishes methyl groups needed for certain necessary biological reactions and is also required for the metabolism of fat in the animal body. It was found that in the absence of choline in the diet, fat accumulates in the liver and seriously interferes with the function of this vital organ. It was also shown that other organs may also be affected under certain conditions, particularly the kidneys. Choline was also found to be of varying therapeutic value in the treatment of cirrhosis of the liver in man. Proved choline deficiency in man had not been reported at the end of the decade, and no information was available on the requirements of man.

Folic Acid.-The term "folic acid" was first used in 1941 to designate a factor necessary for the growth of certain bacteria. Subsequent studies by many investigators showed that similar preparations contained biologic activity for the chick, rat, monkey and other micro-organisms. A concentrate previously known as vitamin M, necessary for the prevention of leukopenia in monkeys, was found to have many properties similar to folic acid concentrate. A concentrate of liver known as vitamin Bc, necessary for the prevention of a macrocytic anaemia in chicks, also had properties similar to folic acid. In 1945 the chemical synthesis of L. cases factor, the name given to the folic acid like compound necessary for the growth of Lactobacıllus casei, was announced, though the details of structure and synthesis were withheld until the following year. At that time, it was shown that this substance consists of one molecule each of pterin, para-aminobenzoic acid and glutamic acid. It was found in 1945 that this synthetic L. casei factor had pronounced haematopoietic activity in macrocytic anaemias such as occur in pernicious anaemia, sprue, pregnancy and in certain nutritional deficiencies. No data were available in 1946 on which to base any figure as to the daily requirement of man. In the treatment of macrocytic anaemias in man, as little as 2 mg. per day was effective, though generally 20 to 50 mg. daily were used.

Antivitamins or Vitamin Inhibitors.—The concept of antivitamins, antimetabolites, or vitamin inhibitors was developed during the decade. These are substances whose chemical structures are similar to a specific vitamin or metabolite and which are effective in blocking the biologic activity of the vitamin. They thus interfere with the vitamin's function. One of the vitamins which received early attention in this regard was pantothenic acid, for which several antivitamins were synthesized. Other antivitamins were found for riboflavin, thiamin, niacin, ascorbic acid and biotin. These substances became of particular practical interest in the field of chemotherapeutics, for some of them were found to penetrate the bacterial cell and block enzyme reactions vital to the life of the cell.

The chemotherapeutic effect of the sulfonamides was explained in this way, in that they interfere with the action of para-amino-benzoic acid, an essential metabolite for many bacteria.

Microbiologic Assays.—Of interest and value during the decade 1937–46 was the development of a new analytical tool for determining amounts of some of the vitamins and other essential nutrients, such as certain amino acids—namely, the microbiologic assay technique. In this procedure a micro-organism is grown in a medium deficient in the one nutrient to be assayed; then if an unknown amount of this nutrient is added to the medium, the growth of the organism will be, under appropriate conditions, proportionate to the amount of this nutrient added. Rather than measure the growth of the organism, one may measure a metabolic by-product such as the production of lactic acid by an organism such as Lactobacillus casei. The advantages of microbiologic techniques for the assay of

vitamins are obvious. Any procedure which makes possible increased speed and accuracy of vitamin estimations is of value. This procedure was developed particularly with regard to pantothenic acid, riboflavin, niacin and pyridoxine.

Synthesis of Vitamins by Intestinal Flora.-About the beginning of the decade, the concept was developing that the bacterial flora which normally inhabit the intestinal tract synthesize a number of nutrients which are available to the host. This concept was greatly expanded, and a considerable amount of data was obtained to support it. It was shown that all the vitamins of the B-complex are, in certain animals and in varying amounts, synthesized by the intestinal flora. It was also shown that in man at least thiamin and riboflavin may be so synthesized. The synthesis of vitamins by intestinal micro-organisms may be influenced in many ways, particularly by diseases and drugs which alter the intestinal flora. The relatively insoluble sulfonamides were found to inhibit markedly intestinal synthesis of vitamins and were used as an experimental tool to produce certain vitamin deficiency diseases in animals. Differences in intestinal synthesis might explain many previously puzzling results, i.e. the development of deficiency signs by some individuals on diets which are apparently adequate for others.

Vitamins in Foods.—With the discovery of many new vitamins of the B-complex, a vast amount of research was done on the occurrence of these nutrients in food and on losses incurred in processing and storing food. Much of this research was carried out by the quartermaster corps of the army and the department of agriculture. The Bureau of Human Nutrition and Home Economics of the department of agriculture issued a bulletin (U.S. Department of Agriculture, Miscellaneous Publication no. 572) giving information on food composition. Losses in vitamin content during processing of foods were shown to be extremely variable depending on the nature of the processing. Nutrients were shown to be more stable if contact with heat and air are kept at a minimum. Ascorbic acid, vitamin A and thiamin are the nutrients most likely to be decreased in processing.

Enrichment of stable foods was accentuated during World War II principally as a result of the first order of the War Food administration which required the enrichment of all white flour. Thiamin, niacin, iron and later riboflavin were added in amounts approximately comparable to levels existing in whole wheat flour. Other foods improved nutritionally by the addition of vitamins were milk with vitamin D, salt with iodine, margarines with vitamin A and corn meal with thiamin, riboflavin, niacin and iron. The general policy of enriching certain stable foods was of far-reaching importance to improved public health.

Geneticists were also interested in improving the strains of various food products primarily to increase production and resistance to disease. During the decade, attention was directed to increasing nutrient content. Strains of corn were developed much richer in niacin than usual. Tomatoes and apples with greater ascorbic acid content were other examples of progress in this interesting and important development.

Voronov, Nikolai Nikolayevich

Voronov (1899—), soviet army officer, was born in Leningrad. He joined the Red army as a private in 1918, fought in the civil war and later studied at the Leningrad Red Banner Artillery school, the Artillery High school and the Frunze Military academy. Promoted to chief of soviet artillery in 1937, he reorganized the system of artillery training and established special gunnery schools. Under his supervision, soviet artillery became the chief offensive instrument of the Red army. Voronov employed big guns to pierce the Mannerheim line during the Soviet-Finnish war, 1939–40.

The important role played by soviet batteries in turning back the Germans from Moscow in Dec. 1941 led the soviet high command to lend more weight to cannon as an offensive weapon of land armies, and in succeeding days Voronov established a reserve pool of big guns. He drew upon this reserve during the battle of Stalingrad, in which he employed 300 to 400 guns per mile of front. He employed an even greater number of guns on the Kursk sector in July 1943, pulverizing the heavy German defenses. The soviet operations that resulted in the Orel-Bryansk breakthrough in 1943 and the investment of the Yelnya-Smolensk area were under Voronov's direct command.

Voronov was raised to the rank of a marshal of the soviet union after the Stalingrad battle and was awarded two Orders of Lenin and the Order of Suvorov, first class, for his achievements.

Voroshilov, Klementiy Efremovich

Voroshilov (1881–), soviet army officer, was born Feb. 4, 1881, in Verkhnyi, Ukraine. Joining the Social-Democratic party in 1903, he was exiled to Archangel four years later for revolutionary activities but escaped to Baku. After the Russian revolution in 1917, he was made defense chairman of Petrograd, assisted Felix Dzerzhinsky in organizing the Cheka (secret police), and led guerrilla units against German armies in the Ukraine.

Voroshilov became a member of the Communist party central committee and in 1925 was named people's commissar of the army and navy. After his elevation on May 8, 1940, to the vice premiership, he was succeeded by Marshal Semyon Timoshenko as defense commissar. Two months after the German invasion in June 1941, Marshal Voroshilov was in command of the northwestern front, which included the Leningrad area; in October of that

year he was charged with formation of new Russian armies.

He was later returned to the Leningrad area and was one of the soviet commanders there when the siege was broken in Jan. 1943. Voroshilov attended the Churchill-Stalin conference in Moscow in Aug. 1942, the Hull-Eden-Molotov conferences in Moscow and the Tehran parley in 1943. It was announced on Nov. 22, 1944, that Voroshilov had been relieved of his duties as a member of the eightman defense committee of the soviet union and had been replaced by Gen. Nikolai Bulganin. He was awarded the Order of Lenin in 1945.

Waesche, Russell Randolph

Waesche (1886-1946), U.S. coast guard officer, was born Jan. 6, 1886, at Thurmont, Md. He studied electrical engineering at Purdue university, Lafayette, Ind., and later entered the coast guard academy, from which he was graduated in 1906. He served as a line officer in the Atlantic, Pacific and Arctic waters and in 1916 became the first chief of the communications division. In 1928, he became chief ordnance officer in Washington and in 1931 reorganized the field forces of the service. He was appointed commandant of the coast guard in 1936, with the rank of rear admiral, and after the Neutrality act was passed in 1939, supervised the prevention of shipments of war materials from the United States to the European belligerents. Under his guidance, the coast guard grew to ten times its original size during World War II. On April 4, 1945, Waesche became the first full admiral of the coast guard and on Dec. 31, 1945, retired from the service. He was awarded the distinguished service medal. Waesche died at Bethesda, Md., Oct. 17, 1946.

Wages and Hours

Wage developments during the decade 1937-46 were the most significant of any period in U.S. history. Both in the United States and Canada, labour fought for higher wages, vacations with pay, night shift premiums, holiday pay and various other forms of financial benefits. The movement for shorter hours was emphasized less than during many previous decades.

Underlying these developments was the fact that fundamental changes had been in process in the U.S. and Canadian industrial systems which had raised the productivity of large numbers of wage earners and increased their value to their employers. The effects of these changes came to a head in the wage conflicts of 1937–46. Brief consideration of the basic changes mentioned is essential to understanding the wage developments of that decade.

Down to the early 20th century, the differentials between the wages paid to workmen in various occupations were based principally upon two factors, skill and scarcity. In a market plentifully supplied with labour, wages varied principally with skill—including knowledges, techniques and proficiencies, acquired only through a prolonged learning period, either as an apprentice or as a learner.

But with the development of modern methods of manufacturing, a new factor came into industry. More dramati-

cally in the mass production industries, but occurring also in thousands of factories not thought of as mass production plants, technological improvements (such as better plant layout and flow of work, highly productive machinery, line assembly and repetitive work on highly specialized tasks) multiplied the productivity of semiskilled and unskilled workers. The value of a worker was no longer determined almost exclusively by skill (which resulted in quality and also moderately increased quantity of work accomplished) but largely by quantity of output. Machines and other equipment, accurately adjusted and able to produce interchangeable units of product, could turn out quality work when manned by labour with only limited skill, and at the same time turn out many times as much work as could the skilled craftsman. Quantity of work produced had now made a multitude of semiskilled workers as valuable to their employers as skill had made the craftsman. It was the importance of quantity of output which underlay much of the successful efforts of workmen in such mass production industries as automobiles, rubber, electrical products and machinery industries, to make the rapid increase in earnings shown by the accompanying statistical tables.

Moreover, the same basic pattern which had been altering the wage situation in manufacturing was developing in transportation, mining, merchandising, large offices and other areas. Increases in the output of semiskilled and unskilled workers brought about by modernized management, equipment and work processes prepared the way for an upward shift in the wages of those groups, based primarily upon quantity of output rather than individual skill and knowledge.

Table I gives the average weekly earnings for July of each year, 1937-46, by industries. Reference to Table II on Average Hours per Week and Table III on Average Hourly Earnings, will enable the reader to determine the extent to which increases or decreases in weekly earnings resulted from variations in hours and the extent to which they were the result of changes in average hourly earnings.

Examination of Table I reveals a considerable variation in the extent to which the earnings in different industry

group advanced during the decade. The increase in manufactures in general, 1937–45, was approximately 80%, while hours worked increased during the same years by 16.1%. Hourly earnings increased 66.5%. The reader is cautioned that it is earnings, i.e., what the worker takes home, rather than wage rates, which are under discussion.

In iron and steel the weekly earnings increased, 1937–45, by 66%; in transportation equipment (in which aircraft manufacturers expanded enormously after 1940) 93%; in lumber 61%; in textile products, 83.5%; in anthracite coal, 108.5%; in bituminous coal, 128.5%; in building, 78%. Similar diversity appeared in the case of other industries, and in each case it is

necessary to check the facts given in all three tables in order to determine the relative importance of increased hours and increased hourly earnings in the causation of the increase in weekly earnings.

Another caution is necessary. Much of the increase in weekly earnings resulted from the payment of shift premiums of five cents to ten cents per hour on night shifts and from payment of overtime rates for a substantial proportion of the work done during the war years. Overtime was paid, ordinarily, at the rate of one and one-half times the regular earning rate of the employee for hours in excess of the normal shift up to a period twice the length of the normal shift; e.g., from the 8th to the 16th hour of work; and also for work on the 6th day worked in succession. It was paid at double time for hours in excess of the number covered by time and a half, for the seventh consecutive day worked, and for wartime work on holidays. During the years 1937-41, time-and-a-half was paid for Saturday work and double time for Sunday work in a large number of industries, but the amount of such overtime was far less than during the war. The government ordered during the war that overtime apply to the sixth and seventh days rather than Saturday and Sunday, because those days had to be incorporated into so many regular shifts during the war emergency.

The increase in average weekly hours worked during the war years (Table II) may be less than many citizens thought. The reasons were as follows: (1) three-shift operation was the principal means used to increase the production in factories; it made possible continuous, or nearly continuous operation of the plant, though it was not possible in most factories to get an adequate supply of labour, either in numbers or in skills and abilities to operate the entire plant three shifts; (2) part of the labour force worked only normal hours and the average minimized the length of the working week of the workers who did work overtime; (3) absenteeism, on account of fatigue and need for some relaxation from continuous long weeks, cut down the actual hours worked below the scheduled averaged hours

*New series started April 1946, figures not strictly comparable because of changes in sample of firms reporting. Changes produce but small alterations in data, however.

In 1943 the composition of the industry group was changed by separating automobiles from transportation equipment; apparel from textile products; telegraph from telephone and telegraph in 1945; and petroleum products from chemical products.

of operation of the employees' departments.

The movement of hourly earnings up to a dollar an hour and higher in many industries during the late war years and 1946, probably represented a permanent shift in hourly earnings in the United States (Table III). It reflects the success of labour in the mass production and other modernized industries in forcing or inducing management to compensate their employees in some proportion

Table IV.—Great Britain Number of Individuals Affected by Net Increases and Net Decreases in Wages by Years, 1939-46.

Year	ear					Number of I Reported as		Estimated Net Weekly Amount of Change in Wages				
							1	Vet Increases	Net Decreases	Increase	Decrease	
1939								6,150,000	65.800	£980.900	18,500	
1940								8,780,000		2,633,000		
1941								8,855,000		2,485,000		
1942			٠					6,692,000	400	1,706,000	50	
1943								7,187,000	152,100	1,619,000	2,900	
1944								8.512.000	300	1.956.000	500	
1945								7.164.000	400	1.756,000	50	

*This is "an approximate" number. Certain large groups are not covered by the statistics. Figures afford only a general indication of movements of wages.

to their productivity in such industries, even when the increase in productivity resulted from management's efforts more than from increases in either the effort or the skill of the wage carners.

Table III shows a sharp upward shift of hourly carnings in all industries. The intensity of labour's drive for still higher hourly earnings, characteristic of the industrial relations scene in 1946 in the United States, Canada and Great Britain alike, augured a possibly permanent substantial gain in wage earners' incomes from which they would benefit most if postwar progress in technology and the more intense competition of subsequent years brought down commodity price levels.

Great Britain.-Table IV shows the number of individuals in a substantial number of British industries who received increases in pay each year from 1939 through 1945. It was not possible to compute with accuracy the typical amounts of increase received, but the table shows a steady and substantial upward trend of wages during the war period-and the fact that increases were widely distributed.

Table V gives a closer approximation of the amount of the increases received during the period. The starting date for fig-

ures given on this table is Oct. 1938, but this is of little significance when comparison is made of the evidence given in the two tables. Examination of the monthly reports on wage increases in the Ministry of Labour Gazette (London) reveals that the difference between wage figures on Oct. 1938 and the average for 1939 was small. It is more than counterbalanced by the fact that Table V ends with 1945. There was fully as much increase during 1945 as there was between Oct. 1938 and the 1939 average. It is sound, therefore, to use Table V as an index of what happened between 1939 and 1945.

One significant fact stands out in the table—the much greater percentage increase in women's wages than in men's, which produced the result that women's wages had gained on men's wages by the end of World War II. The more rapid rise in women's wages was forced by the necessity of offering wages which would attract into industry some millions of new female employees to replace men called into the armed services and to make possible the necessary expansion of industries producing war materials.

Table V.—Great Britain Average Weekly Earnings, Male and Female, by Industries, Jan. 1945, and Percentage Increase since Oct. 1938.

Source: Ministry of Labour Gazette. London, Aug. 1945.

The industries of particular importance for war production showed the largest percentage increases in women's rates.

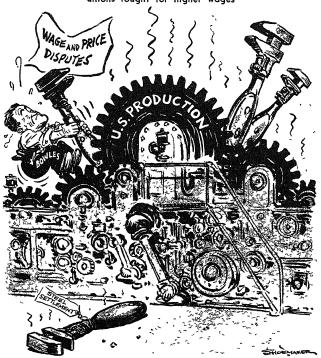

An average increase of 73% in men's weekly earnings and of 94% in women's weekly earnings during a period of a little more than 6 years was a wage rise of exceptional rapidity.

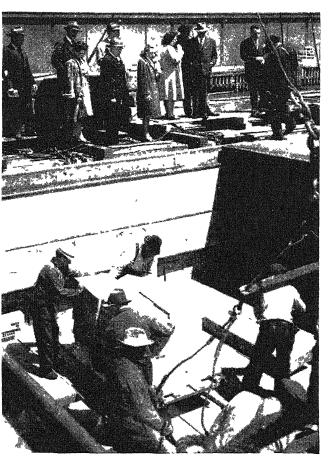

It resulted, of course, from three principal factors: increases in hourly rates and piece work prices; the shifting of many thousands of workers into more highly paid classifications; and the increased hours, which frequently carried overtime premium rates.

Canada.—Two interesting series on wages were published by the Canadian department of labour, neither of which covered all of the decade of 1937–46. Table VII furnishes, by index numbers, the trend of wage rates, by industry groups.

The figures are for the years 1937 through 1944. Tabulations subsequent to 1944 had not been made prior to Jan. 1947.

Table VII shows that in 1937–38, wage rates were lower than in 1939, except in the coal mining and steam railway industries. From 1939 through 1944 wage rates rose, on the average, 37.5 points. The largest increase was in coal mining (46 points), and the smallest was in the steam railways (24.4).

Compiled from Canadian Labour Cazette, Sept. 1946.

Table VIII gives the average weekly earnings in major industry groups from 1941 to 1946. The table shows that from 1944 to July 1946 there was not much change in weekly earnings. Since hours worked and the amount of overtime premiums decreased between 1944 and 1946, only increases in rates could have kept 1946 earnings up to approximately the 1944–45 level.

Both 1945 and 1946 were characterized by vigorous efforts of labour unions, especially in the basic industries, to get increases in rates to counterbalance the reductions in earnings that would result from reduced overtime. Wainwright, Jonathan Mayhew

Wainwright (1883—), U.S. army officer, was born Aug. 23, 1883, in Walla Walla, Wash. A graduate of the U.S. Military academy, West Point, N.Y. (1906), he served in the Philippines during the Moro uprisings, 1909, and in France during World War I. He was stationed in the Philippines during World War II, and was second in command to General Douglas MacArthur when the Japanese invaded the islands in Dec. 1941. After MacArthur was sent to Australia, Wainwright took over command (March 17, 1942) of the U.S.-Filipino armies in Bataan peninsula. Two days later Pres. F. D. Roosevelt raised him to the rank of a lieutenant general.

Wainwright retired in April with his outnumbered U.S.-Filipino army from Bataan to Corregidor (q.v.). He held out under a concentrated air and artillery bombardment until May 6, when he was compelled to surrender because he had run out of food and ammunition and his exhausted forces were no longer able to fight.

After signing the surrender terms dictated by Gen. Maraharu Homma, Wainwright was moved to a prison camp in the Philippines, thence to three camps in Formosa and lastly to two in Manchuria. Shortly after Hirohito's surrender broadcast (Aug. 15, 1945), a U.S. detach-

Reception for General Jonathan Wainwright in New York city on Sept. 13, 1945. Seated in the first car beside Mayor La Guardia, the general is shown at the head of a parade passing along lower Broadway in the city's financial district

ment in Manchuria released him from captivity and the general took part in the Japanese surrender ceremonies aboard the battleship "Missouri" in Tokyo bay, Sept. 2. His nomination to the rank of a full general was approved Sept. 6. Wainwright returned to the United States, Sept. 8, 1945, and was given ovations on his arrival in San Francisco, Washington, D.C., and New York city.

On Sept. 28, 1945, Wainwright was named commanding general of the eastern defense command; in Jan. 1946 he was given command of the 4th U.S. army.

Wake Island

Tiny, isolated Wake island was first occupied in 1935 when Pan American Airways established a seaplane base and overnight passenger facilities serving its trans-Pacific air route. Somewhat later the U.S. navy decided to develop it into an air and submarine base when it was evident that Japan was inexorably committed to a policy of aggression and conquest in the Pacific. On the eve of

the attack on Pearl Harbor, the base had been half completed by the 1,146 civilian employees of contractors, Pacific naval air bases, and the navy, in late Nov. 1941, had sent in Commander W. S. Cunningham, as island commander and Major J. P. S. Devereux, with his 1st marine defense battalion of 379 men and six 5-inch coast defense and twelve 3-inch anti-aircraft guns. A task force organized about the carrier "Enterprise" and commanded by Vice Admiral William Frederick Halsey made a secret high speed run from Hawaii to Wake for the purpose of delivering marine fighting squadron (V.M.F.) 211 consisting of 12 Wildcats and 59 men (pilots and ground crews), under Major P. A. Putnam; the planes were flown ashore on Dec. 4, 1941.

The marines were woefully unprepared in numbers, training, equipment and supplies for the catastrophe which befell them at 11:58 A.M. on Dec. 8 (2:28 P.M., Dec. 7, Hawaiian time) in the form of an 18-plane Japanese air attack. A four-plane patrol had been maintained after receiving news of the attack on Pearl Harbor that same morning at 6:50 A.M., yet the lack of detection devices and the low clouds made the attack a complete surprise. Thirty-three men were killed and seven of the eight precious planes on the ground were severely damaged or destroyed during a few horrible minutes.

On Dec. 11 a Japanese task force of three cruisers, four destroyers, two patrol craft and two transports attempted to capture the island. The marines held fire until the ranges were near 5,000 yards, when they opened up with tremendous effect. Aided by planes which, by a lucky chance, started an uncontrollable fire on a cruiser, and a

Jap-held Wake Island, target of one of the most concentrated air raids of World War II on Oct. 5-6, 1943, when U.S. naval planes and ships bombed and shelled it with more than 700 tons of explosives

submarine which torpedoed a transport, the garrison sank 5 ships and inflicted casualties of 5,350 men while they suffered not a single casualty.

On all but two days the Japs sent over flights of bombers numbering between 18 and 51, each of which was opposed by all remaining flyable Wildcats, sometimes only one. The last was expended on Dec. 22, but not until the gallant airmen had destroyed 12 Jap planes, 1 light cruiser and 1 submarine. The numerous bombings were useful to the Japanese principally in the elimination of the defending planes and the exhaustion of the ground forces

On Dec. 23 the same task force which had been repulsed on the 11th returned to the assault after having been repaired at Kwajalein and re-enforced by four heavy cruisers and two destroyers. An aircraft carrier operated in support but separately. At 3 A.M. the two patrol craft (small destroyers) and five landing craft were sacrificed by being run on the south reef to get ashore the 1,100 troops they bore. They were opposed at the landing by only 85 marines, since the remainder were obliged to man the guns variously located about the island. At this time Cunningham sent his much-quoted dispatch, "Enemy has landed, issue in doubt." After 6 hours of furious fighting, during which the marines lost only about 20 men but killed 130 Japanese, the island commander saw further resistance was useless and yielded in the interest of humanity.

The fighting at Wake had no considerable military consequence; its proximity to numerous and stronger Japanese bases determined that it probably would have fallen later even if the marines had been succoured, as the entire nation fervently prayed would happen. The battle was of supreme moment in a spiritual sense, however, for there United

522 States forces stood before an overpowering enemy who had had an unparalleled succession of easy triumphs in all its other theatres, and proclaimed that, regardless of odds, they would have to be crushed into submission. Thus the American people, powerless to help and heartbroken that the garrison had to be abandoned to its fate, had begun to doubt their ability to cope with the Japanese, but derived new hope and inspiration from the dauntless defenders of the island, and those people went on to fight a series of campaigns over the entire Pacific and to reap victories never before recorded in history.

The Japanese captured an estimated 1,603 Americans on Wake. All but 98 were evacuated to China and Japan by Sept. 1942, when it became too dangerous to risk ships for this purpose. The Japanese fortified Otorishima, as they renamed Wake, to the utmost, moving in planes, guns, tanks, PT boats and 4,100 men under Rear Admiral Sakaibara.

Admiral Halsey attacked the island Feb. 24, 1942, with the same task force which delivered marine fighting squadron 211 the previous Dec. 4. As the Navy increased in strength and bases to the south in the Marshalls were captured, air and sea activity against the by-passed island was intensified to the establishment of an ideal blockade. It was bombarded five times by carrier task forces, and by early 1944 hardly a day passed that the island did not receive a bombing or reconnaissance mission. No Japanese ship except submarines visited it after Dec. 1943. The 1esults were the complete devastation of the island, its uselessness for Japanese military purposes and the death of some 600 Japanese from wounds and of 1,288 from

Brigadier General Lawson H. M. Sanderson, accepted the Japanese surrender Sept. 4, 1945. The garrison was found greatly debilitated from malnutrition. Liberal U.S. treatment, food and medicines soon restored all but the few who were too far gone. Immediately the navy moved in the 85th naval construction battalion and acorn 57 to build an air base, which was commissioned Nov. 1, 1945, Captain E. A. Junghans, commanding. At once the naval air transport service and the air transport command began to use the base as a stop on the route to Tokyo in support of the occupation of Japan, and the first Pan American plane returned Nov. 25, 1945, to make preparations for re-establishment of the prewar route.

After the surrender an attempt was made to find the missing 98 civilians. At first the Japanese all told the same self-absolving story which was not given credence. At length a confession revealed that the Americans had been executed Oct. 7, 1943, when the island was under bombardment by a U.S. task force. The admiral feared the attack would develop into an assault and desired to remove a possible menace to his interior security. For this crime the admiral and two other officers were sentenced to hanging by a military commission. (E. A. Js.)

Walker, Frank Comerford

Walker (1886-), U.S. lawyer, politician and government official, was born May 30, 1886, at Plymouth, Pa. A student at Gonzaga university in Spokane, Wash. (1903o6), he later attended Notre Dame university, South Bend. Ind., where he received his law degree in 1909. He was admitted to the Montana bar in 1909 and four years later was elected to the state legislature. He became actively identified with national politics in 1932, when he became treasurer of the Democratic National committee. The following year, he was made secretary of President F. D. Roosevelt's executive council and was later executive director of the National Emergency council. On Aug. 31, 1940, Walker was named by Roosevelt to succeed James A. Farley as postmaster general, and in Jan. 1943 he was appointed chairman of the Democratic National committee, a post he held until Jan. 1944. He resigned as postmaster general June 30, 1945. On Dec. 19 of that year, President Harry Truman named Walker as one of the U.S. representatives to the United Nations general assembly meeting in London; the nomination was confirmed by the senate the following day (Dec. 20, 1945). On Jan. 7, 1946, he was assigned to the general assembly's legal committee.

Wallace, Henry Agard

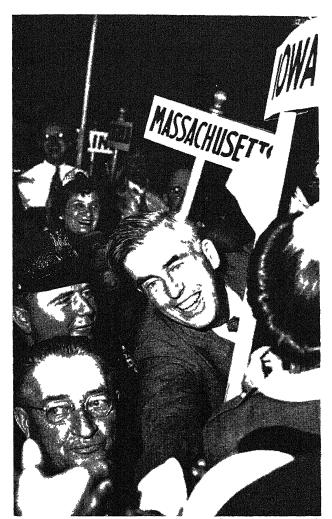

), U.S. government official, was Wallace (1888– born Oct. 7, 1888, in Adair county, Ia., the son of H. C. Wallace, secretary of agriculture in the Harding and Coolidge administrations. Upon graduating from Iowa State College of Agriculture and Mechanical Arts, Ames, Ia., in 1910, he joined his grandfather's paper, Wallace's Farmer, as associate editor, becoming full editor in 1924. Wallace was secretary of agriculture in the Roosevelt administration from March 4, 1933 to Sept. 5, 1940, when he resigned to run for the vice-presidency. He was inaugurated with F. D. Roosevelt, Jan. 20, 1941. On July 31, 1941, he was appointed head of the Economic Desense board (later the Board of Economic Warfare) and (Aug. 28) chairman of the Supply Priorities and Allocations board.

Toward the end of 1942, a dispute developed between Wallace and Jesse Jones, secretary of commerce and chairman of the Reconstruction Finance corporation. The feud broke out into the open on June 29, 1943, when Wallace accused Jones of obstructing the war effort by hampering the BEW in its efforts to secure vital materials from foreign sources. Jones denied Wallace's accusations and came forth with charges of his own. The sensational intra-agency quarrel was quickly silenced on July 15, 1943, by Pies. Roosevelt, who abolished the BEW and withdrew from the control of the RFC all corporations which had been engaged in financing foreign purchases and imports.

Early in 1944, Wallace went on missions to China and the Asiatic parts of the soviet union. He returned in time for the Democratic National convention in Chicago, Ill., where he was defeated for renomination for the vice-presidency; although the president forsook Wallace by declaring that either Harry S. Truman or William O. Douglas would be acceptable candidates to him if Wallace were not renominated, the retiring vice-president actively stumped for Roosevelt's re-election in the 1944 campaign.

On Jan. 22, 1945, Roosevelt nominated Wallace to succeed Jesse Jones as secretary of commerce and directing head of the RFC. While the senate confirmed his nomination as secretary of commerce on March 1, 1945, his nomination as RFC head was rejected.

On Sept. 12, 1946, Wallace became involved in an intracabinet controversy when in a New York address he denounced the administration's foreign policy with regard to the soviet union, warned that a "get tough with Russia policy" would backfire and scored British "imperialism" in the middle east. The speech caused an international furore because of Pres. Truman's subsequent statement that he had read and endorsed it. Two days later, Truman backed down on his statement, explaining that while he

Henry A. Wallace greeting delegates at the Democratic party's national convention which opened on July 19, 1944, in Chicago to nominate candidates for the presidential election. Wallace failed to secure re-nomination for the vice-presidency

supported Wallace's right to make the speech. he did not intend to indicate that he approved the speech as "constituting a statement of the foreign policy of this country."

At the request of the president, Wallace handed in his resignation as secretary of commerce, Sept. 20, 1946. After his resignation, Wallace became editor in chief of *The New Republic*.

Wang Ching-wei

Wang (1885?-1944), Chinese statesman, was born at Canton. He studied law in Japan and while there became interested in the revolutionary program of Sun Yat-sen, with whom he later became acquainted. By 1924 he was Sun Yat-sen's chief adviser and in 1925, after Sun's death, chairman of the Kuomintang's political council. Two years later he resigned after a quarrel with Chiang Kaishek. Expelled from the Kuomintang in 1929 for plotting against the Nanking government, he was reinstated two years later. He was president of the executive yuan, 1932-35, and minister of foreign affairs, 1933-35. In 1939 he was again ousted by Chiang for making peace overtures to

Japan. Wang then set up a puppet government, March 30, 1940, in Nanking under sponsorship of the Japanese army of occupation. Wang's regime, "the National government of China," was officially recognized by Japan in a treaty signed Nov. 30, 1940. Chiang's answer was the offer of a reward of 100,000 Chinese dollars for the capture of Wang. Dutifully following the dictates of his Japanese overlords, Wang declared war on the United States and Great Britain on Jan. 9, 1943. Wang died of diabetes in a Japanese hospital, Nov. 10, 1944, according to an announcement by Japanese Premier Kuniaki Koiso.

Wang Shih-chieh

Wang (1891—), Chinese statesman, was born in 1891 in Hupeh province. He joined the Chinese revolutionaries who forced the Manchu abdication in 1912. After the establishment of Sun Yat-sen's republican regime, Wang went to England, where he graduated from the University of London in 1917. He later attended the University of Paris, receiving his doctor of law degree in 1920. On returning to China, he joined the faculty of the Peking National university as a lecturer of comparative constitutional law, becoming dean of the law faculty.

In 1928, Wang was appointed a member of the Permanent Court of Arbitration at The Hague. In 1929, he was made a member of the legislative yuan and also president of the National Wuhan university at Wuchang. His steady rise in the Chinese educational movement was climaxed in 1933 with his appointment as minister of education. In 1939, he was given the additional portfolio of minister of information, serving until 1942. Two years later he was reappointed to this post.

Wang was named by Chiang Kai-shek as the national government's chief negotiator in dealing with the problem of the Chinese Communists in 1944. Appointed foreign minister on July 30, 1945, Wang attended the meetings of the Allied Council of Foreign Ministers in London the following September.

War and Defense Agencies

The general pattern of federal administration in the United States for defense and war was one of establishing new agencies or units to carry on the principal wartime functions rather than assigning major emergency tasks to existing agencies. While the activities of the permanent agencies were greatly enlarged and accelerated, major responsibilities in such fields as production, transportation, manpower and public information were given to organizations created to meet the emergency.

The organizational basis for the development of wartime administrative machinery was in the Reorganization Act of 1939. Under the provision of this act the president, with the approval of congress, reassigned certain functions so that the number of agencies would be reduced and more efficient operation would result. Under Reorganization Plans No. I and No. II, effective July 1, 1939, and an executive order of Sept. 8, 1939, a number of activities were grouped in the executive office of the president: the

"Reduce a Little, and Then Look Around," was a suggested remedy for the U.S. labour shortage in 1942. The cartoon was by Knox of the Memphis Commercial Appeal

Budget Bureau (with enlarged responsibilities in the field of administrative management); the National Resources Planning board; the Office of Government Reports; the Liaison Office for Personnel Management; and the immediate White House office. The executive order of Sept. 8 also provided that there should be in the executive office, "in the event of a national emergency or threat of a national emergency, such office for emergency management as the President shall determine." This provision served as the legal basis for the erection of the major part of the government's structure for the prosecution of the war.

The Office for Emergency Management was formally established in the executive office of the president by administrative order on May 25, 1940. This office served two purposes: it provided the president with assistance in coordinating and directing the emergency agencies (through the Liaison Officer for Emergency Management); and it provided authority and an organizational location for many of the new agencies which had to be created.

The Advisory Commission to the Council of National Defense was re-established by the president on May 29, 1940, under statutory authority remaining from World War I for a Council of National Defense and an advisory commission "of not more than seven persons, each of whom shall have some special knowledge of some industry, public utility, or the development of some natural resource, or be otherwise specially qualified." The council (the secretaries of war, navy, interior, agriculture, commerce and labour) remained dormant; the commission consisted of advisers for industrial materials, industrial production, employment, farm products, transportation, price stabilization and consumer protection, with the Liaison Officer for Emergency Management serving as commission secretary. Several subordinate offices established by the commission

served as the forerunners of later agencies or units; these included the Co-ordinator of National Defense Purchases, the Small Business Activities office, the Bureau of Research and Statistics, the Division of State and Local Co-operation, a Defense Housing co-ordinator, the Office of Co-ordination of Commercial and Cultural Relations between the American Republics and a Director of Information.

As preparations for war intensified, the advisory status of the commission became increasingly unrealistic, and the need increased for agencies with greater powers and more effective organization. Beginning early in 1941, functions of the commission were shifted in rapid succession.

Central Co-ordination; Central Services.—The Division of Central Administrative Services was established in the Office for Emergency Management pursuant to a letter of Feb. 28, 1941, from the president to the Liaison Officer for Emergency Management, to provide central budgetary, fiscal and administrative services for the Office for Emergency Management and its constituent agencies. As these agencies grew in size, they gradually assumed control of their own services, and an executive order of Aug. 25, 1944, terminated the division as of Nov. 30, 1944.

The Office of Economic Stabilization was established within the Office for Emergency Management on Oct. 3, 1942. Its responsibility was "to control so far as possible the inflationary tendencies and the dislocations attendant thereon which threatened the military effort and the domestic economic structure." An Economic Stabilization board was established by the same order with the director designated as chairman. This agency did not supersede other agencies but was expected to formulate general programs and reconcile conflicting policies and disagreements among them. An executive order of Sept. 20, 1945, abolished the office and transferred its activities to the Office of War Mobilization and Reconversion, where its functions were carried on under a stabilization administrator. The office was re-established on Feb. 21, 1946.1

The Office of War Mobilization was established by an executive order of May 27, 1943, to provide government-wide co-ordination and execution of war policies on a broader basis than the economic field covered by the Office of Economic Stabilization. Powers assigned to it included: development of unified programs and policies for maximum use of the nation's resources; co-ordination of the activities of federal agencies concerned with production, procurement, distribution and transportation; and the issuance of directives necessary to achieve these ends. The office operated with a relatively small staff as a policyforming and co-ordinating agency; operations remained with the emergency agencies already handling them.

The Office of War Mobilization and Reconversion was created by the War Mobilization and Reconversion act approved Oct. 3, 1944. This legislation transferred to the new agency the functions of the Office of War Mobilization (which was terminated) and two existing agencies: the Office of Contract Settlement and the Re-employment and Retraining administration. This office exercised a general policy-forming and co-ordinative function similar to that of the Office of War Mobilization, but this function was strengthened by certain legislative grants of power extended to problems of the reconversion to peace, and enlarged by the addition of certain subordinate activities.²

¹The Office of Economic Stabilization was consolidated into the Office of Temporary Controls by the executive order creating that office.

The Office of War Mobilization and Reconversion was consolidated into the Office of Temporary Controls by the executive order creating that office. Certain functions of the director of war mobilization and reconversion were transferred to the president, the secretary of commerce and the reconstituted Office of Government Report by the same executive order

The Committee for Congested Production Areas was established by an executive order of April 7, 1943, to provide for the co-ordination of federal, state and local government activities in congested areas. Working through a series of area offices, the committee served to bring to the attention of Washington officials problems of these areas that needed special attention. It was terminated on Dec. 31, 1944, by act of congress.³

Production, Supply, Distribution, Price Control.—The Office of Production Management was established in the Office for Emergency Management by executive order on Jan. 7, 1941. The functions of the Advisory Commission to the Council of National Defense relating to production were transferred to it, including the activities of the Coordinator of National Defense Purchases, the Small Business Activities office, the Bureau of Research and Statistics and the activities of the Advisors on Industrial Materials and Industrial Production. The agency was given broad powers over the production and supply of materials required for national defense and over the co-ordination of activities throughout the government relating to production. Its functions were transferred to the War Production board by executive order on Jan. 24, 1942.

The Office of Price Administration was originally established as the Office of Price Administration and Civilian Supply in the Office for Emergency Management by executive order on April 11, 1941. This office inherited the functions and staff of the Advisor on Price Stabilization of the Advisory Commission to the Council of National Defense. An executive order of Aug. 28, 1941, changed its name to the Office of Price Administration and transferred its civilian supply function to the War Production board. The Emergency Price Control Act of 1942, Jan. 30, 1942, established OPA as an independent agency. Its principal functions were price control, rent control and rationing. (See also PRICE ADMINISTRATION, OFFICE OF; PRICES; RATIONING.)

The Supply Priorities and Allocations board was established in the Office for Emergency Management by executive order of Aug. 28, 1941, as a policy group superimposed over the Office of Production Management. It consisted of the chairman of the Economic Defense board, the director general and associate director general of the Office of Production Management, the price administrator, the secretary of war, the secretary of the navy and the special assistant to the president supervising the lend-lease program. Its purpose was to assure unity of policy and to co-ordinate the consideration of all relevant factors involved in the supply and allocation of materials and commodities to meet military and civilian needs. It was abolished by an executive order of Jan. 16, 1942, which transferred its functions to the War Production board.

The War Production board was established in the Office for Emergency Management by executive order of Jan. 16, 1942. This order transferred to WPB the functions of the Supply Priorities and Allocations board, and a subsequent order of Jan. 24, 1942, transferred to the new agency the functions of the Office of Production Management. The board was largely advisory; all administrative powers of the agency were placed in the hands of the chairman. The WPB was the principal agency in the field of production

and supply until Oct. 4, 1945, when it was terminated and its functions transferred to the *Civilian Production Administration*. ⁵ (See also WAR PRODUCTION.)

The Petroleum Administration for War was established by executive order of Dec. 2, 1942, which designated the secretary of the interior as administrator ex officio. This agency had been preceded by an Office of Petroleum Coordinator for War, established by presidential letter of May 28, 1941, with the secretary of the interior as coordinator. This earlier office was authorized to co-ordinate all federal defense activities concerned with the production, refining, transporting and marketing of petroleum; increased administrative powers were added by the executive order creating the successor agency. The Petroleum Administration for War dealt with a wide range of problems related to the production, distribution and use of petroleum products, particularly in the field of relations with the industry and co-ordination of government agencies.

The Solid Fuels Administration for War was established in the department of the interior by executive order of April 19, 1943, which designated the secretary of the interior as administrator. This agency absorbed the Office of the Solid Fuels Co-ordinator for War (established as Office of Solid Fuels Co-ordinator for National Defense by presidential letter on Nov. 5, 1941; title changed on May 25, 1942), a largely advisory office also under the direction of the secretary of the interior. The Solid Fuels Administration for War had powers over coal and certain other solid fuels similar to those of PAW over petroleum products. One of its activities was the supervision of operations when mines were placed under government control pursuant to the War Labor Disputes act of June 25, 1943. This control was handled from July 1, 1943, to Aug. 19, 1944, by a Coal Mines administration in the department of the interior; on the latter date that unit was abolished, and its functions were transferred to Solid Fuels Administration for War. (See also Coal; Petroleum.)

The Office of Rubber Director was established within the War Production board by executive order of Sept. 17, 1942. The director was given broad authority over all phases of the nation's rubber program, including direction of the existing units in the War Production board and its Division of Civilian Supply dealing with rubber and rubber products. In Sept. 1944, the office was replaced by a Rubber bureau under the WPB operations vice-chairman, and the operations of the new office were brought more closely into the WPB mechanism. (See also Rubber.)

The Reconstruction Finance corporation (q.v.) provided convenient machinery for handling a number of situations in which the war agencies needed financial facilities for procurement, stock-piling, insurance and the like. One device used in a number of cases was the creation of government corporations under the auspices of RFC. These corporations included the following, the dates in parentheses being dates of their establishment: Metals Reserve Co. (June 28, 1940); Rubber Reserve Co. (June 28, 1940); Defense Plant Corp. (Aug. 22, 1940); Defense Supplies Corp. (Aug. 29, 1940); Rubber Development Corp. (Nov. 1944, later transferred to Office of Economic Warfare); War Emergency Pipe Lines, Inc. (Sept. 8, 1941); War Damage Corp. (incorporated Dec. 13, 1941, as War Insurance Corp.); United States Commercial Co. (March 26, 1942); Colonial Mica Corp. (April 17, 1942); Copper Recovery

^{*}The Office of Temporary Controls was established in the Office for Emergency Management by an executive order of Dec 12, 1946 The Office of Economic Stabilization, the Office of Price Administration and the Civilian Production Administration were transferred to it. The Office of War Mobilization and Reconversion was transferred to it, with the exception of certain powers of the director of war mobilization and reconversion, which were transferred to the president, the secretary of commerce, and the reconstituted Office of Government Reports.

⁴The OPA was consolidated into the Office of Temporary Controls by an executive order of Dec. 12, 1946.

⁶The Civilian Production Administration was in turn transferred to the Office of Temporary Controls by executive order of Dec. 12, 1946.

Corp. (April 21, 1942); Steel Recovery Corp. (July 18, 1942); War Materials, Inc. (Aug. 24, 1942); and Petroleum Reserves Corp. (June 30, 1943, later transferred to Office of Economic Warfare).

The Smaller War Plants corporation was created by act of congress approved June 11, 1942. Attention to the problems of small business had begun on Oct. 23, 1940, when a Small Business Activities office was established under the Advisory Commission to the Council of National Defense. A defense contract service was established in the Office of Production Management, and an executive order of Sept. 4, 1941, raised its status to that of a division of contract distribution. This division engaged in various measures, including a spectacular publicity campaign, to assist small manufacturers in war production. The Smaller War Plants corporation, which succeeded to the field of action of the Contract Distribution division, engaged in assistance to small business through publicity, loans, provision of information, liaison with other government agencies and other methods. The corporation was terminated by executive order of Dec. 27, 1945, and its functions were transferred to the Reconstruction Finance corporation and the department of commerce.

International Economic Activities.-International economic matters, including co-ordination of foreign purchases in the United States, provision of supplies for the allies, administration of alien property, and matters of economic warfare, were handled at first by a number of relatively small and informal devices. In the field of purchasing by allies of the United States, the president established, on Dec. 6, 1939, an Interdepartmental Committee for Co-ordination of Foreign and Domestic Military Purchases. This committee, generally known as the president's liaison committee, consisted of representatives of the war, navy and treasury departments. It operated under the direction of the secretary of the treasury to locate sources of supply, and to iron out competition between foreign purchasing programs and U.S. procurement activities. On May 2, 1941, the Division of Defense Aid Reports was established in the Office for Emergency Management. This division co-ordinated requests for aid from other countries, checked records and accounts, and maintained liaison among the departments concerned with the execution of the program. As policies became established, the division increased its activity in implementing them. The division was abolished by executive order of Oct. 28, 1941, which created the Office of Lend-Lease Administration.

The Office of Lend-Lease Administration was established by executive order of Oct. 28, 1941, to replace the Division of Defense Aid Reports within the Office for Emergency Management. This agency administered the Lend-Lease act, providing for the manufacture, procurement, lending, leasing, or selling of defense articles to such nations as were vital to the defense of the United States. This office was consolidated into the Foreign Economic administration by executive order of Sept. 25, 1943.

Export controls had other aspects besides the problem of co-ordinating foreign purchases with the U.S. domestic production program. Initially, the government possessed only a limited power to control exports, and it was necessary to broaden this authority so that materials could be controlled which were required for U.S. production, and so that critical materials would not be shipped to aggressor countries. On July 2, 1940, the president approved an act which permitted him to prohibit or curtail the export of any military equipment, machinery, tools, materials or

"End of the Line." A reference by Hal Coffman of the Ft. Worth Star-Telegram to the end of U.S. lend-lease shipments on Aug. 21, 1945, which left many Allied nations seeking new sources of foodstuffs and other materials

supplies necessary for the manufacture of military goods. On the same day, by military order, he designated an administrator of export control. The duties of the administrator included the control of export materials and commodities that were designated as essential to defense and could not be exported except under licence. These powers were transferred to the Economic Defense board under an executive order of Sept. 15, 1941, where they were continued in an Office of Export Control. (See also Lend-Lease.)

The Economic Defense board was established by executive order of July 30, 1941. The board consisted of the vice-president, who acted as chairman, and the secretaries of state, treasury, war, navy, agriculture, commerce and the attorney-general. Originally a policy co-ordinating body, it moved into the area of operations on Sept. 15, 1941, when an executive order transferred to it the functions and staff of the Office of Export Control and of the Division of Controls of the department of state. The board was reconstituted in Dec. 1941, as the Board of Economic Warfare.

The Board of Economic Warfare was established by an executive order of Dec. 17, 1941, as the successor to the Economic Defense board. It was responsible for developing and co-ordinating policies, plans and programs to protect and strengthen the international economic relations of the United States in the interests of national defense. The board was terminated when the Office of Economic Warfare was created.

The Office of Economic Warfare was established in the Office for Emergency Management by executive order on July 15, 1943; it assumed the functions of the Board of

Economic Warfare. At the time of its creation, there were transferred to it the U.S. Commercial Co., the Rubber Development Corp., the Petroleum Reserve Corp., the Export-Import Bank of Washington and other subsidiaries of the Reconstruction Finance Corp. and the department of commerce engaged in financing foreign purchases and imports. OEW was succeeded by the Foreign Economic administration in Sept. 1943.

The Foreign Economic administration was established within the Office for Emergency Management by executive order on Sept. 25, 1943, to unify and consolidate activities relating to foreign economic affairs. The order transferred to FEA the Office of Lend-Lease Administration, the Office of Foreign Relief and Rehabilitation Operations, the Office of Economic Warfare (together with the agencies earlier transferred to that office) and the foreign economic operations of the Office of Foreign Economic Coordination in the state department. A later executive order (Oct. 6, 1943) transferred to FEA the foreign procurement activities of the War Food administration and the Commodity Credit corporation. The agency was terminated by an executive order of Sept. 27, 1945, and its functions were transferred to the departments of state, commerce and agriculture, and to the Reconstruction Finance corporation.

The Office of Foreign Relief and Rehabilitation Operations was established by order of the state department on Dec. 4, 1942, as announced by the White House in a press release on Nov. 21, 1942. The office was organized to plan and administer measures for the relief and rehabilitation abroad of victims of war, including the provision of food, housing, clothing and medical supplies in territories occupied by the armed forces of the United Nations. While the office was established within the department of state, it exercised a large degree of freedom of action. It was transferred to the Foreign Economic administration by executive order of Sept. 25, 1943, which established that agency.

The Office of Alien Property Custodian was established in the Office for Emergency Management by executive order of March 11, 1942, under the authority of the Trading with the Enemy Act of 1917. The agency had authority over businesses, patents, securities and other properties of enemy governments or nationals, with power to hold, use, administer, or sell such property under certain conditions. The office was transferred to the department of justice by executive order of Oct. 14, 1946.

Foreign Funds Control, an office within the treasury department, was established by that department Sept. 22, 1942. Among its activities were: the freezing of \$8,500,000,000 held in the United States by persons in enemy-occupied, liberated and European neutral countries; the investigation and regulation of international financial transactions; co-operation, through the department of state, with other American republics in the control of enemy property and transactions; and participation in the restrictions on trading-with-the-enemy under the Trading with the Enemy act.

Transportation.—The Office of Defense Transportation was established in the Office for Emergency Management by executive order of Dec. 18, 1941. It succeeded the Transportation division established by the Advisory Commission to the Council of National Defense; its responsibility was "to assure maximum utilization of the domestic transportation facilities of the nation for the successful prosecution of the war." Its jurisdiction included railroad, motor, inland waterway, pipe line, air transport and coastwise and intercoastal shipping. The office continued its

activities on a reduced scale into 1946, its best-known activities being the issuance of emergency orders in the case of major dislocations caused by rail and coal strikes.

The War Shipping administration was established in the Office for Emergency Management by executive order of Feb. 7, 1942. A shipbuilding section of the Production division of the Advisory Commission to the Council of National Defense had been established in July, 1940, with the chairman of the maritime commission as its head. During 1941, activities in the field of shipping were handled by the maritime commission, the Office of Production Management, a Shipping Priorities Advisory committee, a Cargo Clearance committee, a Strategic Shipping board, the Economic Defense board and other units. The War Shipping administration was given powers, many of them formerly exercised by the maritime commission, over the operation, purchase, charter, insurance, repair, maintenance and requisition of vessels. All vessels owned by the commission were transferred to War Shipping administration. A later executive order transferred from the coast guard to War Shipping administration certain functions pertaining to the operation of the United States Maritime service, the merchant marine cadet training program, and other nautical training schools. (See also Motor Trans-PORTATION; RAILROADS; SHIPPING, MERCHANT MARINE.)

Manpower, Labour, Selective Service.—The Selective Service system was established under the Selective Training and Service Act of 1940 to administer the selection of men for the armed services under that act, and to perform related duties. It was originally a separate government agency responsible directly to the president, but an executive order of Dec. 5, 1942, placed the organization under the jurisdiction of the War Manpower commission, where it was known as the Bureau of Selective Service. An executive order of Dec. 23, 1943, restored the Selective Service system to its separate status under the president. (See Selective Service, U.S.)

The National Defense Mediation board was established by executive order of March 19, 1941. The board, which was charged with the responsibility of settling controversies between employers and employees, consisted of three public members, four representatives of employees, and four representatives of employees. It was instructed to act when the secretary of labour certified that a dispute threatening the production or transportation of equipment or materials essential to national defense could not be adjusted by the conciliation activities of the department of labour. During its ten months of life, the board received 118 cases, of which 96 had been adjusted when it ceased operation; the remainder were transferred to its successor, the National War Labor board. The board ceased to exist upon the creation of the National War Labor board.

The National War Labor board was established within the Office for Emergency Management on Jan. 12, 1942. The board consisted of four industry, four labour and four public members, assisted by a number of panels that handled much of the work except in the most difficult cases. It was authorized to take jurisdiction of a dispute after a certification by the secretary of labour that the Conciliation service had been unable to settle it. The board might also take jurisdiction of a dispute on its own motion after consultation with the secretary. It was empowered to act as final arbiter of wartime labour disputes and to control adjustments of wages and salaries under \$5,000 a year, with certain exceptions. An executive order of Sept. 19, 1945, transferred the board to the

department of labour to be administered as an organizational entity under the supervision of the secretary of labour. The board was terminated when the National Wage Stabilization board was established as a successor agency.

The National Wage Stabilization board was established within the department of labour by executive order of Dec. 31, 1945. The board contained representatives of employers, employees and the public; it succeeded to certain limited functions of the National War Labor board relating to the settlement of labour disputes. It also succeeded to the powers of that labour board relating to the stabilization of wages and salaries. These functions included acting on applications for approval of increases or decreases in wages and salaries, and carrying out the program for the enforcement of stabilization regulations.⁶

The War Manpower commission was created in the Office for Emergency Management by an executive order of April 18, 1942. The commission, under the chairmanship of the federal security administrator, served at first to provide general co-ordination of manpower matters as a prelude to more extensive operations at a later date. A series of executive orders, the last on Dec. 5, 1942, transformed the commission from a policy-co-ordinating body into an operating agency. These orders gave the War Manpower commission authority over a number of activities, including the National Youth administration, the Apprenticeship Training program, the Training Within Industry service and the Selective Service system. The commission was also given authority to regulate all hiring and recruitment of workers in any area designated as critical by the chairman. The commission was terminated by an executive order of Sept. 19, 1945, and most of its functions were transferred to the department of labour.

The National Roster of Scientific and Specialized Personnel was established on June 28, 1940, by a letter of authorization from the president to the National Resources Planning board. It was administered by the Civil Service commission, under agreement with NRPB, until its transfer to the War Manpower commission by an executive order of April 18, 1942. Later it was transferred to the department of labour, by an executive order of Sept. 19, 1945.

Public Information, Censorship, and Intelligence.—The Office of Censorship was established by an executive order of Dec. 19, 1941, which gave the director of censorship authority "in his absolute discretion" to censor incoming and outgoing communications by mail, cable, radio or other means of communication between the United States and other countries. Internal censorship of domestic press and radio was not subject to the same formal control but was established on a voluntary basis by a letter from the president to the director of censorship on Jan. 27, 1942. The work of the Office of Censorship thus fell into three principal areas: actual censorship of communications between the United States and other countries; the collection, investigation and circulation of information from censored communications that might further the prosecution of the war; and the development and implementation of codes to be followed by the domestic press and radio in their program of voluntary censorship. The office was terminated effective Nov. 15, 1945. (See also Censorship.)

Other agencies handled intelligence, espionage and the

affirmative job of providing information for the public. The principal agency in the information field was the Office of War Information (see below), which carried on after 1942 the work of a number of predecessor agencies, particularly the Office of Government Reports, the Division of Information of the Office for Emergency Management, the Office of Facts and Figures and certain foreign information activities of the Office of the Coordinator of Information. Intelligence and propaganda behind axis lines were initiated by the Office of the Coordinator of Information and later handled by the Office of Strategic Services (see below). Cultural and informational relations with Latin America were handled by the Office of Coordinator of Inter-American Affairs (also see below).

The Office of Government Reports was the oldest of the agencies that were ultimately to form the nucleus of OWI activities. It was created on July 1, 1939, to perform functions formerly carried on by the National Emergency council, which had existed since 1933 and which was abolished by the president's Reorganization Plan II on that date. The office performed a number of functions in the field of public information, including the maintenance of a central press clipping service, public inquiry offices, the coordination of the government's film production program, and the maintenance of facilities (including field offices) for analyzing public opinion, handling federal-state relationships in the public information field and disseminating government information. This agency was transferred to the Office of War Information by the executive order creating that office.

The Division of Information was created in the Office for Emergency Management on March 5, 1941, by instructions given by the president in a letter to the liaison officer for emergency management dated Feb. 28, 1941. It was designed to provide a centralized information service for the emergency agencies as an alternative to separate information offices in each of the agencies. It served most of the existing emergency agencies, assisting materially in such matters as the national drive for production in the first half of 1942 and the preparation of the first general production report issued to the public in July 1942. As information activities grew in size, there was increasing pressure from the war agencies to set up their own information offices, a pattern which was substantially fixed with the establishment of the Office of War Information, to which the Division of Information was transferred.

The Office of the Coordinator of Information was established by presidential order of July 11, 1941, for two purposes: to co-ordinate intelligence materials from all sources, and to transmit information to other countries except to Latin America (covered by the Office of the Coordinator of Inter-American Affairs). The first function was transferred to the Office of Strategic Services by presidential order of June 13, 1942, and the second function was transferred to the Office of War Information by executive order of the same date.

The Office of Facts and Figures was established in the Office for Emergency Management by an executive order of Oct. 24, 1941, to co-ordinate defense information activities on the home front. It was designed to serve as a point of co-ordination for the Division of Information of the Office for Emergency Management and for other government agencies on speeches, press releases, pamphlets, posters and other information media. It served also as a clearinghouse for the activities of the press, radio and motion picture industries in support of the government's war activities. It participated in the work of the Committee on War Information, which was created to act as a war in-

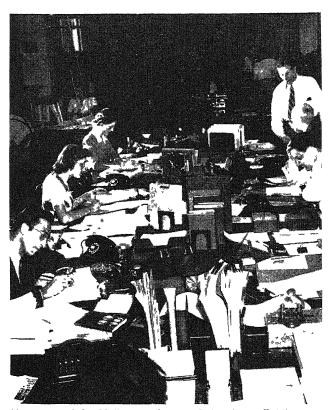

^eThe National Wage Stabilization board was terminated by executive order of Dec. 12, 1946, after most of its powers had been eliminated by executive order on Nov. 9, 1946. Remaining powers were transferred to the departments of labour and treasury.

formation planning agency, composed of representatives of the state, war, navy, treasury and justice departments, the Coordinator of Information, the Coordinator of Inter-American Affairs, the Office of Government Reports, the Office of Lend-Lease Administration, the Office of Civilian Defense, and the Office for Emergency Management. The Office of Facts and Figures was transferred to the Office of War Information by the executive order creating that office.

The Office of Coordinator of Inter-American Affairs was established in the Office for Emergency Management by an executive order of July 30, 1941. This office was a successor to the Office for Coordination of Commercial and Cultural Relations Between the American Republics, which had been established on Aug. 16, 1940, by an order of the Council of National Defense. The functions of this agency went far beyond informational activities; it was established to serve as a centre of co-ordination for cultural and commercial relations with the other American republics. In cooperation with other agencies, particularly with the department of state, it formulated programs dealing with such fields as the arts and sciences, health and sanitation, food supply, education, transportation, press, radio and motion pictures. It assisted in the development of a number of associations and government corporations for activities in special fields, including the Institute of Inter-American Affairs, the Inter-American Educational Foundation, Inc., the Institute of Inter-American Transportation, the Inter-American Navigation corporation and Prencinradio, Inc. The name of the office was changed to the Office of Inter-American Affairs by executive order on March 23, 1945. The informational activities of the office were transferred to the department of state by executive order of Aug. 31, 1945, and the office was terminated, its remaining functions going to the state department.

The Office of War Information was established in the Office for Emergency Management by an executive order of June 13, 1942, to consolidate into one agency the war information activities, both domestic and foreign, of the government. Previously existing agencies that were consolidated into OWI included the Office of Facts and Figures; the Office of Government Reports; the Division of Information of the Office for Emergency Management; and the Foreign Information service, and the outpost, publications, and pictorial branches of the Office of the Coordinator of Information. The office was authorized to carry out, through the use of press, radio, motion pictures and other facilities, informational programs designed to provide an intelligent understanding, at home and abroad, of the status and progress of the government's war activities. It served as a point of co-ordination and clearance for informational activities of other agencies, developed and disseminated information in this country and abroad, and served as a point of contact with many private agencies and associations in their informational activities in furtherance of the war effort. The office was terminated by an executive order of Aug. 31, 1945. The Bureau of Special Services (originally United States Information Service in the Office of Government Reports) handling centralized public inquiry and press clipping services was transferred to the Bureau of the Budget. Foreign informational activities were transferred to the department of state.7

The Office of Strategic Services was created by presidential order of June 13, 1942, to supersede the Office of Coordinator of Information, except for the foreign informational activities of the latter office which were transferred to

News room of the OWI at Washington, D.C., where official reports were received and prepared for release through radio, newspapers, motion pictures and other channels of public information. Both the overseas and domestic branches of the OWI went out of existence in 1945

the Office of War Information on the same date. The Office of Strategic Services was placed under the jurisdiction of the Joint Chiefs of Staff to engage in intelligence operations abroad and in the analysis of strategic information. The office was terminated by an executive order of Sept. 20, 1945, and its remaining functions were transferred to the war and state departments.

Food and Agriculture.- The field of food and agriculture was the principal instance in World War II of an existing agency attempting to administer a major segment of the war economy. Nominally, at least, the department of agriculture had responsibility for the measures developed to prosecute the war in that area: production; allocations to the several major users; distribution; and the administration of loans, "set-asides" and other mechanisms. As in every major segment of the war effort, of course, warious other agencies dealt with parts of the food problem; examples were the Office of Price Administration (food price control and rationing), the War Production board (machinery for food production and processing, among other activities), the Office of Defense Transportation and the War Shipping administration (transportation), and the various agencies concerned with foreign economic problems.

During the existence of the Advisory Commission to the Council of National Defense (May 1940 to May 1941), one of the advisers was responsible for agricultural matters. In May 1941, the president abolished the Agricultural division of the Advisory Commission to the Council of National Defense and transferred its functions to an Office of Agricultural Defense Relations in the immediate office of the secretary of agriculture. Originally designed to have broad functions in connection with food for war, its prin-

The Office of Government Reports was re-established by executive order on Dec. 12, 1946, to carry on the functions of the Division of Special Services of the Bureau of the Budget and the Media Programming division and the Motion Picture division of the Office of War Mobilization and Reconversion.

cipal activities consisted of liaison with the War Production board and the Office of Price Administration on priorities and price problems. On June 4, 1942, a Food Requirements committee was constituted, with the secretary of agriculture as chairman, and membership comprising representatives of the war, navy and state departments, the Office of Price Administration, the Board of Economic Warfare, the Office of Lend-Lease Administration, and the War Production board. The committee was authorized to determine total food needs, the amount required to balance supply and need, and amounts of food to go to the principal claimants, including the army, the navy, other government agencies, foreign nations and civilians. The chairman of the War Production board was authorized to decide issues on which the chairman of the Food Requirements committee and the chairman of the WPB Requirements committee might be in disagreement. The staff of the Office of Agricultural War Relations (thus renamed in May 1942) served as staff for the committee and actual operations were carried on by the committee's constituent agencies rather than by the committee itself.

An executive order of Dec. 5, 1942, made a number of rearrangements in the handling of food problems, largely within the department of agriculture itself. This reorganization was built around four major responsibilities placed on the secretary of agriculture: determination of total food requirements, execution of a food production program to meet these requirements, establishment of allocation and priority controls to bring about proper food distribution, and the procurement of food for the military services and other government agencies. Many existing activities were regrouped under a Food Production ad ministration and a Food Distribution administration

The creation of the Food Production and Distribution administration in 1943 marked a partial step toward setting up an emergency agency to handle food problems. The administration was established within the department of agriculture; the administrator was, however, appointed by the president and was responsible directly to him. All of the powers delegated to the secretary of agriculture in Dec. 1942 were transferred to the administrator. The name of this unit was later changed to War Food administration, and it continued to handle the department's emergency functions until the end of hostilities. It was terminated by an executive order of June 29, 1945.

Civilian Defense, Housing, Health, Welfare and Internal Security.-The Office of Civilian Defense was established in the Office for Emergency Management by an executive order of May 20, 1941. It had been preceded by the Division of State and Local Cooperation in the Advisory Commission to the Council of National Defense, which had concerned itself primarily with federal-statelocal relations in matters of production-contracts, the location of defense plants, and the like. The OCD was directed to assure effective co-ordination of federal relations with state and local governments engaged in the furtherance of war programs, to provide for federal-state-local co-operation in civilian protection, and to facilitate participation of all persons in war programs. Under this authorization, the OCD engaged in a variety of activities related to protection, morale and civilian participation in war activities. The office was terminated on June 30, 1945. (See also AIR RAID DEFENSE.)

In the field of housing, the Advisory Commission to the Council of National Defense announced the appointment of a housing co-ordinator on July 21, 1940, to function, as

did other members of the commission's staff, in a capacity that included co-ordination, investigation and planning rather than direct administration. This office was replaced by the Division of Defense Housing Coordination established in the Office for Emergency Management by an exceutive order of Jan. 11, 1941. The functions of the division, like those of its predecessor, were co-ordinative and advisory. Its functions were transferred to the National Housing agency by the executive order creating that agency. (See Housing.)

The Office of Defense Health and Welfare Services was established in the Office for Emergency Management by an executive order on Sept. 3, 1941. It superseded the Office of the Coordinator of Health, Welfare, and Related Defense Activities set up by order of the Council of National Defense on Nov. 28, 1940. Its responsibility, which paralleled at many places the activities of the Office of Civilian Defense and other agencies, was to co-ordinate health, medicine, welfare, nutrition, recreation and other related activity affecting the national defense. This office was abolished by an executive order of April 29, 1943, and its functions were transferred to the Office of Community War Services, which was established within the Federal Security agency by the same order.

The Committee on Fair Employment Practice was originally established within the Office of Production Management by an executive order of June 25, 1941. This committee was transferred to the War Manpower commission on July 30, 1942. It ceased to exist, and a new committee of the same name was established within the Office for Emergency Management in 1943. Its purpose was to formulate and carry out policies for the prevention of racial discrimination in employment, both in government agencies and in work done under government contract.

The War Relocation authority was established in the Office for Emergency Management by an executive order of 1942, to provide for the supervision and, in a large number of cases, for the maintenance in relocation centres of Japanese from the Pacific coast area. This agency was transferred to the department of the interior by an executive order of Feb. 16, 1944.

Scientific Development.—The Office of Scientific Research and Development was established in the Office for Emergency Management by an executive order of June 28, 1941. It continued and greatly extended the work done by the National Defense Research committee created earlier by order of the Council of National Defense. The office was given a broad charter to co-ordinate and supplement the activities of other government agencies in scientific research, to develop and review plans for scientific research, and to initiate and support scientific research. Armed with the power to make contracts with commercial and university laboratories, the office stimulated and guided important research in a great variety of scientific fields.

Combined Boards.—While not strictly agencies of the United States government, a number of combined boards had an impact on the nation's war effort. The principal boards were the Combined Food board, the Combined Production and Resources board, the Combined Raw Materials board and the Combined Shipping Adjustment board. The first two were established by the president and the prime minister of Great Britain on June 9, 1942, and the last two by the same officials on Jan. 26, 1942. The termination of the first three was announced on Dec. 10, 1945, by the president and the prime minister to take effect June 30, 1946, for the first and Dec. 31, 1945, for the second and third. The Combined Shipping Adjustment board became the United Maritime authority in Aug. 1944,

and extended membership to other maritime countries. (See also British-U.S. War Boards; Canadian-U.S. War Committees.)

There were a number of other international boards and commissions for military or economic purposes on which the United States had membership. Examples were the Joint Economic Committees—United States and Canada, the Combined Chiefs of Staff, and various inter-American defense groups.

Contract Termination and Surplus Property Disposal.—Although World War II left many large and urgent responsibilities, such as housing, veterans' affairs and international problems in its wake, only two postwar problems will be mentioned here. These two, contract termination and the disposal of surplus property, are included because they were handled by agencies of an emergency character and because work on them was begun before the cessation of hostilities.

The Office of Contract Settlement was established by the Contract Settlement Act of 1944, approved July 1, 1944. It was preceded by the Joint Contract Termination board, established on Nov. 12, 1943, by the Director of War Mobilization to develop unified policies governing contract terminations. The office was advised by a Contract Settlement Advisory board consisting of the heads of the departments and agencies most closely concerned with contract termination. By act of congress approved Oct. 3, 1944, the office was placed within the Office of War Mobilization and Reconversion. The function of the office was to prescribe the policies and procedures to govern the termination of war contracts by the various contracting agencies. 8 (See also War Production)

The Surplus War Property administration was established within the Office of War Mobilization by an executive order of Feb. 1944. The administrator, aided by a policy board, was directed by the order to supervise the handling and disposition of surplus war property. General policies and procedures were established by the board; actual disposition was handled by other agencies. This agency was terminated on the establishment of the Surplus Property board.

The Surplus Property board was established by the Surplus Property Act of 1944, approved Oct. 3, 1944. A three-man board replaced the previous administrator, and the act established a number of policies as to preferential treatment of certain groups in the disposal of surplus property. Actual disposal was handled by a number of agencies: department of commerce, Reconstruction Finance corporation, maritime commission, War Food administration, National Housing agency, and others. The board was abolished with the creation of the Surplus Property administration.

The Surplus Property administration was established within the Office of War Mobilization and Reconversion by act of congress approved Sept. 18, 1945. This agency continued to handle policy-making functions; disposal activities were progressively concentrated in the War Assets corporation under the supervision of the Reconstruction Finance corporation. An executive order of Jan. 31, 1946, placed the functions of the Surplus Property administration, along with those of the War Assets corporation under the jurisdiction of the War Assets administration, which was created by the same order. (See also Surplus Property Disposal.)

The War Assets administration was established within the Office for Emergency Management by an executive

order on Jan. 31, 1946, to administer the domestic surplus property disposal functions of the former Surplus Property administration and the War Assets corporation. (The latter had been established in the Reconstruction Finance Corp. in 1943 as the Petroleum Reserves Corp. Its name and functions were changed by amendment of its charter on Nov. 9, 1945, and on Jan. 15, 1946, it was designated by the surplus property administrator as the disposal agency for all kinds of surplus property for which RFC had been the disposal agency.) Thus the War Assets administration became the principal agency, both as to policy formulation and as to actual disposal, for domestic surplus property. (See also Law.)

Great Britain

During World War II there was an unprecedented extension of governmental activity, and every aspect of British national life was touched at one point or another by the state fiat. Assuming responsibility for the whole organization of the war effort, the government directly and indirectly controlled all supplies, productive resources and manpower. To direct labour and productive resources, and to create the machinery required for these purposes, an immense amount of emergency and summary legislation was enacted, mainly in the form of defense regulations. These regulations gave "sub-legislative" powers to ministers of the crown, and they, in turn, delegated their authority to officials of their departments and other appointed representatives or controllers. War agencies in the U.S. sense had no exact parallel in wartime Britain, where executive and regulating powers remained in the hands of government departments acting either directly or through regional or local controllers. Advisory committees and councils were appointed early in World War

"Is There a Screwdriver in the House?" Crawford of the Newark Evening News illustrated the problem of gearing the world's industrial machine to a peacetime economy after the surrender of Japan in Aug. 1945

⁸The Office of Contract Settlement was transferred to the treasury department by executive order on Dec 12, 1946

II to help the government in this work.

In assuming the full direction and regulation of the war effort, both military and industrial, the state took upon itself a large number of new functions, which necessitated the creation of new departments and an extension of the field of action of existing ones.

The most important of the departments whose powers were widened in World War II were the board of trade (control of imports and exports, control and limitation of consumer goods apart from food, and price regulation, the latter being enforced by a central price regulation committee); ministry of labour and national service (formerly the ministry of labour; it had additional responsibilities during the war of administering the National Service acts, of apportioning manpower as between the armed forces, civil defense and industry, and of organizing and controlling the supply of labour for war industries; to give effect to the powers invested in the minister by the Emergency Powers [Defense] act, 1940, a labour supply board with the minister as chairman, was formed in May, 1940); ministry of health (responsible for certain aspects of civil defense, the wartime organization of hospitals, medical treatment of air-raid casualties and the evacuation of the civilian population); and the ministry of agriculture (responsible for home food production and given wide powers of control over agricultural land; it delegated many of its powers to county war agricultural committees).

The new departments or ministries created for war

purposes are given below.

Ministry of Aircraft Production.—A minister for aircraft production was first appointed in May 1940 when, on the resignation of Neville Chamberlain, a new cabinet was formed by Winston Churchill. The whole planning of the aircraft production program was placed in the minister's hands, and he was given very wide powers of control over the aircraft industry. Purchases of aircraft from the United States were also this ministry's responsibility.

Ministry of Civil Aviation.—In April 1940, the undertakings of Imperial Airways and of British Airways were transferred to the British Overseas Airways corporation. This body operated its services as required by the secretary of state for air. In 1944 a ministry of civil aviation was created to take over the air transport undertakings belonging to the B.O.A.C.; it continued to conduct the services for the air ministry.

Ministry of Economic Warfare.—Formed on the outbreak of World War II, its function was the disorganization of the economic life of Germany. It superintended the blockade of Germany, instituted the "navicert" system, made competitive purchases of war materials in neutral countries and negotiated trade agreements. It was abolished in May 1945.

Ministry of Food.—This department, created in 1939, was responsible for the control and distribution of food supplies throughout the war, and it was still carrying out these functions in 1946. It arranged the import and production of food, accumulated reserves, fixed food prices and rationed food to consumers. In Oct. 1939, the ministry set up a system of licensing for the sale of all food, and this control, as well as rationing, first introduced in June 1940, was effected by a network of local food control offices.

The ministry also made provision for the supply of food to bombed areas.

Ministry of Fuel, Light and Power.—This ministry was formed in June 1942 to take over the functions of the

ministry of mines and those of the petroleum department of the board of trade. It was given full control of the coal industry. The minister was assisted by a controller-general and by regional controllers in each district. A national coal board was also appointed by the minister to advise him on all matters affecting the running of the industry. The rationing of fuel was later introduced by this ministry, and it was implemented by its regional and local fuel offices.

Ministry of Home Security.—This ministry was established in 1939 to co-ordinate all civil defense arrangements, which included air-raid precautions and similar emergency services. The post of minister was combined with that of secretary of state for home affairs. During the war the combined ministries, besides being responsible for civil defense (organization of which was placed in the hands of 12 regional commissioners), directed the operation of all security regulations, including the institution of a national registration system, the regulation of aliens, etc.

Ministry of Information.—This was one of the two ministries formed immediately on the outbreak of World War II. Its main functions were the provision of means for the communication of news to the press, censorship, the dissemination of propaganda in axis countries, and publicity in Allied and neutral countries. The department of postal and telegraph censorship of the war office was transferred to this ministry, which was abolished in 1946.

Ministry of Shipping.—The ministry was instituted in Oct. 1939 to assume functions which were previously the responsibility of the board of trade and to co-ordinate the activities of the merchant fleet. It requisitioned all U.K. shipping in Feb. 1940. It was amalgamated with the ministry of transport in May 1941 to form the ministry of war transport. The ministry of transport itself took over the control of the national railway systems and the London Passenger Transport board at the outbreak of war, the minister appointing a railway executive committee which operated the railways on his behalf.

Ministry of Supply.—Formed in July 1939 to acquire and maintain reserves of essential metals and other raw materials in connection with the defense program, the ministry was given wide powers of control over industry during World War II. It regulated the distribution of commodities, fixed commodity prices, placed war contracts and established boards of control over a number of industries. It was assisted by a supply council from Sept. 1939, and it established area committees throughout the country in Dec. 1939.

In May 1940, regulations gave this ministry power to declare all war production undertakings "controlled undertakings," and in June of that year 1,500 firms were subjected to this control.

Such controlled undertakings worked under the directions of a government department, usually the admiralty, the ministry of aircraft production or the ministry of supply.

Ministry of War Production.—All duties previously exercised by the production executive, which was a cabinet committee formed in 1941, except those of manpower, were transferred to this department when it was formed in Feb. 1942. Broadly, its tasks were the supervision and guidance of the various departments concerned with production, the allocation of available services of productive capacity and the settlement of priorities. The ministry was given even wider powers in March 1942. Thereafter it concerted the activities of the production departments, adjusted existing programs and

initiated policy. It was also given control of raw materials and machine tools, and, in co-operation with the ministry of national service, of labour itself. In June 1942, devolution of the ministry's authority was effected by the creation of 11 regional boards of production. A national production advisory council to advise the minister of production on general production questions, excluding those normally handled by the joint organizations of the Trades Union congress and employers, was also formed. In March 1943 the minister conferred on himself powers to appoint three directors to the board of any firm working for the government with government capital. This ministry also made appointments to the combined production and resources board set up in Washington. The ministry was merged in the board of trade in May 1945.

Ministry of Works and Planning.-Founded in Oct. 1940 to erect all works and buildings required by government departments, and to license private building, the ministry also decided as to the priority of air-raid damage proposals. Prior to Feb. 1942 it was known as the ministry of works and buildings; in that month its functions were widened to include those of post-war planning.

War Bonds

On May 1, 1941, the United States government began to raise the huge sums necessary to finance World War II. Between that date and Dec. 31, 1945, the government spent \$350,000,000,000, of which \$318,000,000,000 was for war purposes. It took in \$147,000,000,000 (net) in taxes and other revenues. A net increase in the public debt of \$225,000,000,000 was required to meet the deficit and to build up the cash balance to the level required by the large expenditure volume.

Three principles guided the treasury in borrowing the tremendous sums required to finance the war program. The first was that the funds should be raised in such a way as to minimize the risk of inflation. In order to accomplish this objective it was necessary to sell a large proportion of the total to investors other than banks. In order to do this the treasury initiated a campaign to sell savings bonds to the people as early as May 1941. It initiated a pay roll savings plan for the sale of war bonds to wage and salary earners, and it conducted seven war loans and a Victory Loan sales campaign.

The second principle was that the securities offered should be best suited to the needs of the investors to whom they were sold. In order to do this the treasury sold a wide variety of securities-some short term, some medium and some long. To small investors it sold savings bonds-a security which was made absolutely free from risk of price

fluctuation and was redeemable on demand after a short holding period.

The third principle was that the cost of financing should be kept at a reasonable level. By the war's end the average rate of interest was 1.96%. After World War I—when the public debt had risen to \$24,000,ooo,ooo-the average rate was 4.22% on June 30, 1920.

Of the \$225,000,000,000

"They Put Him Across." Jerry Costello in the Knickerbocker News (Albany, N.Y.), credited the U.S. press for its effective support in government war bond drives during World War II

borrowed to finance the war, the funds raised in the eight drives amounted to \$156,900,000,000. Of this total, \$43,-300,000,000, or 28%, was sold to individuals, partnerships and personal trust accounts. Sales in the First War Loan, which was the smallest, totalled \$12,900,000,000. Sales in the Seventh War Loan, the largest, amounted to \$26,300,-000,000.

Sales of restricted issues, that is, marketable securities not eligible for bank ownership, together with the sales of non-marketable securities (savings bonds and notes) amounted to \$88,700,000,000 or 57% of the total sales. In the Seventh War Loan and in the Victory Loan, the sales of restricted issues and non-marketable securities amounted to 75% and 82% of the respective total sales.

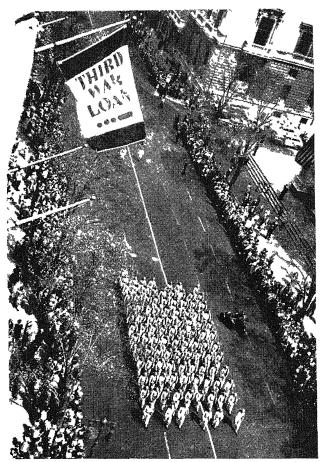

The kinds of securities purchased by the various investor groups in the eight loans combined are shown in the table below.

The Series E savings bond was the security principally relied upon for sale to small investors during the war,

financing period. Nearly \$40,000,000,000 of E bonds were sold. Of this total, more than \$19,900,000,000 were sold in the eight loans. This amount constituted 46% of all securities sold to individuals.

E bond sales were promoted through the pay roll savings plan and other sales devices so that by the end of the war, these bonds had been placed in the hands of some 85,000,000 individuals. Highest sales occurred in the Fourth, Fifth, Sixth and Seventh Loans which took place during the 18 months beginning with Jan. 1944. This was the period when wartime earnings were at their highest levels. In companies and other organizations operating pay roll savings plans, separate pay roll deduction programs were arranged for the periods of the drives, and at the same time campaigns for extra cash sales were promoted. In five loans, pay roll purchases represented the largest proportion of E bond sales; and in the last four loans pay roll sales constituted well above 50% of the total E bond sales.

In the eight loans, 61% of total E bond sales came from 11 states, in each of which sales were more than \$500,000,000. Six of these states—New York, California, Pennsylvania, Illinois, Ohio and Michigan—topped the \$1,000,000,000 mark. Texas, New Jersey, Massachusetts, Iowa and Indiana were included in the \$500,000,000 sales category.

Sales in the eight drives entailed the issuance of more than 450,000,000 separate E bonds. The largest volume sold in a drive, \$4,000,000,000 in the Seventh War Loan, was represented by 92,000,000 units. In the first four war loans, Series E bonds were issued in the following denominations: \$25, \$50, \$100, \$500 and \$1,000. Beginning in the

Fifth War Loan there was offered also a \$10 denomination which was available only to members of the armed forces. In the Victory Loan, the \$200 denomination Roosevelt Memorial bond was introduced.

A total of \$54,700,000,000 of E, F and G savings bonds was sold between May 1, 1941, and Dec. 31, 1945. These sales represented 997,000,000 separate Series E bonds, 4,000,000 Series F bonds and nearly 10,000,000 Series G bonds

By the end of World War II the net result of the U.S. war financing program was that investors generally owned securities adapted to their needs. Savings banks and in surance companies owned principally long-term marketable bonds. Individuals owned mostly nonnegotiable savings bonds, redeemable on demand. Commercial banks owned medium- and short-term securities. Nonfinancial corporations owned mostly short-term securities. The maturity structure of the debt thus obtained was in a position to play its part as an aid to smooth reconversion immediately after the close of the war. (V. L. CK.)

Great Britain.—The policy pursued by Great Britain in financing World War II differed materially from that pur sued during World War I. Instead of covering the deficit through the issue of irredeemable or long-term stocks, the British treasury raised the necessary money through the issue of medium-term bonds. The new method had been inaugurated before the war, through the issue in 1937 of £100,000,000 2½% national defense bonds for the purpose of financing the cost of rearmament. The same method of medium-term financing was pursued throughout the war, and even after the war, and the total of medium-term bonds issued exceeded £7,000,000,000. They carried interest at 21/2% or 3% with the exception of the exchequer bond issue of £326,000,000, issued at 13/4%.

Throughout the war the policy was successfully followed to offer each new issue on terms slightly less favourable to the investor than the preceding one, due allowance being made for their maturity. While during World War I, government borrowing became increasingly dearer to the taxpayer, during World War II it became gradually cheaper. The explanation lay in the application of Lord Keynes's principles of public finance to the financing of war expenditure. Instead of trying to force long-term loans on a reluctant investing public, the deficit was largely financed by an increase in the floating debt bearing interest at $\frac{1}{2}\%$. As the capital available for reinvestment increased, the public was given an opportunity to acquire mediumterm bonds at 21/2% or 3%. This opportunity was eagerly taken, partly because, as a result of the control of private issues, there was no possibility of large-scale reinvestment in any other form, and partly because investors came to realize that the treasury was in a position virtually to determine the rate of interest at which to place its war bonds. This belief in the treasury's omnipotence derived from a growing realization of the possibilities of scientific monetary management.

Even before 1939 the British authorities had been able to keep interest rates steady for many years by means of controlling new capital issues and regulating the volume of bank credit. The prestige they had thus gained during the years 1932–39 was an important factor in helping them to issue war bonds at a low interest rate, notwithstanding the large amount of their financial requirements. Thanks to this policy it was possible to keep down the burden of the increased public debt. Thus the total of the national debt at the end of the financial year 1945–46 had at £24.539,400,000, almost trebled in comparison with the corresponding 1939–40 figure (£8,931,600,000), while the inter-

est charges and management expenses had only doubled at £455,400,000 against £222,800,000; the average percentage of interest on the national debt had dropped from 2.5% (1939–40) to 1.87% (1945–46). But there were dark spots in the picture. The floating debt now represented a large proportion of the total public debt (approximately 27% against 10% before the war) and large amounts of war bonds were maturing during the early reconstruction period. So long as the investors believed in the treasury's ability of keeping down, and even reducing further, interest rates, the renewal of maturing war bonds was not likely to encounter any major difficulties. (See also Banking; Debts, National.) (P. Eg.)

War Crimes

On Jan. 13, 1942, an inter-Allied conference met in London, England, with delegates present from the governments of Belgium, Czechoslovakia, Free France, Greece, Luxembourg, the Netherlands. Norway, Poland and Yugoslavia. Representatives of Great Britain, Australia, Canada, India, New Zealand, the Union of South Africa, the

General view of the International Military tribunal in Tokyo, where 28 Japanese charged with war crimes went to trial on June 13, 1946. The prisoners' dock, under military guard, is at the left United States of America, the Union of Soviet Socialist Republics and China were present as guests. In a joint declaration on the punishment of war crimes the conferees resolved to "place among their principal war aims the punishment, through the channel of organized justice, of those guilty of or responsible for these crimes, whether they have ordered them, perpetrated them, or participated in them."

On Aug. 21, 1942, Pres. F. D. Roosevelt made a declaration on war criminality which concluded with these words: "It seems only fair that they (the war criminals) should have this warning that the time will come when they shall have to stand in the courts of law in the very countries which they are now oppressing and answer for their acts."

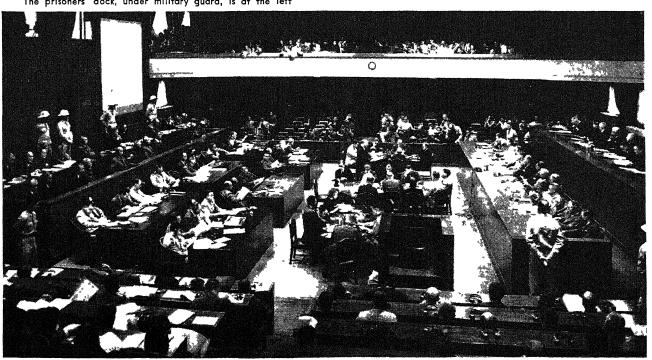

Then on Oct. 7, 1942, Pres. Roosevelt for the United States and Lord Simon, lord chancellor, for the British government in separate declarations announced "the intention to apprehend and punish war criminals, as well as to create an agency to investigate war crimes."

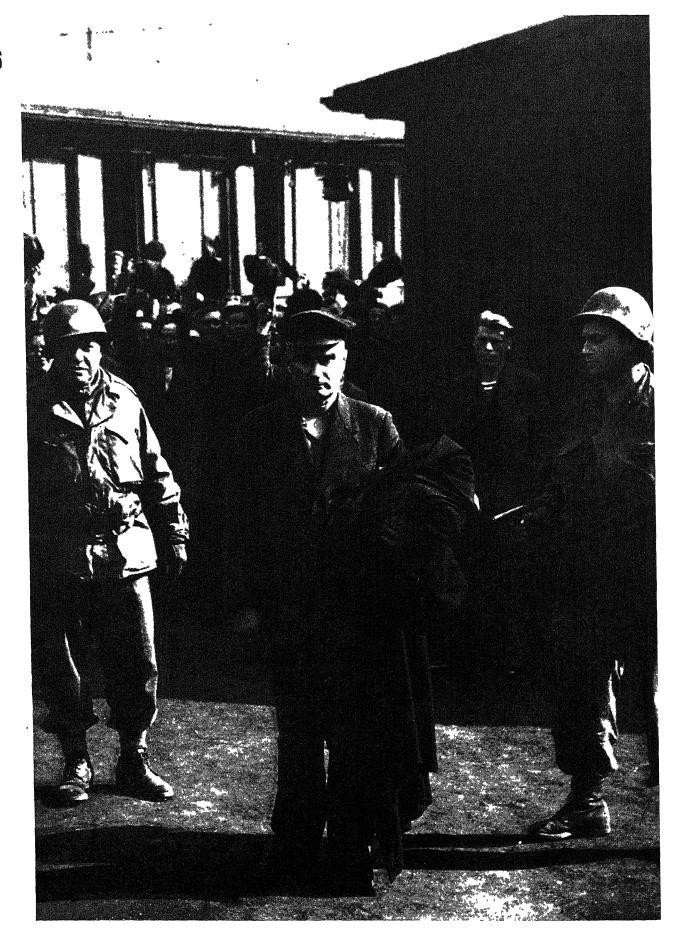

The following year, on Oct. 20, 1943, at a meeting of government representatives at the foreign office in London, the commission was brought into being under the title, United Nations War Crimes commission.

The commission consisted of 16 members—the representatives of the governments of Australia, Belgium, Canada, China, Czechoslovakia, France, Greece, India, Luxembourg, the Netherlands, New Zealand, Norway, Poland, the United Kingdom, the United States of America and Yugoslavia. These representatives were all distinguished diplomatists and lawyers.

Sir Cecil Hurst, United Kingdom representative and vice-president of the Permanent Court of International Justice, was the first chairman of the commission. He resigned on account of ill health and was succeeded on Jan. 31, 1945, by Lord Wright, lord of appeal in ordinary, representing Australia on the commission.

Duties of the Commission.—The commission was created

as a fact-finding body, but was later also given advisory functions. It soon became apparent that the commission could not itself investigate the mass of charges and reports of war crimes. Shortly after its formation the commission, therefore, urgently recommended to each of the member nations that it establish a national war crimes office to investigate war crimes against the citizens of its own country. Each established a war crimes office to detect, investigate and record evidence of war crimes. When a national office determined that a case was reasonably complete, it forwarded a summary to the United Nations War Crimes commission or its subcommission in the far east, which examined the information and materials.

These bodies, if they believed that a war crime had been committed and that the information showed that there was, or would be at the time of trial, sufficient evidence to justify a prosecution, placed the name or description of the individual upon their lists. The actual investigation, including the detection of crime, interviewing of witnesses, and preparation of cases, was done by the official agencies best suited to conduct investigations within the national boundaries and according to the laws of each country.

After official lists of war criminals had been prepared by the commission, they were furnished to the apprehending authorities in order that the persons named might be arrested and turned over to the proper nation for trial.

The commission had three principal standing committees: the Committee on Facts and Evidence, the Committee on Enforcement and the Committee on Legal Questions.

The Subcommission for the Far East was created in May 1944 with its location originally at Chungking. This subcommission was composed of representatives of Australia, Belgium, China, Czechoslovakia, France, India, Luxembourg, the Netherlands, Poland, the United Kingdom and the United States. Its function was to examine information against Japanese war criminals, and to prepare lists for forwarding to all participating nations. However, the main commission in London was not precluded from receiving evidence of war crimes in the far east, and considered a number of charges against Japanese.

The soviet union was not a member of the United Nations War Crimes commission but had a commission of its own—the Russian Extraordinary State commission.

After the formation of the United Nations War Crimes commission the United States had a full-time commissioner and, for most of the time, a deputy commissioner, and maintained offices and staff in London. The U.S. commissioner not only performed his duties upon instruction of the state department, but also maintained close liaison with both the war crimes organizations in the field and with the war crimes office in the civil affairs division of the war department, which furnished trained officers to represent the United States on the commission.

Herbert C. Pell, formerly U.S. minister to Portugal and Hungary and former member of congress, was the first commissioner to represent the United States. He was succeeded on May 10, 1945, by Colonel Joseph V. Hodgson, who had served both as deputy and acting commissioner since Jan. 1, 1945. Lieutenant Earl W. Kintner, then deputy commissioner, served as acting commissioner after the resignation of Colonel Hodgson on May 17, 1946. Colonel Robert M. Springer was appointed commissioner by President Harry S. Truman on July 18, 1946. (R. P. P.)

Nazi commander of the concentration camp at Altendorn, Germany, being taken into custody by U.S. military police in 1945, as former inmates cheered in the background. On April 1, 1946, there were 13,582 Germans on the U.N. list of war criminals The Nuernberg Trial.—When the Nuernberg trial was opened on Nov. 20, 1945, Lord Justice Lawrence, the president, described it as "unique in the history of the jurisprudence of the world and of supreme importance to millions of people all over the globe."

Originally 24 defendants were indicted. Martin Bormann was tried and sentenced to death in his absence. It was not known whether he was a fugitive or dead. On Oct. 25, 1945, Robert Ley committed suicide in Nuernberg jail, in a cell adjacent to that in which, a year later, Hermann Goering anticipated the gallows. On Nov. 15, 1945, the tribunal decided that the aged Gustav Krupp von Bohlen und Halbach could not then be tried because of his physical and mental condition. Without Krupp, the list of defendants lost its representative character as a crosssection of nazi power. By Nov. 15, however, public impatience at the delay was so great that further postponement was considered inadvisable, though the decision to continue without an industrialist in the dock was by no means unanimous. The proceedings in the closed sessions, both of the judges and of the prosecutors, were necessarily secret. Differences between representatives of four differing legal systems and procedures, with conflicting political attitudes and speaking different languages, were inevitable. One of the outstanding achievements of the trial was the extent to which those differences were bridged, both on the bench and at the prosecution tables. Until the very last day, when the dissenting opinion of the Russian judge was published, the United Nations at Nuernberg remained united. It should be noted, however, that this dissenting soviet opinion embodied many of the submissions made by each of the Allied prosecutors. They had called unanimously for the conviction not only of the three defendants-Hjalmar Schacht, Franz von Papen and Hans Fritzschewho were acquitted by a majority vote of the tribunal, but also for the condemnation of the Sturm-Abteilungen (the S.A.), the high command and general staff and the reich cabinet, which again the majority of the tribunal declined to declare criminal groups or organizations. Although there were differences between the judges as to the form of punishment of some of the convicted defendants, there was no recorded conflict as to the fact of their guilt or as to a finding of criminality against the leadership corps of the nazi party, the Schutz-Staffeln (the S.S.) (including the Sicherheits-Dienst (the S.D.) and the Geheime Staats-Polizei (the

When the hearing of evidence and the speeches of counsel ended on Aug. 31, 1946, more than 400 open sessions of the tribunal had been held. Thirty-three witnesses gave evidence orally for the prosecution, among them German generals (even a field marshal), S.S. chiefs, survivors of concentration camps and those who had commanded them. Sixty-one internees, in addition to 19 of the defendants themselves, spoke for the defense; a further 143 gave evidence for the defense by means of written answers to interrogation.

There was the mountain of evidence relating to the indicted organizations, given by more than 100 witnesses and about 200,000 affidavits. Thousands of documents were submitted by each side. The prosecution case was largely founded on the researches of Allied investigators who, in the wake of the Allied armies, unearthed in salt mines, in holes in the ground, in secret places behind false walls, in hastily abandoned headquarters, most of the secrets of the third reich. It was their own documents, not the eloquence of Allied counsel or the accusations of their victims, that

the whole atmosphere of the the war criminals at Nuernberg, Germany, took the stand in his own defense in March 1946, pleading not guilty

condemned the nazi chiefs; the whole atmosphere of the trial was one of fact-finding.

Such was the nature of the court's proceedings that there was unqualified acceptance of the court's authority by the accused and their counsel. "I am firm in the conviction that truth and justice will prevail before this tribunal," said Baron Konstantin von Neurath in his final plea. On Oct. 1, 1946, when the tribunal sentenced 12 of the accused to death (Hermann Wilhelm Goering, Joachim von Ribbentrop, Wilhelm Keitel, Ernst Kaltenbrunner, Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Fritz Sauckel, Alfred Jodl, Arthur Seyss-Inquart and Martin Bormann), not one of them protested or challenged the tribunal's authority. Before them, for ten months, history had been patiently unfolded. Their contribution to it was shown to be, first, aggressive, premeditated war against 12 nations-in Europe more than 10,000,000 soldiers, sailors, airmen and civilians killed in battle; townships wrecked from London to Stalingrad, the countryside devastated and the aftermath of war in disease and hunger felt through most of the world. Second, genocide, the deliberate nazi attempt to destroy whole nations and races. Third, mass murder: not less than 12,000,000 men, women and children exterminated scientifically; two-thirds of the Jewish race in Europe dead; most of these 12,000,000 gassed and burned in the ovens of Oswiecim (Auschwitz) and Treblinka, Dachau, Buchenwald, Matthausen, Majdanek and Marienburg, and the rest butchered in mass graves all over Europe. Fourth, 7,000,000 men, women and children taken into slavery. Finally, the moral perversion of the German people by the nazis; of their corruption into naziism, the defendant Baldur von Schirach, leader of the Hitler Youth, confessed, "It is my fault that I educated German youth for a man who committed murders millionfold."

The legal bases of the trial were the cause of much controversy. The conflicting contentions were argued by the prosecutors and by the most eminent of German counsel at the trial itself. Most of the commentators singled out as the major legal achievement of the trial the vindication of what the British chief prosecutor, Sir Hartley Shawcross, described as "the salutory legal rule that persons who, in violation of the law, plunge their own and other countries into aggressive war, do so with a halter round their necks." In the final result, however, each of the 12 defendants who was sentenced to death was found guilty of committing war crimes and (or) crimes against humanity. No one was hanged for waging aggressive war alone. Rudolf Hess, although convicted under counts one and two of the indictment of planning and waging aggressive wars, was not sentenced to death.

Many, alarmed by the persistence of persecution on political, racial and religious grounds in the postwar world, were disappointed with the tribunal's limitation of the legal conception of "crimes against humanity" under the

charter, to crimes against humanity which were committed in execution of or in connection with aggressive war or war crimes. Nuernberg, however, was the beginning, not the end, of the effort described by Justice Jackson, the U.S. chief prosecutor, in his opening speech: "to put the forces of international law, its prospects, its prohibitions and, most of all, its sanctions, on the side of peace, so that men and women of good will, in all countries, may have 'leave to live by no man's leave,' underneath the law." War Production

The tremendous volume of war equipment produced by the United States was a major factor in the victory of the United Nations in World War II. The world's battle-fronts were not only amply supplied with munitions, but the basic economy was maintained in a healthy condition, capable of sustained support of the war effort, and the total national production of goods and services rose to the highest level in the nation's history.

The U.S. Production Record.-Although the U.S. was not a belligerent until the Japanese attack on Pearl Harbor on Dec. 7, 1941, the initiation of the rearmament program dated from mid-1940, and followed closely on the German invasion of the Low Countries and France. From July 1, 1940, to July 31, 1945, just two weeks before the formal capitulation of Japan, the U.S. produced \$181,000,-000,000 worth of munitions. Of this total, aircraft constituted 24%; ships, 22%; clothing equipage, medical supplies and other miscellaneous equipment and supplies, 20%; combat and motor vehicles, including tanks and trucks, 12%; ammunition, 10%; guns and fire control equipment, 6%; and communications and electronic equipment including radio and radar, 6%. The year-by-year rise in munitions production (measured in dollar terms on the basis of 1945 unit costs) was as follows:

July 1, 1940—Dec. 31, 1941	\$10,489,000,000
1942	30,168,000,000
1943	51,745,000,000
1944	57,594,000,000
Jan. 1—July 31, 1945	30,767,000,000

Measured by units or by weight, rather than by dollar value, the five year production achievement was even more remarkable. More than 296,000 military aeroplanes and

special purpose aircraft were produced. About 97,000 were bombers, 99,000 fighters and 24,000 transports, the rest being trainer, communication and reconnaissance planes and special purpose aircraft. Naval construction amounted to 71,000 ships weighing 8,200,000 displacement tons. The great number of these were landing vessels, which also accounted for 35% of the total tonnage. Combatant vessels, though only 1,200 in number, accounted for 43% of the total tonnage. The maritime commission built 4,800 merchant ships weighing 50,400,000 deadweight tons. The bulk of the merchant vessels, more than 65%, were emergency cargo vessels specially designed for wartime mass production even at the expense of speed of movement in the water.

Other achievements included the production of 86,000 tanks, 2,500,000 trucks, 41,600,000,000 rounds of small arms ammunition, 4,200,000 short tons of ground artillery ammunition and 5,800,000 short tons of aircraft bombs.

The significance of U.S. production of munitions could best be appraised against the munitions production of other nations. In 1944, the peak year, the U.S. produced 43% of the world's \$100,000,000,000 output of combat munitions. This was more than the rest of the United Nations combined; it was also more than the axis nations combined. It was estimated that the other United Nations produced almost a third, and the axis a little more than a quarter, of the world's munitions in 1944.

While exact international comparisons were not feasible, a rough comparison could be made of munitions production in the U.S. and the United Kingdom. Table I shows U.S. production of particular types of munitions in the period of July 1, 1940, to July 31, 1945, covering 61 months, and United Kingdom production of the same types of munitions in the period of Sept. 1939 to June 1944, covering 57 months. British production and that of other principal belligerents are discussed separately later.

Table I.—Production of Selected Munitions in the United States and the United Kingdom (U.S. figures: 61 months, July 1, 1940, to July 31, 1945. U.K. figures 57 months, Sept. 1939 to June 1944)

		7
Munitions Item	United States	United Kingdom
Aircraft		
Total: Number	296,000	102,600

U.K.: Statistics Relating to the War Effort of the United Kingdom, Nov. 1944 (London: H.M. Stationery Office, Cmd. 6564), pp. 10–14.

The war production of the U.S. was accomplished primarily through pressing total national production to hitherto undreamed of heights, rather than by rigorous reduction of civilian living standards. Between 1939 and 1944, the total value of national output of goods and services rose from \$88,600,000,000 to \$198,700,000,000, a 125% increase. Inflationary influences were reflected in these figures, however. If the figures were adjusted to reflect 1939 dollar values throughout the period and thus more accurately to reflect actual production, the rise was from \$88,600,000,000 to \$135,000,000,000,000, a 52% increase. Of the

total output in 1944, 40% was for war purposes, and 60% for nonwar purposes. Despite the absorption of so large a segment of national resources for war purposes, consumer purchases of goods and services were actually greater in 1944 than in 1939, but slightly less than in 1941. Though there were shortages of particular kinds of consumer items, and deterioration of the quality of goods and services, the civilian in the U.S. fared remarkably well. In contrast, the quantity of consumer goods and services purchased in the United Kingdom fell by 21% between 1938 and 1944.

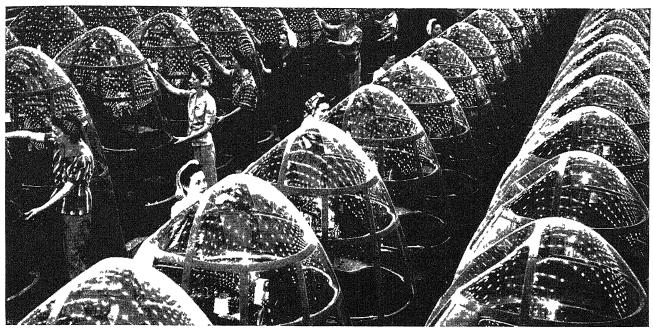

The wartime emphasis on manufacturing, mining and construction meant that there were unusually great increases in these types of output. In fact, taking these activities as a single group, there was a doubling of output between 1939 and 1944. The average annual increase of this combined industrial production was more than 15%, compared with a 4% average for the 70 years from 1869-1939, and a 7% average for the 1914-18 period of World War I. The most nearly comparable increase was the 12% annual average achieved in the 1932-37 recovery from the depression of the early 1930s. Manufacturing itself (as distinct from mining and construction) trebled in output between 1939 and 1944. Production of raw materials rose in the same period by 60%. New construction doubled between 1939 and 1942, after which it fell back until in 1944 it was a third less than in 1939, reflecting the completion of war plants and the diversion of resources to use in manufacturing.

The U.S. munitions production program required conversion of many factories producing peacetime goods, construction of new plants and expansion of old ones, manufacture and installation of large numbers of machine tools, more intensive use of available plants and tools, accelerated production and importation of materials, enlargement of the total labour force of the country and raising of the productivity of the individual worker.

Conversion of plants was particularly important in the metal-working industries. In late 1944, almost three-fourths of the output of prewar metal-working plants consisted of military supplies. Almost a third of their output consisted of combat matériel, as distinct from products similar to those manufactured in peacetime. Certain industries upon which consumers in peacetime had made heavy demands shifted over to military supply to the almost complete exclusion of civilian requirements. In the last quarter of 1944, the motor vehicle and parts industry shipped 86% of its output as military supplies. The radio, radio tube and phonograph industry shipped 94% for the same purpose, while the comparable percentage for the communication equipment industry was 88%, and that for the refrigerator and refrigeration machinery industry was 79%.

The construction and equipment of new plants and the expansion of old plants were a major phase of the war program, especially from 1940–43. The manufacturing capacity of the country increased by about 50% between 1939 and 1945, at a cost of \$25,000,000,000, most of it borne by the government. In terms of cost, the most substantial additions were those for aircraft, explosives and ammunition loading, ship construction and repair, guns and ammunition and iron and steel. Though smaller in amount, the expansions for other materials and products, notably synthetic rubber, aviation gasoline, aluminum and magnesium, were crucial to the success of the war program.

World War II resulted in no general shift in the geographical distribution of U.S. industry as a whole. Up to mid-1944, the major wartime facilities expansions were in Pennsylvania, Ohio, Michigan, Illinois, Wisconsin, New

Women aircraft workers finishing transparent bomber noses for fighter and reconnaissance planes at the Douglas Aircraft Co. plant in Long Beach, Calif., in 1942

York, California, Texas and Indiana. Each of these states added more than \$1,000,000,000 worth of wartime facilities between July 1940 and May 1944, representing in each case more than 5% of the nation's total facilities expansion in this period. Most of such slightly industrialized states and local areas as did experience marked expansion of industrial capacity during the war owed the expansion primarily to such industries as aircraft and shipbuilding, which were not likely to have a postwar market comparable to that of wartime. In each of several states, such as Utah and Nevada, the great proportionate expansion of industrial capacity largely resulted from the construction of a single large plant, whose postwar utility was doubtful.

An important aspect of plant construction and of conversion of old plants was the provision of new machine tools adapted to the specialized needs of military production. The number of machine tools in the hands of U.S. manufacturers increased about 50% between the end of 1939 and the end of 1944. In the peak year, 1942, four times as many machine tools were shipped to U.S. factories as in 1940. These were notable achievements in the face of the fact that machine tools had been a major bottleneck in the defense period's rearmament program.

Maximum utilization of plants was another objective of the war supply program. While in 1939 factories probably were used not more than 40 hr. a week, by Dec. 1942 the plants in the war industries were averaging almost 90 hr. a week, and a number of the plants in the aviation program were averaging well above 100 hr. a week. The peak of plant utilization was reached in the spring of 1943, when 39% of the workers in metals-using industries were employed on the second and third shifts. It was estimated that this increased utilization of existing facilities added almost as much to industrial output as did the construction of new facilities.

The production of industrial raw materials, as noted above, rose by 60% between 1939 and 1944. Production of steel, basic to all major munitions as well as to many industrial equipment and civilian items, doubled in this period. Industrial chemicals production trebled. The year

1943 marked peak production for a number of key materials, among them aluminum, which was 5 times its 1939 production; magnesium, which was 55 times 1939 output; copper, whose smelting in 1943 was 40% above the rate of 1939.

The U.S. was almost wholly dependent on foreign countries for 48 of the 136 raw materials listed as strategic and critical at the beginning of the war. Examples were tin ore, natural rubber, chrome, manganese, nickel, tantalite, and burlap and rope fibres. In addition, foreign sources were called on to supplement the domestic production of such materials as copper, lead and bauxite.

The total labour force of the country was markedly expanded during the war. It rose from 54,000,000 to 64,000,000 persons between 1939 and 1944. The number of actually employed persons rose even more, for the unemployed in the total labour force fell from 9,500,000 in 1939 to 840,000 in 1944. Of the 18,700,000 persons thus actually at work in 1944 who in 1939 had been either unemployed workers or persons not connected with the labour force, the armed forces took 11,000,000, leaving 7,700,000 as net additions to the civilian working force. More than 6,500,000 workers moved into the manufacturing, mining and construction industries between 1939 and 1943, the peak year for this type of employment.

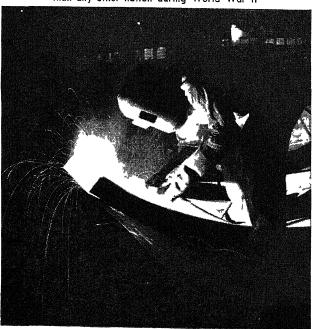

The vast expansion of the U.S. industrial output depended in part on the increased productivity of the individual worker. One way of achieving this was through lengthening the work week. In 1944, the average work week in manufacturing was more than 45 hr., a 20% increase over the 38 hr. worked in 1939. In durable goods production, especially vital to the munitions program, there was a 25% increase in the work week, from 38 hr. in 1939 to 47 hr. in 1944. Other factors in increased productivity were increased worker efficiency, provision of upto-date plant equipment, labour-management committees sponsored by the war production drive, intercompany pooling of information on efficient production techniques, application of mass production methods to products not previously manufactured by such methods, greater use of large plants and, of course, the patriotic incentives of wartime. Whatever the factors, it was estimated that the pro-

ductivity of labour increased by about 25% between 1939 and 1944.

"Defense" Period, 1940-41.-Between May 1940 and Dec. 1941, the U.S., though not a belligerent, was actively aiding the enemies of the axis and laying the foundations for the mammoth war production achievements of 1942-45. Conditioning the defense period mobilization activities were a number of factors, among them the following: The strongly noninterventionist and pacifistic sentiment of a large portion of the people, reflected in divisions of opinion within congress; the reluctance of some business men and defense officials to see "business as usual" disturbed by drastic orders of a regimenting character, particularly in view of prophecies of an early collapse of Great Britain and expectations in many quarters that the U.S. itself would not be attacked or become a belligerent; the consistently low military requirements stated as adequate by the military agencies, a result in part of the difficulty of defining when, where, for how long, and against what enemies the U.S. might have to fight; the mutual distrust between the Roosevelt administration and the business community that was part of the legacy of the New Deal, and the resulting jockeying between the president and the more conservative businessmen for control of the industrial mobilization program; and the presidential election of 1940, which precluded the establishment in mid-1940 of a strong industrial mobilization agency that might be misconstrued as a certain portent of the nation's entry into the war. Perhaps most important among these factors was the simple question of whether the U.S. would ever be a belligerent. Nobody could answer the question with certainty. Yet the doubt on the question beclouded the solution of many problems that under conditions of actual war were found to be very simple.

During the defense period, the federal government was poorly organized for the task of economic mobilization. The Army and Navy Munitions board had developed an "Industrial Mobilization Plan," which contemplated estab-

Welder at the Federal Shipbuilding and Dry Dock Co. at Kearny, N.J., in 1943. U.S. shipyards contributed more to Allied tonnage than any other nation during World War II

lishment of a War Resources administration to serve as the key superagency for wartime industrial co-ordination. This administration was to be set up in skeleton form as early as practicable when an emergency was envisioned. Shortly before the German invasion of Poland on Sept. 1. 1939, the assistant secretaries of war and navy, with Pres. Roosevelt's approval, called into being a War Resources board, headed by E. R. Stettinius, Jr., and principally composed of business leaders. It was expected that this board would oversee such industrial mobilization steps as might be appropriate, serving in effect as a skeletal War Resources administration. However, in November, when the formal state of war between Germany and France and England had settled down to a winter "Sitzkrieg," the president dismissed the War Resources board, which had been widely attacked for its lack of representation of labour and small business.

Meanwhile, on Sept. 8, 1939, Pres. Roosevelt had made provision, with congressional acquiescence, for an Office for Emergency Management as an integral part of the executive office of the president. On May 25, 1940, after German invasion of Denmark, Norway, Belgium, the Netherlands and France, the president activated the Office for Emergency Management, which provided the legal peg on which he could hang most of the agencies created in the defense period. On May 28, 1940, relying on a long dormant statute of Aug. 29, 1916, the president announced revival of the Advisory Commission to the Council of National Defense. The council itself, composed of six cabinet officers, played no more than a nominal role, but the Advisory Commission initiated the economic mobilization of the country and continued in operation until Oct. 1941. Its significant work, however, was confined to the last seven months of 1940.

The Advisory Commission was composed of seven advisers, each responsible directly to the president. The commission had no chairman. The advisers were: E. R. Stettinius, Jr., on industrial materials; William S. Knudsen, on industrial production; Sidney Hillman, on employment; Chester C. Davis, on farm products; Ralph Budd, on transportation; Leon Henderson, on price stabilization; and Harriet Elliott, on consumer protection. Donald M. Nelson, appointed coordinator of national defense purchases in June, served in effect, though unofficially, as an eighth member of the commission.

The commission as a group reviewed proposals of the war and navy departments for construction of defense plants, prescribed general policies to govern the award of defense contracts, initiated legislation to encourage construction of defense plants with private capital, stimulated the participation of small business in defense work, recommended purchases of strategic materials for stockpiling and was responsible for the establishment of a priorities board, which instituted a voluntary preference rating system. Individual members of the commission were active as advisers and co-ordinators in their respective fields.

On Jan. 7, 1941, the president established the Office of Production Management (OPM), which promptly took over the Advisory Commission's work on industrial materials, industrial production, purchases, employment and priorities. The immediate management of OPM was assigned jointly to a director general and an associate director general, posts held respectively by William S. Knudsen of the General Motors corporation and Sidney Hillman of the Amalgamated Clothing Workers of America. This socalled partnership reflected the president's belief in balancing management and labour interests in the direction of industrial mobilization. It also testified to the vital con-

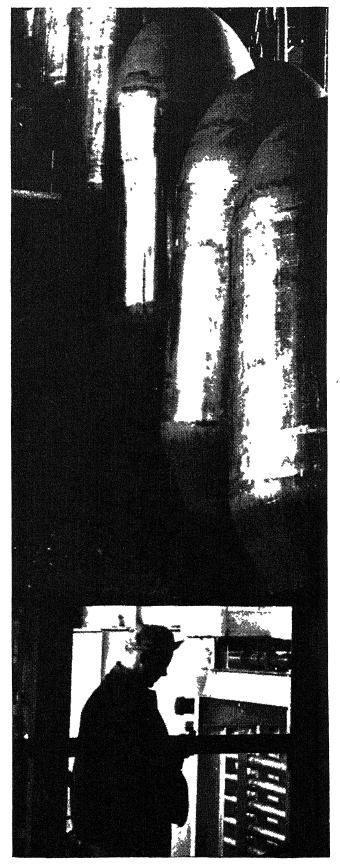

tribution of immigrants to U.S. leadership, for Knudsen had been born in Denmark, and Hillman in Lithuania. Over-all control of OPM policy was the task of a council composed of the director general and associate director general of OPM, the secretary of war and the secretary of the navy.

The OPM was reorganized in June and Aug. 1941. The June reorganization set up commodity sections, each designed to focus responsibility within OPM for control of an individual commodity or group of commodities and for contacts with the corresponding industries; it also established industry advisory committees, enabling formal consultation by OPM with industries affected by existing and proposed orders, but at the same time rejecting proposals that industrial self-regulation, rather than government directive, be the basic technique of gearing individual industries to defense production.

The August reorganization was designed to (1) provide a new policy-level board above OPM, which would take a broader view than OPM of the programming of defense requirements and press more vigorously for curtailment of less essential civilian production; (2) settle the long-disputed question of whether OPM or the Office of Price Administration and Civilian Supply should control civilian allocation and curtailment; (3) provide an escape from the morass into which priorities administration had fallen; and (4) give added impetus to the policy of bringing small business into the defense mobilization program. The president created a Supply Priorities and Allocations board, with broad policy control over programming of requirements, over priorities and allocations problems and over materials supply problems. Vice-president Henry A. Wallace, who was chairman of the Economic Defense board, was made chairman of the new board, which included the four members of the OPM council, and Leon Henderson, price administrator, and Harry Hopkins, special assistant to the president in charge of the lend-lease program. Donald M. Nelson was appointed executive director of the board. Nelson also succeeded Stettinius as OPM director of priorities, and in that role set about to effect much-needed improvements in priorities administration. To settle the summer-long controversy over civilian allocations authority, the president established in OPM a Division of Civilian Supply, headed by Leon Henderson, and transferred to it the civilian supply function previously assumed by the Office of Price Administration and Civilian Supply. The president also established in OPM a Division of Contract Distribution, designed to stimulate the award of contracts and subcontracts to small plants. Several additional changes were made in the organization and directorship of OPM divisions.

The major achievements of the defense production agencies were less in the field of munitions production than in the completion of much of the foundation for the munitions production of later years. The munitions produced in the 18 months of July 1940 to Dec. 1941, were but 12% of the production attained in the last 18 months of the war. Illustrative of the scale of defense period production of particular munitions items were the 23,000 aeroplanes produced, compared to 140,000 in a like period in 1944–45; the 136 merchant ships built, compared to almost 2,000 in the later period; and the 4,200 tanks produced, compared to 18,700 in the later period.

However, the value of manufacturing facilities put in place in the 18 month defense period amounted to \$5,800,000,000, well ahead of the \$4,700,000,000 worth of manufacturing facilities put in place in the war's final 18 months. Similarly, much progress was shown in machine tools alone.

Mass production of 500-lb. bombs at the A. O. Smith Corp. plant, Milwaukee, Wis. This type of bomb was used in the air war over Europe prior to the Allied invasion of the continent in 1944

The 1941 domestic shipments of 132,000 machine tools, though less than 1942 and 1943 shipments, compared favourably with the 100,000 shipped in 1944. Raw materials production was substantially accelerated in 1940 and 1941. In 1941 the U.S. produced about 170% as much steel as in 1939, 120% as much copper, 160% as much zinc, 190% as much aluminum and 490% as much magnesium.

Industrial mobilization in the defense period encountered several major problems. One was that of relations between the civilian production agencies and the armed services. The failure of the president to put the Industrial Mobilization Plan into effect, the weak and largely advisory character of the succession of civilian mobilization agencies, the direct administration of contract awards and priorities for military items by the war and navy departments, and the services' natural reluctance to yield authority until they had more confidence in the civilian agencies—all played their part in making the problem acute.

A second problem was that of fixing upon the goals of the production program. The Industrial Mobilization plan had contemplated that 1,000,000 men would be needed for a protective mobilization force, and 4,000,000 men, if necessary, for full mobilization. On the basis of these goals, the Army and Navy Munitions board had concluded that no expansion of metal-producing capacity would be necessary to meet war needs for copper and aluminum, although well before Pearl Harbor the civilian agencies found it necessary to initiate important expansion programs for both metals. Even the Industrial Mobilization Plan goals, low as they were later found to be, were reduced in 1940, and a 1,200,000 man army was taken as the group to be fully equipped, and a 2,000,000 man army as the group for which combat items of equipment should be planned.

The strictly logical civilian agency officials argued that the armed services should be relied on for statements of military requirements, and the civilian agencies should then see that production met these requirements. Another group, however, persistently contended that military estimates of needs were far too low, and pressed for production policies geared to an independently determined set of high munitions production goals. Had the goals fixed by the military been followed, the expansion of industrial facilities, production of raw materials, stockpiling of strategic materials, curtailment of civilian consumption and related measures, would have been woefully inadequate for the emergency confronting the nation after Pearl Harbor. The need for civilian officials' improvising of production goals, coupled with the reappraisals of requirements by the military agencies, the dependence of procurement operations upon the fitful succession of appropriation acts and the appeals by Great Britain and other countries for additional war equipment, meant that there was a highly unstable basis for the planning of facilities and materials supply programs.

A third problem involved expansion of materials-producing capacity. There was a dramatic dispute over the steel industry's assurance that it had adequate capacity to meet any foreseeable demands of the defense program. The industry's position was supported by Gano Dunn, a presidential consultant, in Feb. 1941, but he reversed himself in May, with the result that an expansion program for the steel industry was inaugurated late in 1941. The steel dispute was repeated, though in more muted tones, for other commodities. In almost every case, the factors included the industry's fear of over-expansion of capacity

in relation to peacetime markets, an ill-defined and low set of estimates of military requirements and a confidence that increased military needs could be met out of the "cushion" of civilian consumption.

Finally, there was contention over the curtailment of production of civilian goods. The curtailment dispute centred about industries normally producing such items as automobiles, refrigerators, radios and farm machinery. The curtailment proposal had several objectives: to free factory space and machine tools for use in munitions production; to divert steel, copper, aluminum, nickel and other critical metals from civilian use to use in munitions; and to bring able managers and skilled workmen into the munitions program. There were doubts among industrialists and OPM executives about the adaptability of the machine tools in civilian plants to specialized munitions production, and doubts about the wisdom of reducing civilian production until there could be a heavier load of military contracts to take up the production slack promptly. Labour was also concerned about the weeks-long unemployment that workers in converting industries would suffer. Until after Pearl Harbor, these objections to curtailment for facilities-conversion reasons seemed persuasive to OPM officials. However, curtailment was initiated for another reason, the growing shortage of critical metals. An agreement in May 1941 between OPM and the automobile industry to effect a 20% voluntary curtailment of automobile production was followed by mandatory OPM orders in Sept., effecting a 43% curtailment. Similarly, mechanical refrigerator production was cut 43%.

During 1941 a number of other OPM orders were issued, designed not to reduce the output of civilian end-products, but to prohibit or reduce the use of critical materials and equipment in nondefense work. Even before July 1941, such items as machine tools, aluminum, magnesium, tungsten, nickel, copper, natural and synthetic rubber and zinc were under priorities and allocations controls, and other items were added during the rest of the year.

Wartime Organization.—Pearl Harbor ended all doubts about the involvement of the U.S. in war and forced adoption of challengingly high production goals and establishment of a new agency to gear American industry to the new task.

On Jan. 16, 1942, when the U.S. had been an active belligerent for a little more than a month, the president established the War Production board. Despite its title, WPB was a single-headed agency. Its chairman had full power of decision, and the members of the board served in a merely advisory capacity. The president appointed Donald M. Nelson, former vice-president of Sears Roebuck and company, as chairman of the board. Nelson's broad social philosophy, his understanding of the political and economic factors of the modern industrial economy and his inclination toward negotiation as a technique of reaching solutions of controversial problems qualified him for the difficult role of presiding over the many agencies, industries and labour and management interests that had a share in industrial mobilization. His strengths were also his weaknesses, and some critics felt that he tolerated differences of viewpoint and delayed decisive action to an extent that interfered with vigorous and firm direction of the war production program.

Creation of the War Production board involved abolition of the Supply Priorities and Allocations board; on Jan. 24, 1942, the OPM was also abolished. Knudsen, appointed lieutenant general, was put in charge of war department production; Hillman remained in WPB until

April as director of the labour division, but then left the government.

The original War Production board consisted, in addition to the chairman, of the secretary of war, secretary of the navy, federal loan administrator, lieutenant general in charge of war department production, director of the WPB labour division (until April 1942), administrator of the OPA, chairman of the Economic Defense board (later the director of the Office of Economic Warfare and then the administrator of the Foreign Economic administration), and the special assistant to the president supervising the defense aid program. In effect, the original board had the same membership as the superseded Supply Priorities and Allocations board. In 1943 the membership was expanded to include the chairman of the War Manpower commission, director of the Office of Defense Transportation, petroleum administrator for war, war food administrator and secretary of agriculture. In late 1944, the director of the Office of Contract Settlement also became a member.

The powers of the chairman were broadly stated in two presidential executive orders, issued on Jan. 16 and 24, 1942. The chairman was to "exercise general direction over the war procurement and production program," to "determine the policies, plans, procedures, and methods of the several Federal departments, establishments, and agencies in respect to war procurement and production, including purchasing, contracting, specifications, and construction; and including conversion, requisitioning, plant expansion, and the financing thereof," and to "issue such directives in respect thereto as he may deem necessary or appropriate."

The chairman was specifically made heir to the powers earlier vested in the Supply Priorities and Allocations board and Office of Production Management. These included authority to determine total requirements of materials and commodities for all purposes, and take steps for the fulfilment of such requirements; to assign priorities to deliveries under contracts and subcontracts deemed necessary to defense of the U.S. or of other countries whose defense was vital to the U.S.; to allocate any material threatened with shortage in supply as a result of defense requirements; to requisition materials and equipment needed for defense of the U.S.; and to place compulsory manufacturing orders enforceable by plant seizure and criminal penalties.

In practice, the WPB chairman's authority was substantially limited by the breadth of production and procurement responsibility of the war and navy departments, the powers vested in coequal civilian agencies and the creation of superagencies with overriding co-ordinative authority. The actual awarding of war contracts and the scheduling and expediting of military production were responsibilities of the armed services largely because Nelson did not want WPB to become too large for effective administration and because he felt that shifting of these responsibilities to WPB in early 1942 would have caused such temporary confusion as to set back munitions production at a most critical period in the war. As a result of this decision, WPB confined itself principally to policy and program determination, production and distribution of materials, production and distribution of industrial equipment and of the components of military and civilian end-products and direct control of civilian production. WPB lacked adequate sanctions with which to assure effective control of the procurement and production work of the armed services, and found it difficult to administer its important materials-allocation powers since they needed to be integrated with the contract-awarding Other civilian agencies reduced the theoretical scope of WPB power. Agencies directly or in effect responsible to the president were established for petroleum and petroleum products, solid fuels, rubber and food, although their functions were not far different from those performed within WPB for other commodities equally important to the war program. In addition to these independent commodity agencies, there were agencies with responsibility for functions that directly affected war production, such as manpower, price, economic warfare, transportation and

and production scheduling decisions of the services.

vital, for in the latter years of the war it was manpower, rather than the materials and commodities under WPB control, that was the critical resource on which the fate of the production program depended.

housing. Of these, the manpower function was the most

Finally, from late 1942 to the end of the war, WPB was subordinated to superagencies established by the president to exercise portions of his responsibilities for co-ordination of war agencies. On Oct. 3, 1942, the president established the Office of Economic Stabilization with overriding authority over certain functions of such agencies as the War Production board, War Labor board and Office of Price Administration. On May 27, 1943, the president created the Office of War Mobilization with very broad powers over the war agencies. This office was further strengthened on Oct. 3, 1944, when it received statutory support and its name was changed to Office of War Mobilization and Reconversion.

For most of the war period, WPB's internal organization was focused on the following functions: (1) top management and policy control; (2) allocation of resources among the agencies serving as spokesmen for military, foreign and civilian requirements; (3) issuance of industry-regulating orders; (4) administration of board policies governing production and distribution; and (5) advisory and technical service to the units responsible for the above four functions.

Top management and policy control were vested in Nelson as chairman until Sept. 1944, when he was succeeded by J. A. Krug. From Feb. 1943 to Aug. 1944, Nelson shared his responsibility with Charles E. Wilson, president of the General Electric company, who held the WPB post of executive vice-chairman. Associated with Wilson was a production executive committee, which brought together the procurement heads of the war and navy departments and the Maritime commission, and which came to play a major role in WPB policy formation. Krug, who had been the Tennessee Valley authority's power engineer and an OPM and WPB executive through most of the war, succeeded to the chairmanship when both Nelson and Wilson resigned as a result of controversies over reconversion policy.

The functions of resources allocation and issuance of industry-wide orders were assigned to a program vice-chairman. For resources allocation purposes he was advised by a requirements committee, composed at its peak of representatives of more than a dozen agencies serving as sponsors of particular types of requirements. The committee reviewed the whole range of requirements each quarter, and, balancing these against the limited supplies of basic materials, made allocations based largely upon relative urgency of need. Much of the detailed work of reviewing requirements and allocating resources was performed by "divisional requirements committees," headed by WPB industry division directors, and composed of

54

representatives of the claimant agencies.

Virtually all limitation and conservation orders and priorities and allocations regulations were issued under the authority of the program vice-chairman; this gave him a firm control of WPB's policies in regulating industrial activities. He was aided in this responsibility by an order clearance committee whose membership was intended to assure that each WPB order was considered from all significant points of view before issuance.

Administration of WPB policies was the responsibility of an operations vice-chairman, who supervised and worked primarily through the industry divisions of WPB. The industry divisions were the focal points for WPB's supply-stimulation activities, for the detailed work of distribution of resources to individual plants and for the initiation of industry-regulating orders and of quarterly allocations of resources among claimant agencies. More than 1,000 industry advisory committees provided a major source of advice to the divisions, but labour advisory committees were never effectively attached to the divisions and, in fact, were inactive until reconversion policy questions arose in 1944 and 1945.

Advisory and technical units aiding in the carrying out of WPB's functions were numerous. Among the more important were the planning committee, which advised Nelson in 1942 and early 1943 on major program and policy problems; the Office of Progress Reports, which appraised critically the record of performance in meeting the monthby-month production goals; the research and statistics staff, which provided the factual foundation for the difficult work of policy determination; the succession of top offices designed both to give labour a voice in WPB policy councils and to represent WPB interests in the manpower work of other agencies; and the conservation division, which sponsored standardization, simplification and substitution measures to save critical materials. During much of the war the Office of Civilian Supply served not only as a claimant agency on behalf of civilian consumers' requirements, but also as an adviser on general economic policy.

The staff of the WPB rose from 7,600 at the beginning of 1942 to a peak of 23,000 a year later, and then declined to 18,000 at the beginning of 1944, 13,000 at the beginning of 1945 and 5,400 on Oct. 31, 1945. Almost all the employees were paid regular government salaries, but several hundred business executives given key posts in WPB were allowed to continue receiving salaries from their companies and received token government salaries of \$1 a year. This practice was severely criticized, but Nelson insisted that experienced business executives could not be obtained at standard government salaries and that adequate safeguards could prevent the misuse of government positions on behalf of the companies paying WPB executives. This problem, plus the fear in some quarters that men drawn from industry for wartime government work even at regular salaries might occasionally confuse the public interest with the special interests of individual industries, prevented the delegation to WPB industry divisions of the extensive powers that they themselves felt desirable for the most effective administration.

The war and navy departments reorganized early in the war in an effort, among other things, to achieve internal co-ordination among their many units participating in the production and procurement program. The war department established the army service forces (at first named the services of supply) under Lieut. Gen. Brehon Somervell, who had direct charge of the many supply services of the

war department. The supply interests of army aviation, however, were handled by the army air forces. The navy department established an Office of Procurement and Material under Vice-Adm. Samuel Robinson, who had the general task of securing co-ordination of the navy department's traditionally autonomous supply bureaus. The Army and Navy Munitions board was by presidential order directed to report to the president through the chairman of WPB. In practice, however, the ANMB remained through most of 1942 a vigorous proponent of the services' point of view and endeavoured to assure a united front by the army and navy on key phases of production policy. After 1942 the ANMB had a less active role.

At the international level, the U.S. war production program was most directly affected by the work of the Combined Raw Materials board, established on Jan. 26, 1942, and the Combined Production and Resources board, established on June 9, 1942. The Combined Raw Materials board, of which W. L. Batt, a top WPB official, was the U.S. member, enabled joint British-U.S. international allocation of critical materials controlled by the two countries, and agreement upon means for increasing the supply of materials. The Combined Production and Resources board, of which the WPB chairman was the U.S. member, was intended to integrate the war production programs of the U.S., United Kingdom and Canada. Although some progress was made on this difficult assignment, the board was more successful with civilian types of production than with munitions production proper, a reflection very largely of WPB's own difficulties in exerting effective control over military production and procurement activities in the U.S.

Programs and Actual Production.—The basic planning of production goals for an all-out war effort had been completed under the Supply Priorities and Allocations board before establishment of the War Production board. The approach taken was based on measurement of the nation's war production potential, and not primarily on the stated requirements of military, foreign and civilian claimants, or on the assumption of limited appropriations for defense. As a result of this approach, it was estimated that in 1942

"Tank Traps" of 1942, as viewed by Bishop of the St. Louis Star-

the U.S. was capable of producing \$40,000,000,000 worth of munitions and war construction. This was about \$13,-000,000,000 greater than existing programs, but the president shortly closed this gap almost twice over by fixing 1942 production goals at something more than \$50,000,-000,000. With an actual war at hand, the armed services quickly skyrocketed their programs, until they were far beyond even the high goals fixed by the president. Actual munitions production and war construction in 1942 was valued at \$46,600,000,000,-more than three and a half times the 1941 figure, but short of the president's goal.

The president not only fixed an over-all 1942 goal for the economy but also set specific goals for production of key munitions items. Table II compares actual production of selected items with the January and May objectives fixed by the president.

Table II.—Presidential Objectives in 1942 and Actual U.S. Production Presidential Objectives Actual Production‡

Munitions Items	Jan. 1942*	May 1942†	
Aeroplanes	60,000	60,000	48,000
All tank-type weapons		46,500	33,100
Tanks	45,000	24,700	24,800
Anti-aircraft guns	20,000	17,400	14,400
tons)	8,000,000	9,000,000	8,000,000

1Letter, the President to Donald M. Nelson, May 1, 1942.
1Wartime Production Achievements and the Reconversion Outlook (1945), pp. 106–109.

The laying out of a 1943 munitions program proved a difficult and hotly contested matter. In Dec. 1941 the president and Nelson had agreed that the 1943 munitions and war construction potential of the country was about \$60,000,000,000. By the end of Feb. 1942, however, the armed services had already formally submitted 1943 programs totalling \$110,000,000,000. Under pressure from the president, who now set a \$75,000,000,000 limit to the 1943 war program, the services reduced their programs in April to \$80,000,000,000, but by mid-July they had raised them again to \$92,000,000,000. These developments were simultaneous with a running dispute over the size of the services' 1942 programs. In fact, the expectation of a deficit in 1942 production as against the services' objectives led to the fear that the services would simply shift this deficit to 1943, with the result that the only way of meeting the tremendous military programs would be so drastically to divert resources to war production as to have 75% of the nation's productive effort assigned to these programs by Dec. 1943. Such a diversion would wreck the economy, for, WPB economists held, neither the U.S. nor any other country could devote more than about half of its output to war production. Consequently, in Nov. 1942, the joint chiefs of staff responded to WPB's representations by reducing the 1943 program to \$80,000,000,000. Subsequent changes altered the program further both to fit revised strategic requirements and to recognize that the estimated production of \$75,000,000,000 to \$80,000,000,000 was not going to be realized.

The importance of getting production objectives into line with production possibilities lay in the facts that unreasonable objectives provided a thoroughly false basis for strategic planning, that excessive demands on industry placed an impossible strain on the existing systems for allocating materials and scheduling production, that unrealistic goals might actually lessen total output by getting far more weapons started in production than could be completed in view of shortages of resources and that such goals would tend to encourage excessive production of easy-to-manufacture items and thus cut production of the hard-to-manufacture items, which were also the mostneeded weapons. Actual munitions production and war construction in 1943 came to about \$65,000,000,000, which was about \$20,000,000,000 above the 1942 figure and more than \$50,000,000,000 above the 1941 figure. This significant achievement, however, fell \$10,000,000,000 to \$15,000,000,-000 short of the estimated 1943 production potential of the country.

Goals for 1943 production of major munitions items had been publicly announced by the president in his Jan. 1942 address to congress. These goals, together with actual 1943 production, are shown in Table III. However, the Jan. 1942 goals were substantially altered during 1942 and 1943 and, therefore, are not fully accurate yardsticks against which to judge 1943 actual production

Table III —Initial Presidential Objectives and Actual U.S. Production in 1943

	President's Objectives	
Munitions Items	Jan. 1942	Actual 1943 Production
Aeroplanes	125,000	85,900
Tanks	75,000	29,500
Anti-aircraft guns	35,000	not available
Machine guns	500,000	830,000
(deadweight tons)	10.000.000	19.000.000

Despite the fact that 1942 and 1943 production goals were not fully met, by the end of 1943 the major pressure on the resources for which WPB was responsible eased. The year 1943 marked the peak year for munitions production and war construction, and Nov. 1943 was the peak month with more than \$5,500,000,000.

In other words, from Nov. 1943 to Feb. 1945 munitions production and war construction fell off slightly each quarter. For all practical purposes this period represented a plateau between the steep ascent of 1942 and 1943 and the precipitous decline in mid-1945.

The substantial completion of the wartime construction program released materials and manpower for production of actual munitions, with the result that munitions production in 1944 was about \$5,000,000,000 greater than in 1943. Nonetheless, the general trend was not significantly upward, and there was no question of the production feasibility of programs presented by the armed services. The only questions were in terms of genuineness of military needs as against the desirability of starting reconversion of portions of industry to civilian production. Actual munitions production and war construction in 1944 were valued at about \$64,000,000,000.

For particular munitions items, 1944 marked the war's peak. This was true for the 95,000 aeroplanes, a doubling of 1942 production that was the more remarkable because the 1944 emphasis on heavier planes meant that by airframe weight the 1942 production had been more than trebled. The navy built 3,200,000 displacement tons of ships-more than three times the 1942 performance and well above that of 1943. Construction of merchant ships, however, was reduced to 16,200,000 deadweight tons, and of tanks to 17,600 from the 1943 peaks.

In 1945 there was a brief halting of the gradual decline of programmed and actual munitions production and war construction, and March actually witnessed a 7% rise in munitions output as compared with February. This brief spurt in response to the unexpected reverses of the United Nations forces in Germany, was succeeded by slight declines which became precipitous with victory in Europe in May 1945 and the Japanese surrender in August. April munitions production was 4% below March's; May's was 7% below that of March; and June's was 12% below that of March. By early September, however, the drop was so

great that the production rate was down 65% from the spring peak.

The WPB was in a difficult position with regard to requirements programs. First, each agency responsible for stating its requirements tended to exaggerate its own needs. This stemmed partly from a mistaken concept of the importance of its own segment of the total war effort, partly from a conviction that the agency would expose itself to greater criticism if it fell short of meeting war needs than if it exceeded them and partly from a padding of estimates to assure that cutting of its stated requirements would still leave its real requirements uncurtailed.

Second, a number of agencies were slow to develop integrated and carefully considered programs, and there was inadequate machinery for integrating programs of agencies with related functions. Where an agency did not integrate its own program, the requirements were often inflated many times over, as each unit, section, division and bureau would tend to pad estimates as they moved up the administrative hierarchy, for fear that an adequate "safety cushion" had not been included at the lower levels. Where groups of related agencies did not work out mutually complementary programs, there were also difficulties. For instance, WPB received separate requirements programs from the army, navy and maritime commission, and early in the war these appeared to be principally developed by supply officers and to have a very tenuous relation to strategic considerations. Similarly, in 1942, WPB received foreign requirements both from the lend-lease administration and the Board of Economic Warfare, and it was not clear which countries filed their requirements with which agency. In addition, Russian requirements came directly through the soviet protocols negotiated by the White House. Over-all programs covering domestic consumers and industrial requirements were also slow to develop. Many of these problems eased as the war progressed. Establishment of official relations between WPB and the joint chiefs of staff in late 1942 enabled reference of important conflicts among military requirements programs to the strategists for decision; this was perhaps the most important advance in production programming for it paved the way for better understanding of the reciprocal relations of strategy and production-an understanding that had been impossible while WPB was isolated from contact with the joint chiefs. Establishment of the Foreign Economic administration in Sept. 1943 merged economic warfare and lend-lease operations. And successive efforts were made to get a more accurate formulation of requirements of civilian consumers, while industrial requirements for such purposes as maintenance and repair of industrial plants and equipment became reasonably stabilized.

Third, WPB had difficulty in probing into the justifications for stated requirements. This was a particular difficulty in connection with military requirements. Precluded from questioning essentiality of need from the strategic standpoint, from obtaining data deemed too secret for divulgence to civilian officials, or in some cases from seeking information from officials at lower military levels, WPB was often reduced to correcting strictly statistical inaccuracies in the official estimates, to encouraging voluntary yielding of claims by one military agency so that an essential requirement of another agency might be met, and, after 1942, to referring major conflicts among military requirements to the joint chiefs of staff. Short shrift was made of WPB economists who ventured to question such matters as the proposed size of the armed forces or the size

of inventories of supplies held by the armed forces. Yet these and other phases of the over-all needs of the services were necessarily determinative of the disposition of resources under WPB control. In the foreign requirements field, it was often difficult because of distance and the paucity of data in the U.S. to appraise legitimacy of foreign nations' requests for materials and requirements. For civilian requirements there was also an inadequacy of information on actual needs. Much of the early calculations of consumers' needs were statistical computations from peacetime production and consumption figures. After sampling surveys indicated strong consumer demand for such items as electric irons, bobby pins, alarm clocks and telephones, it was difficult to convince other claimants that the urgency of need for these products was at all comparable to that for munitions of war. And even if urgency of need for a civilian item were established, there were few touchstones for judging the quantity of the item that should be authorized for production. Even some industrial requirements remained throughout the war a subject of sharp debate. The Office of Defense Transportation consistently condemned WPB's allocations to the railroads as utterly inadequate and as risking a breakdown of the transportation system. Allocations of materials for production of farm machinery and allocations of newsprint to newspapers were subjected to severe censure in congress on grounds of inadequacy.

Much of the progress made in the appraisal of requirements programs resulted from the able work of the WPB requirements committee and its staff. Much was also the result of the introduction in 1943 of the Controlled Materials Plan, a quarterly allocation system that forced the reduction of total requirements programs to the total supply of critical resources, while leaving to the claimant agencies the selection of the segments of their programs to be cut. However, the effectiveness of these pressures for program curtailment weakened in 1944 and 1945, when resources under WPB control became relatively plentiful in relation to crucial needs, and the problem became that of determining the degree to which consumers' less essential needs should be satisfied by direction of resources into civilian production. This in turn raised anew the question of the validity of stated requirements of the armed services in view of the accumulated supplies from previous years' production, the favourable prospects of military operations and the length of time required for munitions in production to reach the battlefronts.

Time served to ease somewhat the problem of analysis of legitimacy of requirements estimates. Significant increases in requirements by any agency above its requirements as stated in previous quarters were held to warrant explanations to WPB and the other agencies concerned in the allocation of resources. And WPB bookkeeping helped to bring into question the requirements of agencies that in a succession of quarters had proved unable to use their full allocations.

Conversion and Concentration.—Conversion to war production of a number of plants normally producing civilian goods was a major objective in the first half of 1942. To the degree that this objective was achieved, the nation could avoid building of new plants, thus saving steel, lumber and other materials critically needed in actual munitions production. It would also save the time required for building new plants, and so get quantity output of munitions at an early date. Furthermore, conversion was necessary to the continued operation of the metal-using plants, for even if a vast quantity of new war facilities had been built, there would not have been a sufficient supply of

Final assembly operations on combat plane fuselages at a Curtiss-Wright plant in Buffalo, N.Y., during 1941. These planes were earmarked for both U.S. and British air forces

metals and other resources for both the new and the old facilities to operate at capacity production.

The doubts of 1941 that the defense program warranted wholesale curtailment of civilian production and conversion of plants to defense production were succeeded in 1942 by a full awareness that the war munitions program was so large as to require drastic measures to bring existing plants, especially those in the durable goods industries, into war production. While in 1941 Knudsen and others had had to urge the armed services to increase their programs and place a heavier load of defense contracts on industry, in the first three months of 1942 the services flooded industry with a tremendous quantity of war contracts, and conversion became an obvious necessity.

Curtailment of less essential civilian production was achieved through WPB's issuance of limitation orders and conservation orders. The former prohibited or reduced the output of specific products; the latter prohibited the use of scarce materials in less essential civilian products. In some cases the materials conservation orders simply saved critical materials for war production by forcing manufacturers to shift to more plentiful materials if they wished to stay in production. But where substitution of a plentiful material for a scarce one was impracticable, the conservation order had the effect of stopping production, thus freeing plants for conversion to war production.

The early 1942 cutoffs applied to gaming machines, metal office furniture, passenger automobiles, radios, phonographs and mechanical refrigerators. The great flood of cutoffs, however, came in May and June, and by mid-1942 the production of nonessential civilian durable goods had been mostly halted. The effects of curtailment and conversion, therefore, were felt in the last five months of 1942, which were the months in which the bulk of 1942 munitions production was concentrated.

The U.S. did not follow Great Britain's and Germany's lead in obtaining still more effective use of its industrial facilities by executing a large-scale program for concentration of civilian industry. Limitation orders that substantially reduced, but did not prohibit, production of

particular civilian products restricted all plants in the curtailed industries to part time civilian production. This often prevented effective conversion of the plants to war work and threatened sharp increases in prices of civilian goods because of the uneconomic rate of production imposed on the plants. Furthermore, it appeared unsound to permit continuation of civilian production in labour shortage areas when such production could be transferred to manpower surplus areas, freeing manpower for war work through shutting of civilian plants in the shortage areas.

In July 1942, the WPB adopted proposals of Leon Henderson and the planning committee for adoption of a concentration program. The program was not effectively implemented, however, and was abandoned early in 1943. By that time it was clear that the nation was not hard-pressed for plant capacity. Meantime, an awkward administrative arrangement for carrying out the program, difficulties in obtaining statistical data basic to the program, opposition by the WPB industry divisions and a ruling that WPB could not legally require plants benefiting from the program to compensate plants closed by the program, had impeded execution of the plans. The only industries covered by concentration orders were those producing stoves, bicycles, typewriters, farm machinery and pulp and paper.

Small Business in the War.-A further attempt to utilize the productive capacity of the U.S. to the full was the emphasis on the use of small business in war production. There were a number of reasons for an apparent preference of the armed services for awarding contracts primarily to large enterprises. The large manufacturing corporations were thought to have the greatest stability, the best management talents, a sense of responsibility for effective performance, the fullest understanding of mass production techniques and in many cases the only experience with production of specialized munitions. In addition, it was easier from the administrative standpoint to deal with a few score large corporations than to work with thousands of small enterprises. Nonetheless, any full scale war production effort would require mobilization of the small plants, for in the aggregate they had substantial productive capacity. Furthermore, with curtailment of civilian production and diversion of critical materials and manpower to war production, the confining of war contracts to large plants might risk a wholesale bankruptcy of small businesses, with profound repercussions on the soundness of the U.S. economic structure.

Concern over this problem led to creation of a succession of special agencies, culminating in congress' establishment of the Smaller War Plants corporation in June 1942. The corporation's board of directors was to be appointed by the chairman of WPB, who also was assigned specific statutory responsibilities in connection with mobilization of small plants. Congress also authorized higher per unit payments under contracts with small plants than under contracts with large plants.

Through much of the defense and war period, the armed services, WPB and the special agencies created for the benefit of small business were criticized for inadequate consideration for small business. Some confusion arose from the demonstrated fact that small business received a relatively small share of the prime contracts, that is, contracts awarded directly by the government's procurement agencies. A storm of criticism arose in July 1941 when statistics were released indicating that three-fourths of

the dollar value of army and navy contracts had gone to 56 companies, and that almost a third of the total value had gone to 6 corporations. While efforts continued to be directed toward spreading prime contracts among more companies, the major channel for bringing small plants into the war program was subcontracting. Once the U.S. was actually at war, the services placed so heavy a load of prime contracts on large companies that the latter were forced to pass the orders along by subcontracts to other plants, many of them small.

As it turned out, smaller enterprises fared very well in the war. Business failures in the country fell steadily from 15,000 in 1939 to 1,200 in 1944. While the number of operating concerns was reduced from 3,300,000 to 2,900,000, this trend was not paralleled in the mining and manufacturing industries, which accounted for war production. In these industries, the number of operating concerns rose from 236,000 in 1939 to 251,000 in 1944. Furthermore, in the same period, the profits of smaller industrial concerns increased nearly 700% before taxes and more than 250% after taxes, a far more favourable record than that of the larger enterprises.

Facilities and Construction.—Construction of new facilities provided still another method of expanding the nation's capacity for production of munitions and of materials and components needed for munitions. The bulk of war facilities were built directly at government expense. Those built directly with private capital were substantially financed by the government. This was done by authorizing the owners to amortize the cost of the facilities over a five-year period (assuming the war did not end sooner) and thereby to charge off most of the cost against the corporations' tax payments to the government.

A major problem in construction of new facilities was the extent to which it drained resources from current production in order to permit greater production peaks a year or two later. Metals were so heavily used in construction that grave questions arose over the wisdom of thus curtailing munitions output in 1942 and 1943, when the need for munitions was acute. In 1942, about 29% of the munitions and war construction program was devoted to construction, and in 1943 the corresponding figure was 13%.

Because there had been no effective central appraisal of needs for such projects, the facilities program as a whole was not closely related to the over-all war program, nor were individual segments of the facilities program correlated with each other. In 1942 and 1943, WPB inaugurated controls designed to keep facilities expansions to those really needed for meeting approved war production goals. WPB itself set the example by sharply cutting plans for expanding facilities designed to produce basic materials, but the agencies sponsoring expansions for military end products were slow to see the necessity of curtailment. As a result, materials-using facilities were over-expanded in relation to materials-producing facilities.

The WPB was never successful in getting all facilities construction projects incorporated in a comprehensive program. It did, however, succeed in providing central review of every major project proposed, and through this review WPB both appraised the necessity for each project and made a detailed review of construction specifications to assure minimum use of critical materials. WPB also controlled the allocations of materials for construction and actually scheduled the delivery of scarce materials and equipment to the major facilities expansion projects for

production of steel, aluminum, aviation gasoline and rubber

These controls over facilities proper were supplemented by rigorous restriction of civilian construction under limitation order L-41. WPB, however, had no substantial control over the military construction program, which was excluded on the ground that decisions as to essentiality of military construction were strategic in character.

Materials and Manpower.—As the adequacy of the nation's plant capacity was demonstrated fairly early in the war, the major wartime bottlenecks proved to be materials, components and manpower. Broadly speaking, the overall shortages developed in that order, with materials shortages dominating 1942 and early 1943, components shortages reaching major prominence in the first half of 1943 and manpower shortages gaining and retaining the spotlight from late 1943 to the end of the war in 1945.

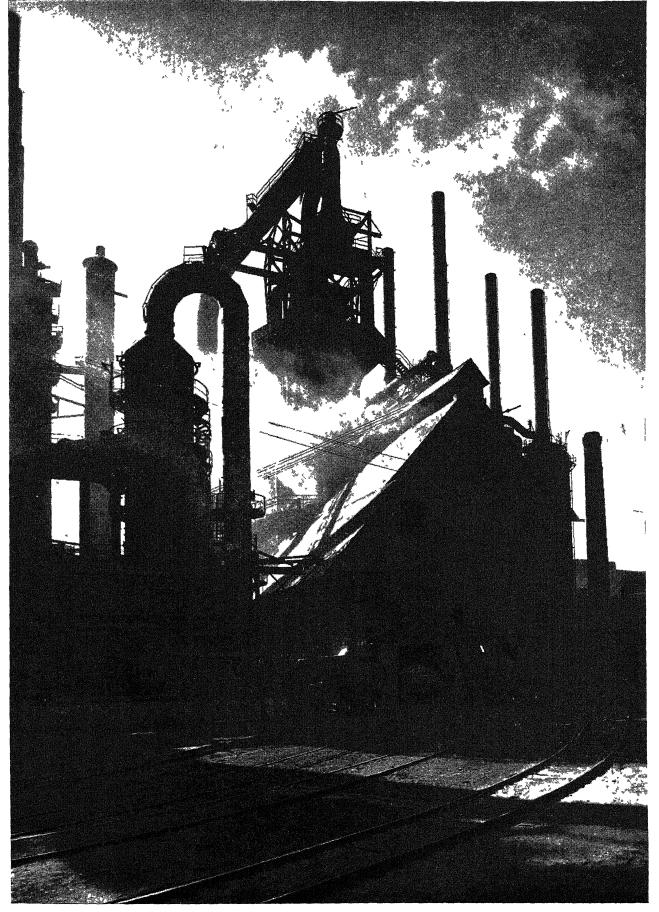

For each of the resources, the character of the shortage problem altered from year to year, and even at shorter intervals. In materials, e.g., two trends were especially notable. One was the shift from shortage of raw materials to shortage of fabricated forms and shapes of the materials (e.g., tubing, sheets, plates, wire). The other trend was the shift from shortage of metals to shortage of nonmetals such as lumber, pulp and paper, textiles and plastics, which early in the war had been thought so plentiful as to warrant use as substitutes for the critical metals. To some extent the trend from plenty to scarcity was evident even within the metals field. Lead, which early in the war had been plentiful, turned out to be critically short in 1944 and 1945.

The supply of materials was augmented through importation and stockpiling, expansion of domestic capacity and fuller utilization of existing capacity. These methods of providing an over-all increase in supply of materials were supplemented by the curtailment of use of critical materials for civilian products and by conservation practices adopted by the armed services. Both of these means of reducing consumption of critical materials had the effect of increasing the availability of materials for the most important military and essential civilian uses.

Importation was facilitated by payment of subsidies to stimulate foreign production, payment of incentive prices for sales to the U.S., abolition of tariff duties on war materials and an elaborate system of priorities and scheduling to control the precious space on ships and planes carrying imports to the U.S. Importation was subject to two major limitations as a reliable means of meeting materials shortages. One was the fact that many major sources of imports came under axis control. The other was that during the height of the submarine attacks on United Nations shipping in 1942, the flow of imports was very seriously interrupted. Both of these limitations lost their weight as territory was regained and as merchant ships were increasingly freed of the hazard of submarine attack.

Stockpiling of materials proved only a modest help in World War II, partly because foreign supplies had not been sought aggressively enough during the defense period, the loss of Malaya and the Philippines had not been anticipated, civilian consumption of imported materials had not been curtailed soon enough and drastically enough and industry's rate of use of materials in war production prevented husbanding of materials in stockpiles. Although at the beginning of 1942 the official stockpile goals were

Blast furnace at the Bethlehem steel works in Pennsylvania which poured out much of the raw material needed in enormous quantities for the conduct of mechanized combat during World War II

generally intended to assure a three years' supply of the principal imported materials, actual stockpiles in most cases never exceeded a year's supply. Consequently, WPB realistically reduced the objectives on the basis of accumulating one year's supply. And, in 1944, after the threats to availability of foreign materials had been substantially reduced, the stock piles of materials wholly imported from abroad were as a general rule cut to a six months' supply.

Expansion of domestic capacity was not only complementary to the importation program, but was in part competitive with it. This was because for certain materials produced both at home and abroad, such as copper, there was serious debate over whether the U.S. should stimulate foreign production at highly profitable price levels or should stimulate the development of submarginal mining properties and the discovery and exploitation of new domestic sources.

The extent to which the materials supply was substantially increased by facilities expansion varied greatly among the individual materials. For such relatively unanticipated demands as synthetic rubber and aviation gasoline, facilities construction accounted for the major share of the increased supply. A great expansion was also achieved for aluminum, whose primary ingot capacity rose from 400,000,000 lb. in 1940 to 2,300,000,000 lb. in 1944. How-

ever, in such an industry as steel, the 17% war-time increase in steel ingot capacity was not as great a contribution to war production as was the ability to take advantage of the 50% under-utilization of capacity that had characterized the steel industry in the 1930s.

Fuller utilization of existing materials production capacity was attained principally through price incentives, measures to meet manpower shortages and shifting of facilities from production of less needed types of materials to those most needed for the manufacture of munitions. Price incentives were provided not only through general price increases, but through special subsidy schemes. The most notable of these grew out of the Office of Price Administration's concern that the effort to stimulate nonferrous metal mining from relatively unprofitable mines and veins might result in a general inflation of metals prices. This danger was largely overcome through a premium price plan that enabled subsidizing of marginal production of copper, lead and zinc, while at the same time requiring that the normal output of these metals be sold under the regular ceiling prices.

Manpower shortages dogged nonferrous metals production and, later in the war, such metals industries operations as those of foundries, forges and brass mills. Unfavourable wages and working conditions in metals in-

Wearing face shields to protect them from burns, these Negro war workers at Edgewood arsenal, Md., are shown filling shells with white phosphorus for use in chemical warfare. The chemical was handled under water because it ignited when in contact with air

dustries, especially mines, accounted for the loss of workers to aircraft, shipbuilding and other industries. A number of skilled miners were also drafted. Adjustment of wages with the approval of the War Labor board, revision of Selective Service regulations to recognize the essential character of mining work and even furloughing of miner-soldiers back to the mines were among the remedial measures adopted.

The most notable example of shifting of existing facilities to increase the production of critically needed types of materials occurred in the steel industry early in the war, when steel plates were critically short for shipbuilding, tank production and plant construction. To meet the problem, steel plate capacity was increased from 460,000 tons in Aug. 1941 to 1,167,000 tons in March 1943. Eighty per cent of this increase was obtained by converting steel strip mills to the production of steel plates, rather than by the building of new plate facilities.

The major resource limiting war production achievements in the last years of the war was manpower. The major manpower problem was not one of inadequacy of total labour supply, but the maldistribution of workers among industries, among geographical areas and between industrial and military service. Generally workers gravitated to those industries that had favourable wages and working conditions and were clearly recognized in Selective Service deferment regulations as contributory to the war effort. While these factors aided the factories producing finished munitions, they created acute problems in factories and mines whose work was basic to war supply.

To adjust to the problem of labour surplus areas and labour shortage areas, WPB in late 1943 established Area Production Urgency committees and the War Manpower commission established complementary Area Manpower Priorities committees. The urgency committees tried to prevent prime contracts from being placed in labour shortage areas, to control the volume of facilities construction in shortage areas and to advise the manpower priorities committees on the relative war urgency of production of individual plants in the area. The manpower priorities committees endeavoured to guide available workers to the most critical plants and to set employment ceilings on individual plants. The War Manpower commission lacked statutory authority to enforce its employment ceilings and hiring regulations. Late in 1944, though, the director of war mobilization and reconversion authorized a policy of withdrawal of WPB priority ratings and allocation rights from plants that, by violating the War Manpower commission rulings, were making ineffective use of materials and facilities in support of war production.

Under the stabilization program the adjustment of wages was under the control of the War Labor board, but the War Production board was active in sponsoring wage increases for industries lagging in war production because of manpower difficulties.

Priorities and Allocations.—The major controls over industry were exercised under the priorities and allocations authority vested by statute in the president and delegated by him to the chairman of the War Production board. This authority was provided by statutes of June 28, 1940, and May 31, 1941, and took final form in section 2 (a) of the Second War Powers Act of March 27, 1942. Priorities could be assigned to deliveries under contracts or orders of the army and navy, or "contracts or orders for the government of any country whose defense the President deems vital to the defense of the United States" under the Lend-Lease act, or "contracts or orders which the President shall deem necessary or appropriate to promote

the defense of the United States," or "subcontracts or suborders which the President shall deem necessary or appropriate to the fulfillment of any contract or order" covered by other provisions of the section. Acceptance of and performance under such contracts and orders in preference to other contracts and orders could be required of individual manufacturers.

Allocation of materials and facilities was provided for by the following provision: "Whenever the President is satisfied that the fulfillment of requirements for the defense of the United States will result in a shortage in the supply of any material or of any facilities for defense or for private account or for export, the President may allocate such material or facilities in such manner, upon such conditions and to such extent as he shall deem necessary or appropriate in the public interest and to promote the national defense."

Priorities were largely relied on until mid-1942; thereafter allocations became the principal instruments of production control. However, allocations were used for some materials as early as 1941, and priority ratings continued throughout the war as a buttress to the allocation system. The priorities system proved adequate only so long as the materials under priority control were not really scarce in relation to essential needs. Under such conditions, the priority ratings merely diverted materials from nonessential uses to essential uses. However, the ratings proved unsatisfactory as instruments for controlling the division of the available supply of materials among essential needs when nonessential uses had already been squeezed out of the picture. Priority ratings were qualitative, rather than quantitative, controls. That is, they could establish that tanks were more important than, say, merchant ships or locomotives, but they were not suitable for limiting the amount of materials to go to tanks in a given month, quarter, or year. What was much the same thing, priorities did not recognize that while the first hundred tanks might be more important than the first hundred ships or locomotives, an additional hundred tanks after 20,000 tanks were on hand would be less important than the first hundred ships or locomotives.

Finally, as materials became scarcer and manufacturers and procurement officers found that their existing ratings could not get them needed materials, there was a steady cheapening of priorities "currency," because all producers and their governmental sponsors pressed for award of higher ratings.

Allocations were developed to cure these defects of the priorities system. Ideally, allocation of a material involved a periodic consideration of the total supply of the material for a given time period, and the firm allocation of that supply among all essential users of the material, such allocation to be guided by the relative importance of products and the marginal war value of additional output of each product.

Although a number of allocation devices for individual materials were used in the course of the war, the two principal allocation schemes for controlling the major output of U.S. industry were the Production Requirements Plan and the Controlled Materials Plan. The Production Requirements Plan was in use on a voluntary basis in the first half of 1942 and on a mandatory basis from July 1942 to March 1943; it was in partial effect from April to June 1943, when the Controlled Materials Plan was also getting started. From June 1943 to the end of the war the Controlled Materials Plan was in full effect.

Under the Production Requirements Plan, WPB required all industrial users of more than \$5,000 worth of basic metals per quarter to apply to WPB for allocation of basic materials and for preference ratings. Each plant's application indicated such facts as recent rate of use of each material, size of inventories, volume of orders on hand and quantitative distribution of the plant's output. These applications, tabulated on an industry basis, enabled the requirements committee to make policy-level allocations of total supplies of material among the 200 principal industries of the country for a given quarter. These over-all allocations were then used as guides by WPB industry divisions, which made specific allocations to individual plants and authorized the use of priority ratings to obtain the approved quantities of materials in the following quarter.

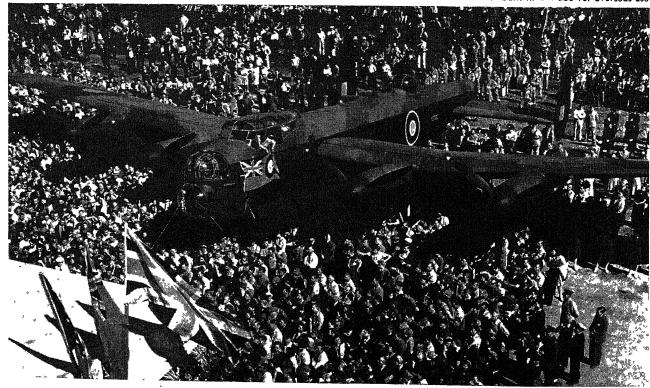

The Production Requirements Plan was distinguishable from most other allocation proposals by its use of the "horizontal allocation" principle, under which WPB directly dealt with every important metal-using plant in the country, regardless of whether it produced end-products or produced components of end products. This method was thought helpful to manufacturers since each plant was treated as a unit, even if it produced more than one product or component. It provided effective control of inventories, since materials allocations to plants were reduced if inventories were excessive. And it assured civilian control of the economy through WPB's detailed control of the flow of materials.

Although it remained in effect for almost a year, pending completion of plans for a substitute method of control, the Production Requirements Plan was officially abandoned in Nov. 1942, when WPB adopted the Controlled Materials Plan. Under this new plan, WPB allocated total

quarterly supplies of steel, copper and aluminum among about a dozen claimant agencies, such as the war department, navy department, Office of Civilian Supply and Board of Economic Warfare. Each claimant agency determined how its allocation should be distributed among its principal programs, and also determined and made allotments to the manufacturers of end-products under the claimant agency's jurisdiction. In turn, each end-product manufacturer divided his allotment under a particular contract among his subcontractors and suppliers, and so on down the production chain. This was a "vertical allocation" system. However, it was supplemented by horizontal allocation of materials to some manufacturers whose production methods would not fit readily in the vertical allocation system, principally because they manufactured such items as nuts and bolts well in advance of receipt of orders.

The Controlled Materials Plan had important virtues. It enabled WPB policy-level allocations to be made in terms of end-product programs such as aircraft, naval ships, merchant ships, ordnance, lend-lease needs and civilian consumer requirements. This meant that these quarterly allocations could reflect the annual production objectives for the whole war production program and could be readily adjusted to changes in strategic objectives by the joint chiefs of staff. In this regard it was superior to the Production Requirements Plan, which had required that quarterly allocations be directed to industries, rather than to claimant agencies responsible for end-product programs. The second principal advantage of the Controlled Materials Plan was that it co-ordinated the flow of materials allocations with the methods already developed for awarding contracts and assigning production schedules. For munitions, the latter two methods had been largely adminis-

Canadians assembled at Malton, Ont., on Aug. 6, 1943, to witness the dedication of the first Lancaster built in Canada for overseas use

tered by the procurement organizations of the war and navy departments. And under the Controlled Materials Plan, the services gained the additional function of allocating materials to munitions producers and indirectly to all producers tied to munitions plants as subcontractors and suppliers. From one point of view, the supplanting of the Production Requirements committee by the Controlled Materials Plan meant a lessened role for WPB in direction of industry. But it also gave WPB a firmer control over end-product programs and, by forcing reduction of production schedules to fit materials allocations, assured real control over the production of U.S. industry.

Abandonment of the Production Requirements Plan was caused by temporary difficulties as much as by inherent defects in the plan. It had the misfortune to be in operation in a period when the total munitions production demands by the armed services were far beyond the capacity of U.S. industry, and when the preference ratings already outstanding throughout industry were being supplanted by new ratings sponsored by the Army and Navy Munitions board. As the first over-all allocation system it also encountered numerous administrative problems that were spared the Controlled Materials Plan. In any event, it was the Production Requirements Plan that guided the flow of materials during the great production build-up of 1942 and part of 1943. And the Controlled Materials Plan carried the nation through the balance of the war with apparent satisfaction to industry, military agencies and civilian agencies.

Production Scheduling and Components.—In late 1942 and early 1943, WPB attempted to recapture firm control of production scheduling, which up to that time had been handled in a relatively independent manner by the armed services. This was in effect a continuation of the battle over reduction of the services' programs to a reasonable approximation of the nation's productive capacity. As the war progressed, materials and components became so heavily demanded for essential programs that WPB felt it must not only bring total requirements into balance with supplies on a yearly basis, but see to it that the month-by-month schedules for production of individual items were in line with resources availability and were in balance with the production prospects for complementary items. Despite strong resistance from the services, Donald M. Nelson and Charles E. Wilson, then the production vice-chairman of WPB, won broad authority in the production scheduling field. In practice, however, WPB concentrated on expediting particular programs, particularly aircraft, destroyer escort vessels and radar equipment, and scheduling deliveries of critical common components.

In Feb. 1943, WPB issued general scheduling order M-293, which enabled WPB to control the order boards of manufacturers of critical common components. Such components were selected manufactured items that were in acute competitive demand for incorporation into such end-products as naval vessels, merchant ships, aircraft and rubber and aviation gasoline plants. WPB analyzed the outstanding orders for such components, directed which orders were to be filled first, and "froze" plants' order boards so that the plants could schedule their production operations without fear that new orders would unsettle the schedule. It also rationalized the distribution of orders by shifting orders from heavily loaded plants to underutilized plants, and by shifting orders for easy-to-make items from highly skilled plants to less skilled plants, thereby freeing the former's machines for work on the most difficult items. By mid-1943 this procedure had resulted in almost completely breaking the components bottleneck.

Despite these successes, WPB had not used its hardwon powers to fix production schedules from end-products down through components to materials. For this it relied on the Controlled Materials Plan's requirement that production schedules be adjusted to fit the amounts of materials allocated. This, however, fell far short of WPB's earlier desire to exercise such detailed surveillance of monthly production scheduling by the services as to assure balance in the flow of complementary items.

Industrial Demobilization.-In 1943 and 1944, most resources other than manpower began to come into easy supply, and the shortages, while requiring vigorous attention, were not of an economy-wide character. Furthermore, as United Nations military advances brought the end of the European war in sight, there was growing concern lest the nation be unprepared either for scattered cutbacks in munitions production or for the wholesale cutbacks expected to follow immediately the final victory in Europe. There was, therefore, a problem with many facets: how to use surplus materials, such as aluminum; how to guide cutbacks of military production, as between governmentowned and privately owned plants, as between large and small plants, and as among local areas; how to use plants no longer needed in military production; what plans to lay for adapting the economy to the one-front war against Japan, which was expected to last for a considerable period after the victory in Europe; and what role to anticipate for the WPB and its staff as the greater part of the economy returned to civilian production.

Nelson held to the view that materials, facilities and manpower no longer needed in military production should be diverted to the production of civilian goods. The armed services held a contrary view, believing that munitions production would suffer because relaxation of restrictions on civilian products would lead to the impression that the war was over for all practical purposes and war workers would shift to jobs in civilian industries. Nelson acceded to the services' position pending successful invasion of western Europe. Immediately after the success of the beachhead in France was assured, Nelson announced his intention to issue four reconversion orders. The most controversial of the orders provided for "spot authorization" of civilian production; that is, for granting of permission by WPB field offices to local manufacturers to resume or expand civilian production, despite WPB limitation orders, where local investigation established that such action would not interfere with war production.

The services opposed all four orders, but took particular exception to the "spot authorization" proposal. Their main contention was that, as manpower was still inadequate in some areas for war production, surplus workers should be encouraged to migrate to such areas, and that to expand civilian production in labour surplus areas would discourage such migration. Nelson, on the other hand, contended that most workers, when thrown out of employment by plants whose military contracts had been cut back, would not migrate but would drift out of the industrial labour force into other less essential types of work in their own communities or would completely leave the labour market. He also felt that if a setback in Europe should occur and demands for munitions programs be again stepped up, the nation would profit most by having maintained its industrial labour force intact, rather than by having dissipated a substantial part of it in order to get a few workers to migrate to labour shortage areas.

The "spot authorization" order was on its face a de-

parture from proposals that WPB postpone resumption of civilian production in an industry until all plants in the industry could start simultaneously in the race for the postwar market. The order, therefore, was adverse to the interests of established firms in civilian industries, since it would facilitate the entry of newcomers into the industries, and to the interests of large corporations still heavily engaged in war work.

Although all four orders were in effect by Aug. 15, 1944, the "spot authorization" order had slight effect, for restrictions on its use were imposed by the director of war mobilization, the services steeply increased their munitions requirements, and WPB itself agreed to suspension of the order in the more critical labour areas.

Issuance of the reconversion orders in the summer of 1944 was opposed not only by the services, but by most of the WPB vice-chairmen. The publicizing of the dispute was popularly assumed to lie behind the president's Aug. 19 announcement that he was sending Nelson on a mission to China, and it was the direct cause of Wilson's resignation as executive vice-chairman. J. A. Krug was appointed acting chairman of WPB, and on Sept. 30, 1944, replaced Nelson as chairman.

In the spring of 1944, WPB established machinery to guide the distribution of cutbacks of military production contracts, so as to protect munitions programs, ease manpower problems and facilitate reconversion. This activity was relatively ineffectual, however, as there were in many cases no alternatives to the cutbacks proposed, there was inadequate information on subcontracting under specific prime contracts, and WPB lacked effective control over contract run-outs (as distinguished from cancellation of contracts only partly fulfilled).

Planning for the partial reconversion to follow victory in Europe turned largely on the question of the degree to which WPB would continue controls over industry. One group argued that controls would be necessary not only to protect munitions production for the one-front war against Japan, but also to prevent a chaotic scramble for scarce materials, to prevent hoarding of materials, to assure that essential civilian needs were met before nonessential needs and to bolster price control. The other group argued that, while a minimum of controls would be needed to protect munitions production, the bulk of the other controls should be scrapped so that U.S. enterprise might return as rapidly as possible to a relatively free competitive system with reliance placed on individual initiative and ingenuity rather than on governmental directives.

A major factor determining the choice of policy was the production requirements of the armed services for continuing the war against Japan. If these requirements were to be so low as to release large amounts of materials for civilian production, there would be little need for continuance of controls, save for a priority system to assure first preference to the meeting of military orders. But if military requirements were to be so high as to leave only modest amounts of materials for civilian production, there would be much more weight to the argument that WPB controls would be needed to assure that civilians' essential needs were met before their nonessential needs, and to provide fair and noninflationary distribution of the limited supplies of materials.

Estimates of military requirements, however, proved to be unstable. The munitions needs for the year following victory in Europe, and assuming continuance of the war with Japan, were variously estimated as 14%, 30%, 40%

and even 50% below 1944 munitions production.

In practice, WPB looked in both directions at once, planning for a sweeping away of most controls, but reserving the right to reinstate controls if the scramble for materials threatened to get out of hand. Much the same policy characterized WPB's development of plans for the period following victory over Japan. Here, however, the critical question was not the size of military requirements, but the desirability of using a number of WPB controls to guide the U.S. economy through the difficult problems of the transition period to maximum peacetime production and full employment.

Victory in Europe initiated a general relaxation of controls, and this was accelerated following the victory over Japan. Between May and Aug. 1945, more than 200 orders and regulations were revoked, and all steel, copper and aluminum not needed for Controlled Materials Plan allocations were thrown on the free market; the plan itself was completely abandoned at the end of Sept. 1945. By Nov. 3, when WPB was succeeded by the Civilian Production administration, there remained only 52 orders and priorities regulations out of the 650 WPB controls that had been in effect at the war's peak. A third of the retained orders concerned textiles, clothing and leather; another group controlled such scarce materials and products as rubber, tin, lead, newsprint and certain chemicals and containers; a third group provided inventory and scheduling controls, and authorized priority ratings for breaking reconversion bottlenecks.

Paralleling the policy of removal of most WPB controls was a policy of liquidating most of the WPB staff. Some 2,000 employees were separated in the fall of 1944, and then the staff was stabilized at about 12,000 employees for the first half of 1945—approximately half the size of WPB at its peak. By the end of Oct. 1945, the staff had been cut to about 5,000 employees, and a large part of WPB's experienced executives had returned to their posts in industry.

By an executive order dated Oct. 4, 1945, the president terminated the WPB, effective as of the close of business on Nov. 3, 1945. The board's remaining functions were assigned to a new Civilian Production administration, which was directed "to further a swift and orderly transition from wartime production to a maximum peacetime production in industry free from wartime Government controls, with due regard for the stability of prices and costs." The task of war production, and of unwinding most of the wartime controls, was finished. (J. W. Fr.)

Contract Terminations.—Early in World War II, shifts in the tide of warfare, changes in terrain and tactics, and, above all, the growth of new weapons and supplies led to the need for terminating war contracts at the convenience of the government before they had been completed. This was a necessary adjunct to the war production program and saved a great deal of time, effort and money. Further, the cessation of hostilities resulted in termination of the vast majority of contracts then outstanding. By Sept. 30, 1946, in the U.S., 318,000 contracts involving cancelled commitments of \$65,300,000,000, which the government had entered into for war production purposes, had been terminated. At the same date, 312,000 (98%) of these contracts, with cancelled commitments of \$59,000,000,000 (90%), had been settled for gross allowances of \$5,900,000,000.

During the early days of the war, the major contracting agencies of the government—the war and navy departments, the maritime commission, the treasury department and the Reconstruction Finance corporation—began to de-

velop their own termination policies. However, the need for uniform planning soon made itself felt, and the Joint Contract Termination board, under the Office of War Mobilization, was established by the principal contracting agencies. The board's work was largely summarized in the "Report on War and Post-War Adjustment Policies" by Bernard M. Baruch and John M. Hancock. The so-called Baruch-Hancock report stressed the need for speed in the settlement of war contracts and for fairness to the contractor and to the government. These general conclusions served as a basis for subsequent legislation and regulation.

The Contract Settlement Act of 1944, which became effective on July 21, 1944, established the Office of Contract Settlement to supervise policy-making for the entire government. However, the actual operation of terminations was left to the various contracting agencies. Robert H. Hinckley, a vice-president of the Sperry corporation and former assistant secretary of commerce for air, was appointed director of Contract Settlement and assumed his duties on July 28, 1944. Hinckley retired as director in the early part of 1946. Col. H. Chapman Rose, general staff corps, deputy director, became his successor. On Oct. 1, 1946, Roger L. Putnam, former mayor of Springfield, Mass., and wartime deputy director of the OCS, assumed the duties of director.

Although the termination of war contracts first received widespread attention in World War II, the procedure had been recognized as far back as the Civil War, and to a further extent in World War I. In 1918 when the end of World War I seemed close at hand, hasty efforts were made to devise a system of settling the sudden termination of contracts which would be effected at the Armistice. Only by the most frantic measures was the government able to avoid total injustice to manufacturers, and to prevent the production of vast quantities of unneeded supplies. As it was, the government found itself compelled, after the Armistice, to continue manufacture and receipt of millions of dollars' worth of new but useless munitions. While the agencies responsible for termination and settlement proceeded as expeditiously as the meagre early preparations would allow, the bulk of settlements took many months to make. Many claims and disputes resulted in litigation which wound its costly way through the courts for 20 years after the Armistice. The whole experience was an object lesson pointing to the vital necessity for formulating the basis of a contractual program which could be used in any future emergency.

During the 1920s and 1930s, termination of government contracts for reasons other than the default of the contractor played a small part in the peacetime procurement. However, the confused settlement experience of 1918 had indicated clearly that cancellation arrangements should be considered. As a result, the draftsmen for war contract forms during the interwar period included some termination provisions in their agreements.

Immediately following the declaration of war on Dec. 7, 1941, the First War Powers act was passed authorizing the president "to enter into contracts and into amendments or modifications of contracts . . . and to make advance, progress and other payments thereon." Executive orders, issued shortly after the act was passed, implemented the provisions of this legislation. These orders reaffirmed the government's power to terminate and settle.

As the purchasing program of World War II increased in early 1942, terminations began to occur. Before long, the contracting agencies sensed the eventual need for an orderly procedure which would facilitate settlements. Moreover, contractors anticipated the danger of possible time lags between actual termination dates, settlement payments and the clearance of plants for the resumption of other production.

The early efforts expended by individual contracting agencies in formulating termination policies were eventual.

The early efforts expended by individual contracting agencies in formulating termination policies were eventually consolidated in the work of the Joint Contract Termination board and elaborated into the Contract Settlement Act of 1944. The act stated broadly that: "It is the policy of the Government, and it shall be the responsibility of the contracting agencies and the Director, to provide war contractors with speedy and fair compensation for the termination of any war contract. . . ."

Generally, the Contract Settlement act provided that termination claims should be settled by negotiation between contracting agency and contractor to the maximum extent feasible. Such settlements would be final in the absence of fraud. In case an agreement could not be reached, the amount due could, subject to right of appeal, be fixed by determination upon the part of the contracting agency. Wherever it would facilitate settlements, the contracting agencies had power to deal directly with subcontractors. The act provided for prompt plant clearance and liberal financing for the contractor in the interval between termination and settlement. Still another important feature of the legislation was a broad provision for the settlement of defective, informal and quasi contracts.

In accordance with further provisions of the act, the Office of Contract Settlement was established in Aug. 1944, along with a contract settlement advisory board and an appeal board. Broad discretionary powers were given the director to organize the settlement program so that it would not hamper war production.

At the same time that wide authority was put into the hands of the director, it was maintained strongly that the OCS should remain on a policy-making level. The firm belief was that actual settlement operations could best be carried through by the agencies which had made the contracts originally. Termination policies were similar to those of the former Joint Contract Termination board. Interagency committees under the Contract Settlement advisory board met with the specialized divisions (accounting, legal, financial, etc.) of the OCS. Members of the individual divisions of the OCS, in turn, consulted with representatives of industry and trade associations in considering the formulation of contract settlement policy. In this way, 20 regulations covering fair compensation, interim financing, plant clearance and other subjects were worked out during the first two years of operation of the OCS.

Termination Articles and Settlements.—The basis for the formulation of uniform termination clauses and articles was established by the Joint Contract Termination board. Under the board's aegis, the basic Uniform Termination Article for Fixed-Price Supply Contracts was devised. Shortly after the establishment of the OCS, similar termination articles were drawn up for insertion into cost-plus-a fixed-fee contracts, construction contracts, preliminary contractual instruments and subcontracts. These termination articles assured uniform handling of claims by all government agencies, eliminated possible conflict and confusion over varying contract provisions and led to swifter and more equitable settlements. Moreover such articles promised to save time, effort and money for prime contractors and their subcontractors.

In 1942, shortly after Pearl Harbor, the first large government terminations took place. It became evident that some simplifying technique had to be substituted for the

overwhelming work required in conjunction with fullaudit settlements. As a result, negotiated settlements were proposed as a means of simplification and speed. Negotiation allowed the government to make settlements on the basis of certain relevant facts and data; the exact accounting methods of settlement by formula were reserved only for cases of negotiation breakdown. The finality of these negotiated settlements, in the absence of fraud, was confirmed by the attorney general in 1942. It was pointed out that negotiated contract settlements could be effected with an optimum of speed and fairness to both contractors and the government if a reviewing agency were limited to checking for fraud.

After several termination accounting guides had been put into use by various agencies during the war, the Joint Contract Termination board early in 1944 devised a uniform "Statement of Principles for Determination of Cost upon Termination of Government Fixed-Price Supply Contracts." This statement was part of the Uniform Article for Fixed-Price Supply Contracts. It recognized costs "sanctioned by commercial accounting practices" including "the direct and indirect manufacturing, selling and distribution, administrative and other costs incurred which are reasonably necessary for the performance of the contract, and are properly allocable or apportionable, under such practices to the contract."

Generally, the provisions of the statement of cost principles endured the test of thousands of terminated fixed-price war contracts.

Both government and industry agreed as to the fairness of the allowances and disallowances. Reasonable profits were paid for work actually done on the terminated portion of contracts.

Under no-cost settlements, the contractor retained all termination inventory and waived his termination claim. The minimization of effort in this method of settlement was of advantage to all concerned. More than 217,000 terminated contracts, or about two-thirds of the total, were settled at no-cost. These accounted for a cancelled commitment value of \$10,000,000,000 out of the over-all figure of \$59,000,000,000 in cancelled commitments settled by Sept. 30, 1946.

In the termination of a large prime contract, subcontractors of various tiers would sometimes number in the hundreds or even thousands. For example, upon termination of tank production by the International Harvester company in March 1943, representing contracts aggregating \$217,000,000, there were 428 immediate subcontractors located in 100 cities in 20 states, and an estimated 2,000 second and third tier subcontractors.

Inasmuch as the government had no direct contractual relationship with subcontractors, fair and fast settlements of their claims had to be effected primarily through the co-

operation of procurement agencies and prime contractors. Just as prime contractors aided subcontractors in securing priorities, financing and engineering, so in contract settlement "primes" had to assist their "subs" with interim financing, filing claims, plant clearance and other termination problems.

The principal machinery utilized for the settlement of subcontractors' claims was the method known as the "vertical settlement system." This procedure utilized the normal connections and relationships of business in the settlement of contracts up the subcontractor chain.

During the war, several termination settlement variations were fostered by the government and industry. In Oct. 1943 the war department took the first steps in establishing a closer relationship between the government and contractors with what later came to be known as the "Consolidated Termination Program." Under this program, field accounting representatives were installed in the plants of war contractors with authority to make accounting examinations of all war department contracts. This was broadened to include the handling of plant clearances. Later, the navy department joined in administering the program. Almost 100 of the country's largest war contractors operated in varying degrees under this termination system.

Another variation to vertical settlements was "Companywide Settlements," offered as a solution for the contractor who found himself in the position of having a large volume of terminated prime and subcontracts with various customers and contracting agencies.

The Company-wide Settlement program provided for the assignment of selected contractors to one service or bureau of the war or navy departments for direct settlement of all claims resulting from termination of both its prime and subcontracts. This method differed from the Consolidated Termination program primarily in that under the latter, the assigned contractor's claim, after accounting review and plant clearance, passed through normal vertical settlement channels. Under the Company-wide procedure, final settlement was made by the designated service or bureau. By Sept. 30, 1946, more than 69,000 claims had been settled under a total of 31 Company-wide Settlement assignments.

The contracting agencies also made direct settlements with subcontractors on individual contracts when necessary, in the interest of expeditious and equitable settlement. Moreover, contractors were given blanket authority to settle claims of less than \$1,000, without governmental approval, where the subcontractor retained or disposed of all inventory. In addition, contracting agencies allowed selected contractors to make final settlement of their subcontractors' claims of \$10,000 or less.

Termination Financing.—One of the primary needs of war contractors was financial assistance during the period when their working capital was tied up in cancelled contracts or subcontracts. In addition to private banking

PENDING

sources, the government provided its own means of interim financing including guaranteed loans; utilization of advance payments; and partial payments.

During the spring of 1945, surveys showed that interim financing was readily accessible to all war contractors. Shortly after V-E day, and again after V-J day, the demand for financ-

ing increased sharply. Partial payments, utilized in termination financing to a far greater extent than advance payments or government-guaranteed loans, were made promptly to the satisfaction of contractors. By Oct. 1946 more than \$3,000,000,000 in partial payments had been made on terminated war contracts.

Inventory Disposal.—A termination notice brought prompt cessation of all work allocable to a contract in both the prime contractors' factory and in the plants of subcontractors. The disposition of the raw materials, work in process, machinery and equipment presented one of the war's major tasks. Seven billion dollars of inventory, or 95% of the expected total, had been cleared by Oct. 1946. Of this, about 56% was sold to third parties or retained by the contractors in possession; 16% was retained by the contracting agencies; and 28% was declared to War Assets administration or its predecessor agencies as surplus property.

A 60-day plant clearance policy was one of the basic tenets of the government in disposing of inventories. Under this policy, the contractor could ask the contracting agency to move the inventory out of his plant and, if the government failed to do this within the 60-day period, he could then move or store the inventory at federal expense. When the bulk of plant clearance requests started to appear toward the end of the war, the OCS sponsored interagency meetings to assure co-ordinated disposal efforts both in Washington, D.C., and in the field. Problems ironed out were broad in scope; allocation of storage space, priority of handling inventories of the various agencies and shipping policies were a few of the questions considered at the inter-agency plant clearance meetings.

Information and Training.—During World War II, several methods were used by individual contractors to speed the administration of their termination settlements. Generally, these were: pretermination planning; creation of a termination unit; preparation of a termination manual; and training of personnel.

An extensive training program for contracting agency personnel was carried on by the government. In addition, more than 75,000 contractor personnel—representing about 40,000 industrial firms—attended termination training sessions given by co-ordinating committees throughout the country. Contractors, business and professional organizations and the newspaper and trade press, as well as private information publications co-operated in the program. These groups voluntarily sponsored settlement publicity and training in the form of articles, special pamphlets and promotion of conferences and instructional sessions.

By Sept. 30, 1946, 112 appeals had been made by contractors to the appeal board of the OCS in the settlement of more than 311,000 terminated war contracts. The reason for this negligible amount of litigation was attributed, in a large part, to the vast planning which went into the Contract Settlement Act of 1944 and policies and procedures thereunder. By Sept. 30, 1946, 103 cases of suspected termination fraud had been reported to the department of justice from all sources. Only 4 of the 52 cases disposed of to that date had warranted criminal or civil proceedings. Table IV gives the status of contract settlement as of Sept. 30, 1946. (R. L. PM.)

Great Britain

During World War II, Britain mobilized its resources perhaps more fully than any other nation, and its achievement was remarkable. British armed forces and auxiliary services increased from 477,000 in June 1939 to 5,092.

ooo in June 1945. Of the equipment used by the armed forces of the British commonwealth and empire (8,750,000 men in all), no less than 70% was produced in the United Kingdom itself, another 10% in the empire and one-fifth from the U.S. Simultaneously, Britain succeeded in ensuring its civilian population a standard of living which was only 15% lower than before the war and much

Table V.—Proportions of British Gross National Income Spent in War Production
Gross National Income National Cost Cost of the Wi

Year	Gross National Income (at current prices)	of the War	in $\%$ of National
	in millio	on £	Income
1938	5,129	348(*)	7
1939	5,490	77 I (*)	14
1940	6,452	2,662	41
1941	7,434	3,668	49
1942	8,113	3,961	49
1943	8,635	4,512	52
1944	8,887	4,493	<i>5</i> 1

*For 1938 and the first 9 months of 1939 the figures in this column represent rearmament expenditure.

higher than in any continental country.

The different phases of Britain's war effort are best illustrated by the increasing proportions of its total gross national income spent as shown in Table V.

The increase in the United Kingdom's war effort is similarly reflected in the expansion of the armed forces and of those producing munitions (see Table VI).

Table VI.-Distribution of Manpower

Year	Labour force	Armed forces	Insured workers em- ployed on orders of the supply departments
1939	21,000,000	600,000	1,202,400 (June)
1941	22,700,000	3,800,000	***
1942	23,500,000	4,500,000	
1943	23,800,000	5,100,000	5,075,500 (June)
June 1944	23,500,000	5,200,000	•••

The vast expansion of both the armed forces and of munition workers emerges clearly from these figures. Millions of workers in other callings of life also went into full-time war employment, such as transport workers, civil servants, etc. The comparison of the total labour force, of those in the armed forces and of those in civilian war employment, can be made for June 1944 between Britain, U.S. and Canada (see Table VII).

Table VII.—Distribution of Manpower (U.K., U.S.A. and Canada)

	Total labour force	Armed forces in millions	Estimated civilian war employment
U.K	23.5	5.2	7.8
U.S	62.2	11.5	13.4*
Canada	5.1	0.8	1.3 †

*Not including agriculture. \dagger Including 25% of farm employment.

Although these figures are not strictly comparable between the three countries, they indicate that in June 1944 about one-third of the U.K. labour force was employed in producing munitions and in civilian war work compared with only about one quarter in the U.S. and Canada. The total armed forces amounted to 22% of the working population in the U.K., 18.5% in the U.S. and 16% in Canada. Altogether, 55% of the working population was in the forces or on war work in the U.K., 40% in the U.S. (exclusive of agriculture) and 41% in Canada (including 25% of farm employment).

This same point, namely that there was a division of labour between the United Nations, each contributing what it could best do under the circumstances, must be

Table VIII.—Munitions Production Indices

1944	•	•	•		•	•	•	•	٠	•	•	•	•	•		97.4	108.3	102.9

considered when comparing total production of munitions.

The production of munitions increased rapidly in Britain between 1939 and 1942, and there was further expansion in 1943–44. In 1944 munition production ran at more than six times the rate of production in Sept. 1939 and at about twice the 1941 rate of production. Until early in 1942, British munition production was bigger than the corresponding U.S. production, but when the U.S. entered the war the rate of its munition production increased very rapidly. The 1944 production of munitions index underestimates somewhat production in the U.K., as it did not make allowance for such construction works as the "mulberry harbour," etc., but taking the 1943 figures as typical, the volumes of munitions production in the three countries were related as follows: U.S. nearly 4 to U.K. 1; U.K. more than 5 to Canada 1.

Organization.—Britain had not prepared for total war. At the outbreak of World War II, therefore, there was not in existence a well thought-out central organization for war production; the machinery developed as needs arose and problems required solution. Broadly speaking, the supreme co-ordinating agency was the minister of defense (Winston Churchill, from May 10, 1940 to his resignation, July 26, 1945) and the defense committee of the cabinet whose business it was to define the tasks of the production ministries in relation to the broad lines of war strategy. Day-to-day co-ordination was ensured at first by different high level committees until by 1941–42 the ministry of production was established which took over a number of co-ordinating functions.

For munitions, there was no single supply organization. Broadly speaking, the ministry of supply took charge of weapons and supplies for the army. From May 1940 onward, the ministry of aircraft production did the same for the royal air force, while the provision of ships and naval stores remained the responsibility of the two comptrollers of the admiralty, the one for the navy, and the other for merchant ship building. Actual distribution of functions was, however, not quite so rigid. The resources in short supply for which all three supply departments were clamouring were usually dealt with by one agency only. Machine tools were the bottle-neck in the early stages of the war, and their production and supply was controlled for all users by the ministry of supply and later by the ministry of production. Raw materials were controlled for all users throughout by the ministry of supply. The procurement of labour, a most important factor, was for all purposes the responsibility of the ministry of labour.

Although war production proper was controlled by the above-mentioned supply departments, other government departments were for obvious reasons also deeply concerned with many of its aspects. It was the duty of the board of trade, e.g., to look after the minimum civilian requirements. In this capacity it exercised control over production and distribution in order to release and divert resources such as factory space, machinery and labour from nonessential civilian production to war production. The ministries of food and agriculture played a vital role in other important spheres of the war effort, apart from the central directing department, the treasury. Without a proper financial policy that skilfully combined taxation and borrowing it would have been impossible either to mobilize all the resources of Britain for the war or to set aside such a high proportion of the national income for war purposes. Apart from the big central departments concerned with the war effort, there were the regional organizations of the different government departments whose work was later co-ordinated to a certain extent by the interdepartmental regional board. Many vital production problems, such as finding new capacity, saving transport, subcontracts, etc., could only be settled locally.

The co-ordination of Britain's war effort with that of its Allies, notably the U.S., also passed through several stages. Before Pearl Harbor, this co-ordination was informal, but in the summer and autumn of 1941 a system began to emerge. After Pearl Harbor, together with the combined chiefs of staff, a combined materials assignment board was set up, based on Washington, D.C., to allocate according to strategic needs, munitions produced in the U.S. and similarly, a board in London to allocate munitions produced in the British empire. These boards were later supplemented by a combined raw materials board and a combined production and resources board, both in Washington, mainly concerned to fit British needs from the U.S. into the total U.S. supply program. Eventually, a vast network of Anglo-U.S. supply contracts developed. Difficulties notwithstanding, a common outlook and a large measure of understanding enabled both sides to deal rationally with interallied supply problems.

Execution.—In 1939, Britain was still predominantly a free-enterprise country in the sense that the means of production were owned by private entrepreneurs. The execution of war production programs required a considerable measure of central direction and control with which the business community readily complied. But it was not then intended that the state as such should take over ownership of industry to secure the execution of the war program. Only a very small part of the munitions industry, such as the royal ordnance factories or the admiralty ship yards, were state-owned.

Although there was a central co-ordination of war production, the placing of actual production orders remained the task of the three main supply departments, whose policies followed eclectic lines. In regard to army equipment the ministry of supply and previously the director general of munition production in the war office relied for certain jobs on the state-owned royal ordnance factories. Thus the filling of ammunition and to a large extent the manufacture of small arms, ammunition and explosives were carried out by the royal ordnance factories. At the same time the ministry of supply tried to bring into the field of armament production the widest possible range of private firms, mostly engaged in the engineering and chemical trades.

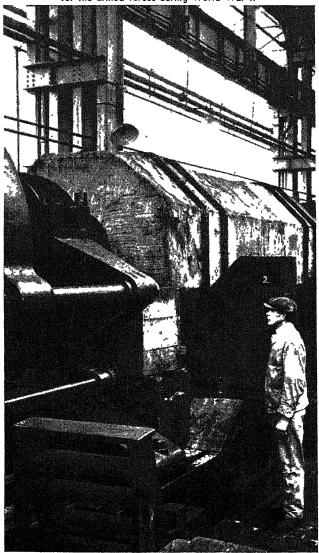

In regard to aircraft and its equipment, the ministry of aircraft production and the air ministry before it, followed the policy of nursing a group of specialized private firms whose relations with the air ministry were sufficiently intimate to enable it to guide and control design and production of aeroplanes. These "family firms" were in private hands, although the state provided a substantial proportion of their capital. Eventually, a wide range of other firms were brought into this field, in particular some big motor car and electrical firms. The admiralty also relied on dividing contracts between government yards and private shipbuilders. Their big craft were mainly built by some specialized firms, the smaller craft, especially in the later stages of the war, by a wider range of other firms.

Apart from work directly contracted for the supply departments, many firms and industries were brought into war production by other methods. The raw material producing industries, such as iron and steel, nonferrous metals, while remaining in private hands, were, of course, sub-

jected to controls and their output allocated according to war needs. Moreover, war contractors relied on subcontracting to a large extent. Originally, the main contractors themselves found their subcontractors, but at later stages, the government departments undertook the ordering and distribution of many parts, accessories and components. Relations between contractors and government, and even more, relations between contractor and contractor, were also influenced by the so-called group system. Several firms engaged in the production of the same weapon worked together as a team with departmental direction and assistance, in producing the required equipment.

The central direction of war production was, of course, not confined to the placing of orders and contracts by the supply departments. It went much beyond that stage. There was machinery for securing factory space, raw materials and labour as well as finance for war production. Thus the government provided capital for the conversion and expansion of existing plant or for building and equipping new factories. In such cases the government retained ownership of the assets. The government also provided working capital either by progress payments or advances; lastly, tax concessions were given to write off

British munitions plant which manufactured 14-inch naval guns for the armed forces during World War II

quickly building and equipment which would cease to be of value by the end of the war. In some industries, the conversion from peacetime to wartime production could be achieved overnight.

One of the main factors in the successful wartime conversion of British economy was the ability of firms and whole industries to turn to entirely new fields of production, e.g., some made gun parts instead of stockings; a public transport undertaking, the London Passenger Transport board, produced bombers in its workshops. With the conversion of factories and workshops, many workers automatically turned to war production; others switched, or were switched, into war industries.

Mobilization of Manpower.-Mobilization of manpower and its allocation as between production and the armed services was one of the fundamental problems of wartime organization. In its legal aspects, mobilization was governed by the national service (armed forces) act, 1939, and its subsequent amendments which provided for compulsory enlistment into the fighting services of men of military age. As the war proceeded, the scope of this legislation had to be extended. Enlistment of women into the auxiliary women's services became compulsory in Dec. 1941. Industrial recruitment, originally on a voluntary basis, also became subject to compulsory registration (March 1941). To prevent depletion of manpower reserves and too quick a turnover of labour in defense and other essential industries, the ministry of labour, in March 1941, issued the Essential Works order under which, in such industries, employers lost the right of hiring and firing, and workers the right of quitting their jobs, except with the ministry's consent. Finally, under schedules of reserved occupations set up at the outbreak of the war, certain essential workers were maintained in civilian occupations instead of being drafted into the armed services.

Between June 1939 and June 1944, when the peak was reached, the total number of men aged 14 to 64 and of women aged 14 to 59 in the services or in industrial employment in Great Britain rose from 18,500,000 to 22,000,000, the combined result of a reduction of the number of unemployed by 1,250,000 and an expansion of the total labour force of the country by 2,250,000 persons not previously in industrial employment. In these figures two part-time workers were reckoned equal to one full-time worker. Unqualified by this distinction the addition to the labour force amounted to 4,500,000 (versus 3,500,000) units.

In addition to the increase in units, the average hours worked by the working population also increased from 46.5 in Oct. 1938 to 50 hr. in July 1943 and 48.6 in July 1944. In the munitions industries the hours worked were even longer. In extent, the mobilization of manpower achieved altogether greatly exceeded that of World War I. In this, the contribution made by women was decisive. Out of the 3,500,000 added to the labour force, 2,250,000 were women.

At the middle of 1944, of the 22,000,000 of working age, 47% or 10,300,000 were in the services or in full-time civil defense or employed in engineering, shipbuilding, metals and chemicals, *i.e.*, industries mainly concerned with the output of munitions; 26% or 5,700,000 were in agriculture, mining, national and local government service, public utilities, transport, shipping, including the merchant navy, in the manufacture of food, drink and tobacco, *i.e.*, industries which it was necessary to maintain or expand during the war; 27% or 6,000,000 were in building and civil engineering, the textile and clothing and other manufac-

turing industries, the distributive trades and civilian services. These figures when compared with those for 1939 represent a very important shift in the occupational distribution of the working population, as can be seen in Table IX. In mid-1944, as compared with mid-1939, the number of persons employed in the munitions industrieshad increased by about two-thirds; those in the basic industries and services had remained largely unchanged, and those in other industries and services had decreased by more than one-third. In 1939, of the total population subject to unemployment insurance, 1,200,000 were employed on orders for the supply departments; in 1943, 5,100,000; in the same period those employed on orders for the home market decreased from 4,400,000 to 2,300,ooo and those employed on export orders decreased from 900,000 to 240,000.

Raw Material Resources.-With Britain fully mobilized, the shortage of manpower became the chief factor limiting expansion of output. Hardly less important a factor was the supply of industrial raw materials. Except for coal and iron ore, Britain's industries had to rely almost entirely on imports. In the earlier stages of the war, in particular after the loss of the European continent and the far east as sources of supply, the Allies experienced not only relative, but also absolute, shortages of strategic raw materials, further aggravated by the shipping problem that arose on account of the intensive warfare at sea. Demands on tonnage were reduced by three methods: first, by expanding the home production of some raw materials, e.g., iron ore, flax, timber, light metals, etc.; secondly, by the recovery of waste material through intensive salvage drives; thirdly, by economizing as far as possible imported, i.e. scarce, raw materials in the production processes (by changes in specifi-

cations, use of substitute materials, etc.) Similar considerations also applied to the importation of foodstuffs. The reduction in imports of all kinds is shown in Table X.

Capital Equipment.—Britain fought the war largely with the industrial equipment which it had possessed before the war. There was neither time nor resources to create wholly new industries, a few cases excepted; but substantial capital investment for war purposes occurred in existing industries. This, however, was not on a scale comparable with similar investment in the U.S. In the absence of accurate statistical data the increase in the production of machine tools provides a significant pointer. The turnover of the machine tool industry rose from £19,000,000 in 1939 to £47,000,000 in 1942, the peak year of production. Over the same period the number of people employed in making machine tools increased from 25,000 to approximately 85,000. The tooling up of British war factories was not completed until 1943.

Production of Armaments.—In 1944 total armaments production, as mentioned above, ran at more than six times the rate of Sept. 1939. Table XI shows the main items produced between Sept. 1939 and June 1944 as well as the rate of production at these two dates, and the rate of production in the peak year.

the services Aircraft	919,111	6,100.0	15,600.0	16,600.0 (1942)
	100 /00			
Total aircraft	102,609	731.0	2,435.0	2,435.0 (1944)
Heavy bombers	10,018		481.0	481.0 (1944)
Fighters		268.0	232.0	356.0 (1942)
riginers	38,025	112.0	942.0	942.0 (1944)

Table XI shows a vast expansion in virtually all the categories of basic munitions. At different phases of the war it became necessary to push more energetically the requirements of one service or other, e.g., the expansion of aircraft production began earlier (in 1940) than that of tank production or the building of small naval craft, but eventually, it was immense in all three categories.

War production was largely a race against time. That race was won in the end, but not without difficulties, disappointments and occasional sharp controversies, in particular over tank and aircraft production. Final success notwithstanding, the planning of production was not perfect, and the fighting services did not always secure the right equipment in right quantity and quality, at the right time. More than once, Churchill's speeches in the early stages of the war indicated the lamentable lack of aircraft and tanks. Yet, in the end, there was not only an immense increase in the quantities produced, but also a vast improvement in quality coupled with an increasingly quick response of the armament industries to changes in the design and the types of equipment produced.

In the aircraft industry, e.g., there was a constant increase in the structural weight of aircraft owing to the changeover to more powerful types, particularly heavy bombers. In the case of tanks and antitank equipment,

there was a similar increase in the firing power of the tanks, and similar improvements occurred among virtually the whole range of armament production. In regard to naval armament, substantial quantities of additional or wholly new equipment, such as radar, control gear and devices for protection against mines, were required in the later stages of the war. The numerous new types of armament required an equal diversification and quantitative increase of ammunition, engineers' stores, signal equipment, food stores and stores of army clothing similarly expanded.

The building of merchant ships was not perhaps armaments production in the strict sense of the term, but in Britain's position as a heavy importer of foodstuffs and raw materials from overseas, merchant tonnage constituted an important economic weapon. Table XII shows merchant tonnage lost through sea warfare and new tonnage built in Britain during World War II. New construction, in 1941–43, was greater in volume than in similar circumstances during World War I, although it required this time more specialized equipment as well as defensive armament.

Table XII.—Shipping Losses and Merchant Shipbuilding

							٠		Losses of A Total	Aerchant Ships British	New merchant vessels com- pleted in the U.K. (Tankers and nontankers of 100 gross tons and more)
									'000 g	ross tons	'000 gross tons
1939	S	ep	t	D	ec				925	498	243
1940									4,549	2,725	810
1941									4,693	3,047	1,158
1942									8,338	3,695	1.302
1943									3.646	1.678	1.204
1944											1.020
1045											744

The picture of armaments production would not be complete without mentioning the part played by repair and reconditioning services. The ships of the royal navy which were frequently in action and continuously at sea required refitting and repair. In the case of merchant vessels repairs absorbed more than half of the manpower available for the construction of such ships. The proportion of repair work was also very high in the aircraft industry, where for every six aircraft newly produced in 1943, four aircraft underwent major repairs.

Human Side of War Production.—Statistics alone cannot convey the whole story of British war production. No less impressive than its quantitative side was its human side. The endurance and the will to work of the average workman, severely handicapped by the blackout, bombing and shortages of all kinds, was matched by the inventiveness and ingenuity of scientists and engineers. Britain took the lead in developing radar, the jet propulsion engine, the drug penicillin, the Bailey temporary bridge, the "mulberry" floating harbour, and the "Pluto" pipe-line under the ocean, a record of invention and discovery that would have been highly creditable even if it had been achieved under conditions less adverse. No less creditable was the response of the whole nation to the call of its government. This wholehearted response was reflected in the excellent labour relations which prevailed in industry throughout World War II and the absence of any but minor strikes.

Two characteristics were outstanding in British war production: ingenuity in improvisation and ability in organization. The first provided the solution of some urgent problems, as when garages were converted into war factories and a big aircraft industry was created from modest beginnings, by subcontracting and other unorthodox methods. The second characteristic showed in the extensive mobilization of labour, much of it unskilled, in the satisfactory rationing arrangements of essential supplies, in-

cluding food, and in a skilful financial policy. But neither ingenious improvisation nor organizing and planning ability could have succeeded without the full and conscious co-operation of the whole nation. This co-operation was largely voluntary—not the least reason for its success in quantity and quality.

A Record (The Times, London, 1945); Reports of Select Committee on National Expenditure (1940–45); The Economist (weekly, London 1940–45), Bulletins of Oxford University Institute of Statistics.

British Empire.—Britain and the U.S. were the great arsenals of the western Allies. The British empire also produced munitions, but its main contribution lay necessarily in the supply of essential foodstuffs and raw materials, except in the case of Canada, which in a way had become the third great arsenal. In 1943–44, at its peak, Canadian war production amounted to one-fifth (or including raw materials, one-fourth) of the war production of the United Kingdom. Yet what is more amazing, virtually its whole war industry had been created after 1939.

Canada's labour force expanded from 4,300,000 to 5,100,000 between 1939 and 1944. The strength of the armed forces increased from 20,000 in 1939 to 800,000 in 1944, *i.e.*, from practically nil to 16% of the working population. In addition, 1,300,000 persons were in civilian war employment in 1944, of whom about 700,000 were in war industries proper. The biggest number were in aircraft production (118,000), shipbuilding (109,000) and mechanical transport (57,000).

Of all the munitions produced, only 30% were used by Canada, the rest by the other Allies.

Canada's war production was also an interesting example of organization. Canada was virtually the only country within the United Nations which handled all war supply problems through a single agency, the centralized department of munitions and supply. At the same time the control of all primary and secondary materials—whether for civilian or for munition use—came under the joint control of the department of munitions and supply and the wartime prices and trade board.

As distinct from the British, but similar to the U.S. case, most of the Canadian war industry was newly created and built. By the end of Dec. 1944 the department of munitions had made commitments for investment in war production facilities totalling nearly \$850,000,000. Another interesting feature of Canadian war production was the setting up of crown companies to operate new war plants or to deal with the building up and distribution of stocks of key materials. Table XIII indicates both the

order of magnitude and the rate of increase in the Canadian war effort.

The war production of Australia and New Zealand took a different form, owing both to their different industrial structure and to their different geographical position. In the latter respect, their war production was connected with the different phases of the war, first in the Mediterranean and then in the Pacific. Both dominions supplied Britain throughout the war with foodstuffs and raw materials. In addition, Australia bore the burden of forming the base and supply centre for the armies fighting against the Japanese. A great deal of Australia's resources went also to supply other parts of the empire through the Eastern Group Supply council. Exports to Eastern Supply (India and Ceylon) increased fivefold. Even New Zealand succeeded in providing at least in part the means of its defense and in equipping an expeditionary force. At the same time it supplied vital foodstuffs to Britain as well as to the South Pacific forces.

Table XIV shows the changes in the distribution of working population during the war for the two Pacific dominions.

In 1946 less factual information was available on the war effort of other parts of the British empire. This did not mean, however, that their contribution was in any way less important or less impressive in relation to their resources. South Africa, e.g., not only contributed heavily to the arming of its own troops who fought in North Africa and the western desert, but also became the main repair shop for the middle east front. India experienced a vast industrial expansion, and its few ordnance factories and railway workshops developed into a real war industry, while the different British colonies, being mainly agricultural communities, served the war effort both by reducing their imports and by supplying more of their vital native produce.

U. S. S. R.

Although the colossal war effort of the U.S.S.R. was beyond question, more data were available on the brilliant

Assembling tanks at a soviet plant in the Urals, where workers maintained day and night schedules during World War II

of harnessing ruthlessly all the resources of Europe to the service of the German war effort was successful. The extent of Europe's contribution to the German war effort and the

These estimates, put forward by U.S. experts using German statistical sources, indicate that the volume of the German national income (i.e., its value after eliminating changes in prices) expanded less during the war than did that of the Allied countries. Without foreign contributions as shown in the table (which, incidentally, do not include the contributions of slave labour and prisoners of war employed in Germany proper), Germany would have been unable to expand its war effort.

latter's increase in general, can be seen in Table XVII.

Europe's contribution was not necessarily made in the form of producing munitions, although in the later stages of the war several new factories were set up or moved to the east (Austria, Czechoslovakia). Europe contributed men, raw materials and a variety of products which made it possible for the German industry to concentrate on producing munitions. As can be seen from table XVII, an increasing proportion of the total available product was claimed by the German government, and used largely for purposes of the war.

Views held abroad on Germany's war effort and war production underwent a material change when, after the German collapse, British and U.S. experts made a study of its war economy. The picture emerging from these studies suggested a German war effort far less "total" or "thorough" than that of either Britain or the U.S.S.R. Nor was the German war organization particularly efficient. Labour (especially female labour) was never fully mobilized, and the drastic reduction in civilian consumption standards was forced on the Germans only in the last stages of the war.

Beyond any doubt Germany had started preparations for an aggressive war at the very beginning of the nazi regime. But it appeared in retrospect, that while the army leaders believed in "rearmament in depth," Hitler was in favour of "rearmament in width," i.e., of the maximum increase in immediate striking power in order to support his blitz warfare tactics. The four-year plan of 1936 provided for this type of rearmament (i.e., a maximum concentration on production of finished munitions, etc.), and the Polish and western campaigns appeared to have justified Hitler's conception. In consequence, during the critical period between the French eclipse and the soviet campaign, no particular effort was made in Germany to expand war production, and the rate of armament production remained more or less stationary. It was asserted that, at the end of Sept. 1941, Hitler, believing that the war was nearly won, ordered a reduction in armament production.

Only their defeat before Moscow and the entry of the U.S. into the war in Dec. 1941 made the Germans face the prospect of a prolonged war. In Feb. 1942 Albert Speer was appointed minister of armaments, a position which he held virtually to the end, and this marked a new era and a vast expansion in Germany's armament production.

Prior to Speer's appointment, there was no central

authority in charge of war production. The Heereswaffenamt, the traditional military procurement authority, retained the direction of armament production. The air ministry controlled

teats of the soviet armies in the field than on the number of tanks or aircraft or guns produced. The western Allies helped the Russians generously through lend-lease, but obviously Russia's own war production must have been immense.

The results of soviet war production were the more impressive as the U.S.S.R., of the three main Allies, suffered by far the greatest loss of industrial potential through the

impressive as the U.S.S.R., of the three main Allies, suffered by far the greatest loss of industrial potential through the invasion of its territory and the destruction of its productive economy by the Germans. The removal of industries from the invaded areas in 1941 and 1942 was successful; and, in addition to the transfer of the factories, the resources of the eastern provinces, notably the Urals, were greatly expanded, especially the production of iron and steel, coal, aluminum and water power. But these developments could not entirely make up for the loss of the industrial capacity of the Ukraine. The Donbas (Donets Basin) region had, before 1941, accounted for nearly half the coal and iron of the U.S.S.R. After the recapture of this area in 1943, the destruction found there was enormous, their rehabilitation and the renewal of their contribution to the total war production were necessarily slow. Thus, on account of the flooding of the mines by the Germans, the coal production of the Donets basin in March 1944 was no more than 13% of the prewar total although the Donets had been recaptured in Sept. 1943.

As shown in table XV the total military expenditure of the U.S.S.R. in relation to its national income was higher in 1939 than that of the western democracies, though in the decisive years all of them contributed very nearly half of their resources to the war (the U.K. a little more, the U.S. and the U.S.S.R. a little less). Table XVI shows U.S.S.R. war expenditure as a proportion of total government expenditure.

Table XVI shows that in order to allocate such a high proportion of its resources to the war effort, the U.S.S.R. was compelled not only to reduce the consumption levels of the population, but had also to reduce the amounts spent on economic, social and cultural development.

Germany

The history of war production in continental Europe (excluding the U.S.S.R.) during 1937–45 was in the main the history of the German war effort. Having overrun the Low Countries and France in 1940, Germany launched its "new order" program which included all countries under its direct or indirect control. The long-term objective of this plan, viz., the integration of the European economy, was never achieved, but the short-term objective

the aircraft industry, and the ministry of national economy controlled the industries producing basic materials for the forces or for vital civilian consumption. The general administration of industry was in the hands of 32 different "groups of industries" (Wirtschaftsgruppen) representing branches of production. The new minister of armaments, to start with, was given coordinating functions only, for the purpose of obtaining the most urgently needed types of munitions. But his powers were rapidly extended and came to cover all industries producing munitions for the army. In Nov. 1943 he took control of naval armaments, in March 1944 of fighter aircraft production and in July 1944 of the armament industry as a whole.

The mobilization of labour, the recruitment of foreign labour and the allocation of labour in general remained separately organized.

Speer, as minister of armaments, created a new organization of committees and "rings," subdivided according to end-products (tanks, guns, etc.) and staffed by production experts (engineers, etc.) These committees were given the task of increasing production by combining maximum economy of labour and materials (i.e., thorough rationalization) with maximum utilization of capacity. A central planning bureau was also set up, the first serious attempt at a thorough planning of German war economy; but it is believed that its influence was small. This belated German all-out production effort appears to have been very successful. Despite its coincidence with the intensified Allied air offensive against Germany, there was a big increase in the total armaments produced, as can be seen from the production indices in Table XVIII.

(Table prepared by Dr. R. Wagenfuehr of the German armament ministry. It covers 90% of finished armaments production)

At its peak in July 1944 German armament production (mainly of tanks and aircraft) was three times as high as in early 1942. From then onward a steady decline set in as a result of the Allied air and other offensives, and German armament production never recovered.

The different stages of German war production become clear from a study of the mobilization of labour, the supply of raw materials, the availability of capital equipment for producing armaments and, finally, from a review of its results, by types of munitions.

Manpower.—At the outbreak of World War II, Germany was already mobilized. Its army of unemployed had already been mopped up during the years of war preparations, and a large proportion of its labour force had already been shifted into the war industries. Both in Britain and in the U.S., these stages were only reached during the first few years of the war. The number of workers employed in German industry rose from 9,100,000 to 11,200,000 in the ten years 1929–39; virtually the whole increase went into the capital goods industries. In July 1939 nearly a quarter of all industrial workers, viz., 2,500,000 persons, were working on direct orders of the armed forces (and many others indirectly).

Germany apparently possessed substantial manpower reserves in Germany proper when war broke out, and in

fact made little use of such labour reserves (e.g., women) as it did possess.

The first few years of the war brought nevertheless, substantial changes in the manpower position. The first factor was the drafting of 7,500,000 men from the civilian labour force into the army. The gap thus created was made good partly by shifting more people from nonessential industries (handicraft, distribution, etc.) into the war industries. Simultaneously the German victories opened up a new large source of manpower for the reich in the form of prisoners of war and civilian labour recruited abroad. Table XIX illustrates the mobilization of manpower.

Table XIX.—Manpower Mobilization in Germany between 1939 and 1944

			rce	,			
		Germans	Foreigners and prisoners of war	Total mobilized	Cumulative losses	Active strength	Total active labour force
		(1)	(2)	(3)	(4)	(5)	(6)
				(000,00	0 omitted)		Columns (1)+(2)+(5)
May 31 May 31 Sep. 30	, 1944	29.0	0.3 7.1 7.5	1.4 12.4 13.0	3.3 3.9	1.4 9.4 9.1	40.8 45.2 45.0

As Table XIX shows, there was at the most an addition of 1,000,000 Germans to the total labour force after 1939 (800,000 men and 200,000 women); in fact, the number of German women employed decreased in the first two war years. The number of men in the armed forces expanded throughout the war, in spite of the severe losses, and virtually the whole gap was made good by foreign and prisoner labour. The latter went first into agriculture, but soon they were also needed in industry, and the ratio of foreign and prisoner labour (25%) in war production proper, was higher than either in agriculture (18%) or in industry in general (14%). As there was no significant strain on the labour force, the average working week increased only slightly, from 47.8 hr. in Sept. 1939 to 49.5 in Sept. 1941, 48.7 in Sept. 1942 and 47.9 in Sept. 1943 though longer hours were worked in particular industries. Later, when the wehrmacht suffered severe losses, and the recruitment of foreign workers did not fill the gaps, more determined efforts were made at mobilization. A farreaching conscription measure was taken first in Jan. 1943 and then in July 1944, when a 60-hr. week was introduced by decree, but these measures were never fully carried out. Under the 1943 decree, 3,500,000 additional persons registered (mostly women), but the number of women in the total labour force hardly increased. In the nazi party there was strong objection to such an increase, and totalitarian Germany could not face popular resistance from inside.

Even though new recruitment yielded little result in Germany proper, the mobilization policy was successful in shifting more people into the war industries. In Jan. 1943 all enterprises not directly connected with the war effort were either shut down or concentrated, and the workers shifted into the war industries. Table XX illus-

Source N Kaldor German War Economy (see bibliography)
These figures would suggest that in 1943 Germany was less thoroughly mobilized than Great Britain Germany's last big effort came in 1944

in the civilian sector

It is interesting to compare the distribution of German and British manpower as between different industries in 1939 and in 1943, and this is done in table XXI

Raw Materials.—Germany's war leaders always regarded its reliance on imported raw materials as its great strate gic weakness, and great preparations were made before World War II to remedy it First of all stocks were accu mulated Simultaneously, under the four year plan of 1936, Germany tried to expand the production of indigenous raw materials and to develop the output of synthetic raw materials. By contrast, Britain never thought of wasting manpower on production of synthetic materials and relied on keeping its sea lanes open for getting supplies from overseas The German policy was successful in regard to synthetic oil and rubber, but it did not make Germany self sufficient. Synthetic oil production increased from 1,300 000 tons in 1938 to 6,000,000 in 1944 Synthetic rubber production increased from 5 000 tons in 1939 to 134 000 tons in 1944 The German conquest of Europe made a vast contribution to nazi Germany's raw material supplies In this way it secured big stocks all over Europe as well as important current supplies, eg, oil from Ru mania, copper from Yugoslavia, Norway and Finland, bauxite from Hungary, France and Yugoslavia, ore from Lorraine and Luxembourg, etc. As the supply of materials which it was wont to produce at home (such as coal and steel) had satisfied the requirements of the armament pro gram, the raw materials position until early in 1944 was, generally speaking, comfortable From then onward short ages appeared The heavy bombing of the synthetic oil plants in 1944 was regarded as one of the reasons for Ger man collapse

Mobilization of Capital Equipment.—Although the in dustrial structure of Germany was not very different from that of Britain and the US, its capital goods industries had always been somewhat over dimensioned in relation to its consumption goods industries Germany's capacity to produce capital goods was always far in excess of its normal home requirements. Germany was, of course, one of the big world exporters of heavy machinery, but this excess capacity served it well when the switch over to war time production took place The supply of machine tools, of which Germany was one of the great world suppliers provided a good example The German machine tool in dustry hardly expanded during World War II, but Ger many possessed an ample stock as well as a large flow of supplies throughout the war and did not experience the same difficulties in this field as Britain and the US That plant facilities and general machinery were not in short supply was clearly shown by the fact that throughout the war most of the German industries worked on a single shift system There were exceptions to this rule (eg, a small proportion of those producing tanks, aircraft en gines, etc., worked on a double shift system), shortages and bottlenecks occurred in particular industries, such as oil and chemicals, and at particular times but generally speaking there was no shortage of capital equipment

Production of Particular Types of Munitions.—The end products which all countries at war aim at producing in vast quantities are munitions, and the output figures, by all types of weapons indicate their success in applying their mobilized resources to the war job

Table XXII gives an illuminating comparison between the output of munitions in Germany and Great Britain in 1940, 1943 and 1944

Table XXII -- Munitions Output in Germany and the UK

		n number	s of units)			
	1940		1943		1944	
	Germany	UK	Germany	UK	Germany	UK
A rcraft Tanks	10 826 1 467	15 049 1 397	25 527 12,061	26 263 7 467	39 807 17 459	14 609 2 474
Other armoured vehicles	no data 5.499	6 044 3.410	14 906 26 904	24 375 17 314	19 280 40 684	13,957

These figures show that already in 1940 Britain outproduced Germany in aircraft and maintained its superiority, except in 1944, when Germany made a final spurt In tanks Germany was also behind in 1940–42, until, in 1943 and 1944 it made a tremendous effort Virtually the same applied to guns, German output leaped up only in 1943 and 1944

After Germany had stolen a march on the peaceful democracies and equipped itself for blitzkrieg, it was too late to prepare its people for such an all out war effort as the democracies produced Germany went "all out' only in the years 1942–44, but never achieved the same complete mobilization of resources as did Britain or the US, because from Sept 1944 onward heavy air attacks disorganized its transport system, and destroyed part of its oil supplies This, together with its heavy losses in the field in the east and the west led to a complete industrial collapse.

Japan

Few nations had gambled more recklessly with their future than did Japan in 1941 when it launched the Pacific war. The stakes were high—the control of all east Asia. The opportunity appeared to present itself as a result of Hitler's successes in Europe and the preoccupation of the U.S., as yet unmobilized, with that threat. Only by seizing the rich producing areas of southeast Asia could Japan relieve the continued dependence of its growing military machine on overseas supplies of oil and other strategic materials.

Accordingly, in the fall of 1941 Japan's army and navy leaders decided, without effective civilian opposition, to risk all in one daring military effort

That it was a gamble is clear from the plan determined upon ¹ This called for swift conquest of the southern zone, and the establishment of a defense perimeter on the outlying islands. With the new resources thus secured, it was hoped that Japan could successfully withstand any Allied counteroffensive until the time when US indifference and

567

¹Data were taken largely from the findings of the U.S. Strategic Bombing survey as presented in its Summary Report (Pacific War) (1946) and in 'The Japanese War Economy 1940 45,' by Jerome B Cohen Far Eastern Survey Dec 4 1946 See also Supreme Commander for the Allied Powers, Summation of Non Military Activities in Japan (monthly Sept., 1945 et seq.)

war weariness would make possible an advantageous, negotiated peace.

To achieve this end presupposed avoiding an all-out war in which Japan's limited resources would be no match for the preponderant power of the U.S.

The history of the war was the history of the miscarriage of these plans. Japanese assumptions, of course, were in error.

Once the resources and the will of the U. S. people were fully mobilized, and the nazi empire began to crumble under Allied blows, it was only a question of time until Japan too would be overwhelmed.

Japan entered the war with an economy greatly strengthened by a decade of unprecedented industrial expansion. From 1930-41 its real gross national product nearly doubled, with military outlays and investments in munitions industry already accounting for 23% of the total in the latter year. Production of ingot steel in Japan proper rose from 2,200,000 to 6,800,000 tons. Coal output increased from 31,400,000 to 55,600,000 tons, electric generating capacity from 4,300,000 to 9,400,000 kilowatts, and aircraft production from 400 to 5,000 planes. The growing demands of war industry for raw materials led in turn to strenuous efforts to develop the potentialities of "Manchoukuo," Korea and North China. Japan remained basically dependent, however, on nonempire sources of oil (90%), bauxite, rubber and a number of ferroalloys and nonferrous metals.

This was partially compensated for by the accumulation of strategic stock piles, including at the time of Pearl Harbor an estimated two-year reserve of oil—43,000,000 barrels.

Early successes in the Pacific heightened the spirit of confidence in Japan. They apparently accounted for its failure in 1942 to step up war production to its full potentiality and to fashion effective centralized controls for this purpose. Not until the beginning of Allied advances in the South and central Pacific did Japanese leaders reluctantly abandon the hope of a war of limited liability and embark on full scale mobilization. Gross national product, discounting price changes, increased from 39,-800,000,000 yen in the fiscal year beginning April 1940 to only 41,000,000,000 yen in 1942. By 1944 it had reached 50,000,000,000, with 52% devoted to war expenditures and capital outlays for munition production. Under a new munitions ministry priority controls were strengthened in favour of key industries. Monthly aircraft production rose from 700 planes of all types in the summer of 1942 to a peak of 2,572 in Sept. 1944. Construction of steel merchant ships jumped from 238,000 tons in 1941 to 1,600,000 tons in 1944. Basic industrial capacity was also enlarged; steel ingot capacity, e.g., reached 14,000,000 tons in the

By 1944, however, the Japanese war economy was already beginning to sag at its foundations. The production of basic materials, in fact, had passed its peak in 1943. In part this represented failures at the top in centralized planning and allocation of resources, owing to unresolved conflicts among the army, navy and business interests. In part it reflected the growing scarcity of technical skills, and the effects of fatigue and deprivation among a people reduced by 1944 to an average per capita diet of 1,900 calories.

But the decisive factor was the progressive decline in imports of essential war materials as Allied air and submarine attacks first cut shipping lanes from the southern

zone and finally isolated the home islands almost entirely from the mainland.

Japan began the war with 6,000,000 tons of merchant shipping. It built or acquired an additional 4,100,000 tons. Some 8,900,000 tons were destroyed or put out of action, 55% by Allied submarines alone. Oil shipments from the Indies began to dwindle as early as Aug. 1943. By April 1945 they had ceased entirely, and oil stocks were nearing exhaustion. Bauxite imports were virtually cut off by the end of 1944. The shrinkage in shipments of iron ore and coking coal from China cut steel ingot production from 7,800,000 tons in the fiscal year 1943 to 5,900,000 in 1944. By the first quarter of 1945 (April-June) it had slumped to an annual rate of 1,500,000 tons. Strenuous efforts to develop the production of synthetic oil, domestic iron and North China aluminous shale yielded only meagre results. The consequence was a disastrous fall in the output of fuel, aircraft, ships and munitions for the fighting forces.

Even before long-range bombing of the Japanese home islands began in earnest, late in 1944, it was clear that Japan had lost the war. By July 1945, just before the surrender, over-all industrial output had dwindled to 40% of the 1944 peak, and was dropping precipitously. In the opinion of the U.S. Strategic Bombing survey, the blockade alone would have led virtually to this result. To its strangling effects, however, was now added the systematic destruction of Japanese industries and cities by air bombardment. Some 40% of the built-up area of 66 cities was laid in ruins, largely by fire bombing. This campaign spread demoralization among the people and progressively advanced the day when Japan's military leaders would be compelled publicly to acknowledge defeat. When the atom bomb was finally released early in August and the soviet union entered the war, Japan surrendered within the week.

War Production Board

See War and Defense Agencies; War Production.

Relief of human misery had always invoked the compassion and generosity of the American people in peace as well as in wartime. This tradition accounted in large measure for the fact that the voluntary war relief efforts of the people of the U.S. during World War II actually began in the early 1930s when political, religious and ideological persecution forced a continuously growing stream of refugees to flee from Germany. Many groups in the U.S. raised funds to help them reach places of relative security. Civil strife in Spain and Japanese aggression in China gave rise to additional efforts to help those whose lives, homes and families were broken. The invasion of Poland with the gradual spread of hostilities throughout Europe and Asia and the eventual involvement of the U.S. caused the initiation and expansion of many additional voluntary efforts. These activities were for both foreign civilian war sufferers and the servicemen and servicewomen of the U.S. and its Allies who needed a variety of hospitality, recreational welfare and protective services over and above those provided by their governments.

Volume of Relief.—During the active war years, 1939–45, Americans contributed more than \$1,000,000,000 to nationwide voluntary war-relief agencies which provided a variety of services and supplies to people affected by the war. Doubtless many additional millions of dollars were solicited and received from the American people by local relief organizations which were not supervised by the wartime federal government agency, the President's War Relief Control board. These funds, in addition to the millions of dollars voluntarily donated to the American Red Cross and the millions of tax funds turned over to the American Red Cross, swelled the total amount of money spent for war relief by voluntary U.S. organizations.

Early Governmental Action.—In 1939, congress passed the Neutrality act which prohibited various forms of U.S. economic activity with countries declared belligerent by the president. One section of the act (section 8[b]) provided, however, that U.S. foreign relief work could be continued in and for belligerent countries if conducted in accordance with U.S. governmental regulations. These included registration and reporting of activities by all U.S. relief agencies (except the American Red Cross) to the department of state. Between Sept. 1939 and June 30, 1942, 545 agencies reported activities including receipt and expenditure of about \$75,000,000. During the same period, agencies helping people in countries not declared belligerent collected and spent about \$25,000,000.

Because of the increasing number of public charitable appeals, President F. D. Roosevelt on March 13, 1941, appointed the President's Committee on War Relief agencies to make a study of this problem in the public interest. The committee, composed of Joseph E. Davies as chairman, Charles P. Taft and Frederick P. Keppel, recommended to the president the creation of a small wartime governmental board to license and supervise all national voluntary war-relief agencies. On July 25, 1942, the president issued an executive order establishing the President's War Relief Control board. Administration of section 8(b) of the Neutrality act was transferred from the department of state to the board which was authorized to control not only relief for belligerent countries but also other war related relief activities, both domestic and foreign, except: (1) those of the American Red Cross; (2) those through established religious bodies as a part of their regular activities; and (3) those of a domestic character confined to local and intrastate areas.

The Board's Work.—The board was instructed by the president to use its authority to effect co-ordination of war relief with other established charities and to promote efficiency and economy of relief administration. As groups of organizations with similar objectives applied for registration, the board, under the president's mandate to eliminate or merge agencies when necessary in the interests of efficiency and economy, withheld licensing of competitive and overlapping organizations until their activities were adequately co-ordinated.

The board's review of the proposed programs of new applicants for war relief licences and its continuous examination of the certified reports and public audits of receipts and expenditures required from organizations operating under its jurisdiction were conducted with special attention to efficiency of administration. In some instances, examination of the record showed unjustifiable waste of relief contributions because of high overhead costs. Wellintentioned but inexperienced administration, huge expenditures for unproductive "benefits" and other promotional schemes, or other overhead expenditures out of proportion to the public support obtained were found in a number of cases to consume 50%, 60% or 70% of the contributions received. Cases of this sort were far and few between, but when the record revealed such a situation, representatives of the relief agency were called to a hearing to show reasons why registration should not be revoked for failure to comply with the board's regulations concerning reasonable efficiency and economy of operation. The effect of this action, combined with the increased efficiency of the relief organizations during the period of the board's supervision, was to reduce sharply the overhead costs of private foreign relief administration. The reduction from the high ratios of 1941 and 1942 meant that about \$23,000,000 to \$25,000,000 of the funds contributed in 1943, 1944 and 1945 were used for relief and welfare services rather than for overhead costs.

The second phase of the effort to reduce the number of independent appeals for war-relief funds was the formation of the National War fund in Jan. 1943 (at the instance of the chairman of the War Relief Control board). The National War fund was established as a private organization (under the leadership of Winthrop Aldrich of New York city, N.Y. and a national board of directors from each state in the union) to collaborate with established community chests in a united appeal for local charities and national war philanthropies, to organize a concurrent appeal in non-chest areas, and to distribute the resulting contributions to war-relief and welfare agencies approved by the President's War Relief Control board.

Initially as a part of the action on co-ordination of fund raising and later as a service to the officials of the many relief agencies, the War Relief Control board called upon the advice and information of other governmental agencies on problems affecting the planning and operation of foreign relief projects overseas and the development of services in the U.S. and abroad for members of the armed services. For instance, priorities and export allocations of materials in short supply were secured by the board from the departments of agriculture and commerce and reallotted to each agency; permission for the agencies to transfer funds abroad was secured from the treasury department; shipping space was obtained for the agencies on the basis of appeals by the board to the War Shipping administration and the military authorities; the board supported the agencies reasonable requests for passports, visas, priority

569

army transportation and billeting overseas for the agencies' personnel.

Safeguarding Public Interest.—As one of the agencies of the federal government, which as a whole was directing the U.S. war effort, the board was responsible to the general public through the president, for seeing that money voluntarily donated for relief was spent efficiently and for the purpose collected-namely, relief. The board was responsible also for seeing that private relief made its maximum contribution to the furtherance of the war purpose, which included assuring that the operation of specific private relief activities of U.S. citizens was not directly inconsistent with the wartime foreign policies of the U.S. as expressed by the state department. This was a delicate task. Almost without exception, either humanitarian or religious convictions or political attitudes with respect to events in other countries, singly or in combination, motivated the U.S. leadership and support of large segments of the U.S. public for specific U.S. voluntary relief efforts. The board and its staff made every effort in the administration of its duties to be impartial in its dealings with all agencies irrespective of the religious convictions or political leanings of the individuals directing the affairs of the relief agency.

Council of Voluntary Agencies.—The board's work and that of the National War fund were greatly strengthened by the formation in 1943 of an American Council of Voluntary Agencies for Foreign Service as a nonofficial body to promote joint planning and action on matters of mutual interest to its members. The council's work was carried out through a series of country committees (on France, Poland, Hungary, etc.) and functional committees (on purchasing, displaced persons, child welfare). Through these committees, the relief agencies themselves met many problems of interagency co-ordination.

Among the major accomplishments of the council and agencies in voluntary co-ordination were the formation of two agencies through which the component agency members carried out common objectives. They were CARE (Co-operative for American Remittances to Europe, Inc.) and CRALOG (Council of Relief Agencies Licensed to Operate in Germany).

CARE was a nonprofit individual food-package service from which individuals and organizations could order standard food parcels for delivery by CARE to designated individuals and groups in several European countries. The CARE plan of relief was accepted by the governments of Norway, Finland, the Netherlands, Belgium, France, Italy, Greece, Yugoslavia, Czechoslovakia and Poland, and by the military authorities in Austria and Germany. The agreements with these authorities provided for protection of the stock piles of packages warehoused in the foreign countries, freedom from customs duties or other taxes, and freedom from ration control.

CRALOG was a joint operation primarily of church relief agencies interested in aiding German civilians. In the fall of 1946, 15 agencies jointly planned, shipped and distributed relief for Germany through approved church channels in Germany under the supervision of the various Allied military authorities. The wisdom and success of such joint operations suggested to the agencies that they voluntarily combine their operations in certain other countries, and work progressed to this end.

End of Wartime Control.—At the board's request, the president agreed to the termination of the board's wartime controls effective May 15, 1946. This request was made because of the board's conviction that the furtherance of the

war purpose no longer required federal control over solicitation of contributions for private charities which had been invoked as a war measure and accepted only as such by the U.S. people.

The Advisory Committee on Voluntary Foreign Aid, composed of Charles P. Taft as chairman, Chester C. Davis and William L. Batt, appointed by the secretary of state and the secretary of agriculture, was established under authority of similar letters of May 14, 1946, from the president to the secretaries of these departments, "to tie together the governmental and private programs in the field of foreign relief and to work with the Famine Emergency Committee and other interested agencies and groups"; and for the purpose of continuing the liaison, advisory and consultative functions formerly performed by the president's War Relief Control board.

Warren, Earl

Warren (1891—), U.S. politician, was born March 19, 1891, in Los Angeles, Calif. He worked his way through the University of California, Berkeley, Calif., graduating in 1912. He received his law degree in 1914 and was admitted to the bar the same year. He was a lieutenant in the U.S. army during World War I.

His first political position of importance was that of deputy city attorney of Oakland, 1919–20. In 1925 he was elected district attorney, holding this position until 1939, when he was elected state attorney general on the Republican ticket. In 1942 he was nominated as Republican candidate for governor. He also ran in the Democratic primaries but lost to the Democratic incumbent, Gov. Cuthbert Olson, by the narrow margin of 100,000 votes. However, he defeated Olson in the elections by a majority of 342,000, carrying all of California's 58 counties.

In the 1946 elections he was nominated for governor of California by both the Republican and Democratic parties. This unprecedented action projected him into the limelight as a presidential possibility for 1948 because of the near certainty that he could carry California.

Warsaw

As capital of restored Poland, Warsaw, from 1918 onward, had made rapid progress in every respect; by absorbing neighbouring districts its area was increased from 46 sq.mi. (1920) to 54 sq.mi. (1939). Its population grew from 937,000 (1921) to 1,289,000 (est. Jan. 1, 1939). According to the 1931 census, 66.8% of Warsaw inhabitants were Roman Catholics, and 30.2% of the Jewish faith; 70.5% used Polish as their mother tongue, and 28.4% were Yiddish or Hebrew-speaking.

From the very first day of World War II Warsaw was subject to air bombing by the Germans. The damage of the first weeks increased to an appalling extent during the siege which began on Sept. 14, 1939. Two days later Gen. Julian Rómmel, the military commander of Warsaw, rejected the demand for capitulation. Stefan Starzyński, the popular mayor of Warsaw, who had done much for restor-

The royal castle at Warsaw, viewed from the east bank of the Vistula river, as it appeared before and after the destruction of the Polish capital during World War II

ing the old buildings and erecting the new ones, became the soul of the resistance. Warsaw was faithful to the courageous motto of its coat of arms: Contemnit procellas (Defying the tempest). The worst days were Sept. 25 and 26, when the Germans submitted the capital to continuous bombardment by their heaviest artillery. Tens of thousands of people were killed and fires were started which lasted for a week. On Sept. 27 Warsaw—without ammunition and food, without water and light—capitulated. The Germans entered the city on Oct. 1, Hitler being present. The heroic Starzyński was deported to the concentration camp of Buchenwald, where he was murdered in 1942. German bombs and heavy shells destroyed about 25% of Warsaw's 24,800 dwelling houses.

Among the monumental buildings of historic value in the city, the royal castle, the ministry of finance, the ministry of agriculture, the opera and the national theatre were laid in ruins.

The five years of German occupation were for Warsaw the years of searches, street roundups, evictions, arrests, takings of hostages and executions, but also of indomitable resistance. The large Jewish quarter in Warsaw was turned into a separate police district and cut off from the rest of the city by a wall. When in May 1943 the Germans decided upon its "liquidation," the ghetto rose.

In that battle the Polish underground helped the Jews, but the struggle was unequal and the ghetto became a heap of rubble.

In July 1944 the soviet armies sweeping westward began to approach Warsaw. The Germans were evacuating the city, carrying off everything of value; the inhabitants were being rounded up to build fortifications and for deportation to the reich. On July 30 the "Kościuszko" wireless station (under the control of the Russian-sponsored Polish national council) broadcast an appeal to the people of Warsaw saying: "The soviet armies are close to Praga (a suburb of Warsaw on the right bank of the Vistula). They are bringing us liberation. People of Warsaw, assist the soviet army to cross the Vistula." In these circumstances Tadeusz Komorowski (General Bor), commander in chief of the Polish home (underground) army, in agreement with the Warsaw delegates of the Polish government in London, gave orders to rise on Aug. 1. The uprising took the Germans by surprise, and two days later the Poles were masters of the major part of the city. On Aug. 9, speaking in Moscow with Stanislaw Mikolajczyk, Polish prime minister, Generalissimo Joseph Stalin said that originally he hoped to see the soviet armies in the Polish capital on Aug. 6; a successful German counterattack from Modlin had forced Marshal Konstantin Rokossovski's forces to a temporary retreat, but the Russians would soon be in Warsaw. Generalissimo Stalin's optimism was easy to understand: Rokossovski had under his command about 75 divisions, a third of them armoured, as against 22 German divisions. For some reason, however, Rokossovski remained inactive for a month, during which the Germans, under the command of the S.S. Obergruppenfuehrer Erich von dem Bach-Zelewski, started a series of operations against the Polish forces in Warsaw.

The German commander had at his disposal artillery of the largest calibre, mortars, heavy tanks and aircraft. The defenders of Warsaw had only light weapons in insufficient numbers. On Sept. 14 Rokossovski took Praga but did not even try to cross the Vistula. Meanwhile the Germans were reducing the areas in possession of the Polish home army and destroying Warsaw with an incredible passion of hatred, dynamiting brick and stone houses and burning the wooden ones. The population was ordered to leave.

On Oct. 2, after an epic battle of 63 days, Gen. Komorowski was forced to lay down his arms.

As a result of the siege of 1939, of the liquidation of the ghetto in 1943 and of the uprising of 1944, Warsaw lost more than 80% of its dwelling houses. When in Jan. 1945 the Russians finally liberated the city, only 153,000 of its inhabitants were there, and of these, four-fifths in the suburb of Praga. On Sept. 1, 1946, the population of the Polish capital was already 522,945, living mostly in houses temporarily repaired. Under the supervision of the new mayor, Ludwik Tolwinski, and his chief architect, Roman Piotrowski, the plans for the new Warsaw were prepared. About Zl.15,000,000,000 (one zloty=one U.S. cent) were earmarked for the first three years' work. It was announced in the Polish press that Generalissimo Stalin had promised that the U.S.S.R. would bear half of the cost of the rebuilding of Warsaw.

War Shipping Administration

See WAR AND DEFENSE AGENCIES.

A state in the extreme northwest United States, popularly known as the "Evergreen state," Washington was admitted to the union Nov. 11, 1889. Total area, 68,192 sq.mi., including 66,977 sq.mi. of land. Population (1940) 1,736,191, including 1,525,812 native born and 210,379 foreign born. On Nov. 1, 1943, the bureau of census estimated the population of the state at 1,905,239. Capital, Olympia (13,254). The three largest cities are Seattle (368,302); Spokane (122,001); and Tacoma (109,408). The urban population in 1940 was 921,969 or 53.1%.

The legislature met in its 25th session from Jan. 11 to March 11, 1937. The social security system was placed under a department, administered under the merit system, and was made conformable to federal law. A maximum of 60 hours per week was prescribed for domestic labour, significant in view of the decision of the U.S. supreme court sustaining the Washington minimum wage law. A teachers' retirement system was substituted for the old arrangement of local funds. The Congress of Industrial Organizations-American Federation of Labor rivalry appeared in the strike on the Seattle Star, while Spokane saw the emergence of the closed shop issue in a laundry strike which failed after it had tied up the industry for two months and also witnessed a sit-down demonstration of Work Projects administration workers.

The chief state officers in 1937 were: Clarence D. Martin, governor; Victor A. Meyers, lieutenant governor; Ernest N. Hutchinson, secretary of state; Cliff Yelle, auditor; Phil H. Gallagher, treasurer; G. W. Hamilton, attorney general; A. C. Martin, commissioner of public lands; William A. Sullivan, insurance commissioner; Stanley F. Atwood, superintendent of public instruction; Edward J. Reilly, speaker of the assembly; and William J. Steinert, chief justice.

Citizens of the state acknowledged the importance of the 1938 election by registering to the number of 898,159, an all-time high, and casting 632,813 votes, a record for a nonpresidential year. Homer T. Bone, Democratic incumbent and senior U.S. senator, defeated Ewing D. Colvin (Rep.) and the state returned an entire Democratic delegation of six congressmen. C. G. Jeffers defeated Ernest M. Card for position number three on the supreme court; William J. Steinert and George B. Simpson were selected for positions one and two without contest. The 1938 legislature was preponderantly Democratic, but the conservative elements of the party had a decided majority. Probably more significant than candidates were certain inftiative measures submitted for popular verdict. A constitutional amendment authorizing the levy of a graduated tax on net incomes was defeated. Most controversial was measure no. 130, which would have required "a majority vote of employees concerned-before a strike may be called." Supported by a group known as "Associated Farmers and Women of Washington" and fought by organized labour, it was defeated by a narrow count of 268,848 for to 295,431 against. Reenacted was the so-called 40-mill limit bill which had a clause authorizing the legislature to drop the state levy of 2 mills and permit cities and towns to make a commensurate increase. Successful also was an act providing nonpartisian elections for state and county superintendents of schools.

Washington celebrated its 50th anniversary of statehood in 1939. The legislature met in its 26th session from Jan. 9 to March 9. To meet the serious problem of finance, former exemptions from-the sales tax of such items as fruit, fresh vegetables, dairy products and unsweetened bread were removed. At the same time the 40-mill limit bill re-

garding property taxes was placed upon the 1940 ballot as a legislative referendum measure. A general law as regards fair trade practices, as well as acts dealing with such problems in particular industries as apple growing and livestock, were passed. Ratification was extended to the federal law of May 27, 1937, to prevent speculation in lands in the Columbia basin. Since the supreme court sustained its position as to eligibility of persons for old-age assistance regardless of need, the legislature modified the state law and also barred such claims against the state based upon the old law. A commission to prepare for the Pacific Northwest Centennial exposition, scheduled for Seattle in 1942, was created.

A record number of citizens registered and voted in the 1940 elections. In the Democratic primaries a spirited contest between Gov. Martin, presenting himself for a third term, and former Sen. Clarence C. Dill resulted in the nomination of the latter. He was, however, defeated in the final election by Arthur B. Langlie (Rep.), mayor of Seattle, by a vote so close that the outcome was not determined until the count of the unusually numerous absentee ballots was made. There were five incumbents among the seven Democratic state officers elected on party tickets. Six Democrats, five re-elected, were sent to congress. President Roosevelt's popular vote for the state's 14 electoral votes exceeded that of any candidate on the state ballot, 462,145 to 322,123 for Wendell L. Willkie. The legislature in its 27th session consisted of 38 Democrats and 8 Republicans in the senate and 70 Democrats as against 29 Republicans in the assembly.

The chief officers elected for 1941 were: Arthur B. Langlie, governor; Victor A. Meyers, lieutenant governor; Mrs. Belle Reeves, secretary of state; Cliff Yelle, auditor; Otto A. Case, treasurer; Smith Troy, attorney general; Jack Taylor, commissioner of public lands; William A. Sullivan, insurance commissioner; Pearl A. Wanamaker, superintendent of public instruction.

To meet the substantially increased old-age pensions voted in Nov. 1940 the sales and use taxes were increased in 1941 from 2% to 3%, and a gift tax was enacted. Defense legislation gave the governor authority to designate defense areas, authorized the transfer of state property to the United States, protected the interests of residents who entered the armed forces and made provision for housing those engaged in defense activity. Other reactions to the crisis were an amendment to the criminal anarchy law of 1909 and the requirement that U.S. and Washington history and government be taught in the schools.

In line with the general U.S. trend toward Republicanism, three of the six congressional districts of Washington, formerly all Democratic, elected G.O.P. candidates in Nov. 1942. The perennial 40-mill limit on the taxation of real property and a measure to increase the benefits of industrial insurance were adopted by popular referendum. The supreme court sustained the state law designed to curb chain-dentistry.

The legislature in its 28th session responded in 1943 to a popular initiative petition and passed a measure authorizing public utility districts to combine and acquire electric power projects through eminent domain procedures. Opponents of the bill filed a referendum petition. The state supreme court sustained the contention that the emergency clause in the act was not valid and therefore did not militate against a referendum on the bill. The court also declared that children suspended from a school because they did not give the flag salute were not delinquent, pro-

573

viding they were not disrespectful to the national emblem. At a special session in March 1944 the legislature passed a soldiers' vote bill. In the November election, President Roosevelt carried the state by a vote of 486,774 as against 361,689 for Thomas E. Dewey. Warren G. Magnuson (Dem.) defeated Harry P. Cain (Rep.) for U.S. senator. Democrats won four of the state's six seats in the house of representatives. All state offices, likewise, fell to the party in power. The Democratic majority in both houses of the legislature reached two-thirds. State officers for 1945 were: governor, Mon G. Wallgren; lieutenant governor, Victor A. Meyers; secretary of state, Belle Reeves; treasurer, Russell M. Fluent; attorney general, Fred E. Lewis (Smith Troy on leave); superintendent of public instruction, Pearl A. Wanamaker.

In 1944 the voters adopted a constitutional amendment "limiting exclusively to highway purposes the use of motor vehicle license fees, excise taxes on motor fuels and other revenue intended for highway purposes only." Three statutory measures were rejected by the voters. Two were initiative bills which would have increased social security payments substantially. The other was a referendum bill which was designed to facilitate the formation of public utility districts. It had been submitted to the 1943 legislature by initiative petition, and although enacted into law, its operation was suspended by referendum petition.

Breaking paths for new state policies, the legislature in 1945 passed measures regulating aeronautics, authorizing the establishment of public hospital districts, declaring the ground waters of the state to be public ground waters and appropriating state funds for public libraries. Other enactments included a uniform food and drug act, a measure creating a contingent receipts fund and an appropriation of \$100,000 for the conduct of a survey of the entire public educational system. The state supreme court refused to recognize the emergency clauses in three acts of the legislature and ordered the referendum petitions submitted against them to be filed. The court also declared an act liberalizing the admission to the bar for veterans unconstitutional on the score that admission to the practice of law was a judicial function. It sustained a law which permitted county officers who served on employment statistics commissions to receive compensation in addition to their regular salaries.

During Aug. 1945 it was revealed that atomic bombs had been manufactured at the mysterious war project at Hanford on the Columbia river. Recognition that the state's school system ranked first in educational efficiency came from the National Educational association. Landowners in the Columbia basin voted overwhelmingly to share with the federal government the cost of placing the Columbia Basin Irrigation project into operation. On Sept. 23 the northwest loggers and timber workers went on strike and stayed out until Dec. 3–4. A walkout of the typographical workers of the three largest Seattle newspapers on Nov. 17 closed their plants for the rest of the year.

Despite the largest registration of voters in the state's history, the numbers of votes cast at the primary and general elections of 1946 were far below those of 1944. Harry P. Cain, Republican, defeated Hugh B. Mitchell, Democrat, for the senate by a vote of 358,847 to 298,683. The Republicans elected five of the state's six congressmen. The voters rejected one initiative measure and two referendum measures. The initiative measure, upon which the two largest utility companies in the state took opposite views, would have required the approval of voters in utility

districts "as a prerequisite to acquisition of any operating electrical utility properties." One referendum was intended to make the state game commission responsible to the governor; the other was to create a state timber resources board. An amendment to the state constitution "to permit the state to tax the United States and its instrumentalities to the extent that the laws of the United States will allow" was ratified by the electorate. (H. J. DE.; X.)

Washington, D.C.

By 1945 the total land area of the District of Columbia was 61 sq.mi. and the population was 926,260 (1940 census 663,091). In 1922 the federal government had contributed 40% of the budget for the government of the District of Columbia; by 1945 this had decreased to 9.45%. During the decade 1937–46 congress contributed \$6,000,000 each year; but, as the budget inevitably increased, this amount became a progressively smaller proportion of the total expenses. In 1946, for the 1947 budget, the senate voted to contribute \$10,000,000 and in conference the amount agreed upon was \$8,000,000.

The District of Columbia continued to be governed by a commission of three, two residents of the district appointed by the president and a third officer from the U.S. army engineering corps nominated by the chief of engineers.

A revised master plan had been prepared by the national capital park and planning commission, based largely on the plan of 1901, which in turn revived the essential features of the original L'Enfant plan by which the city was laid out for its first occupation in 1800.

The war years 1941-45 brought dislocation of the population and violence to the master plan of Washington. Government activities expanded so rapidly that many private buildings were rented and apartment houses were taken over for offices, only to leave shortages in housing units even more acute. The public mall was studded with temporary buildings for offices and dormitories. New public and private buildings were often located without regard to the plan.

Before World War II, the Alley Dwelling authority had cleared out certain inhabited alleys and built nearly 2,500 housing units. During the war 57.537 dwelling units were erected by private enterprise and 8,493 by public agencies in addition to 9,048 dormitories.

The nation's capital, besides being served by the national capital park and planning commission, was also fortunate in having the Commission of Fine Arts, established by congress in 1910, which continued to function as the guardian of the art, architectural and landscape development of the capital. In 1944 the chairman, Gilmore D. Clarke, explained that the commission had not approved the abandonment of the city's classical background and had continued to stress attributes of architecture of the past. The Fine Arts commission, in addition to authorization of the original act of congress and a series of executive orders, was also aided by the Shipstead-Luce act of 1930, under which the commission was to exercise an effective control over the design of all buildings erected on private property opposite designated public buildings and grounds.

After 1922–23, the American Planning and Civic association had an active Committee of One Hundred on the Federal City, under the chairmanship (until 1940) of Frederic A. Delano, who was succeeded by Associate Justice Owen J. Roberts of the supreme court and in 1945 by Clifton Woodrum, a member of congress from Virginia. In 1940 the committee sponsored a dinner at which the first report of the committee in 1924 was examined and compared with accomplishments in the succeeding 16 years. The first task of the committee had been to secure legislation for the national capital park and planning commission. The result was the legislation of 1924 authorizing park

purchase, supplemented by the Capper-Cramton act of 1930, and the legislation of 1926 setting up the commission. This legislation was sponsored jointly by the Civic association working with leaders in the American Institute of Architecture, the American Society of Landscape Architecture, the American Institute of Planners, the American Society of Civil Engineers, the Garden Club of America and others.

In 1940 it was reported that the acquisition of 70% of the park system, as planned by the commission, had been completed, with an expenditure of 52% of the funds authorized. During this period, also, the Civil War forts surrounding the city had been acquired, and work was begun on the connecting parkway. The Mount Vernon Memorial highway was completed, and the Chesapeake and Ohio canal was acquired for recreational purposes. Schools and schoolgrounds were located in accordance with the plan, and a number of joint school and recreational centres were established.

The Washington Zoning act, originally adopted in 1920 and modernized by congress in 1938, continued to maintain a comparatively low skyline and to prohibit skyscrapers which might dominate the dome of the capitol and the Washington Monument.

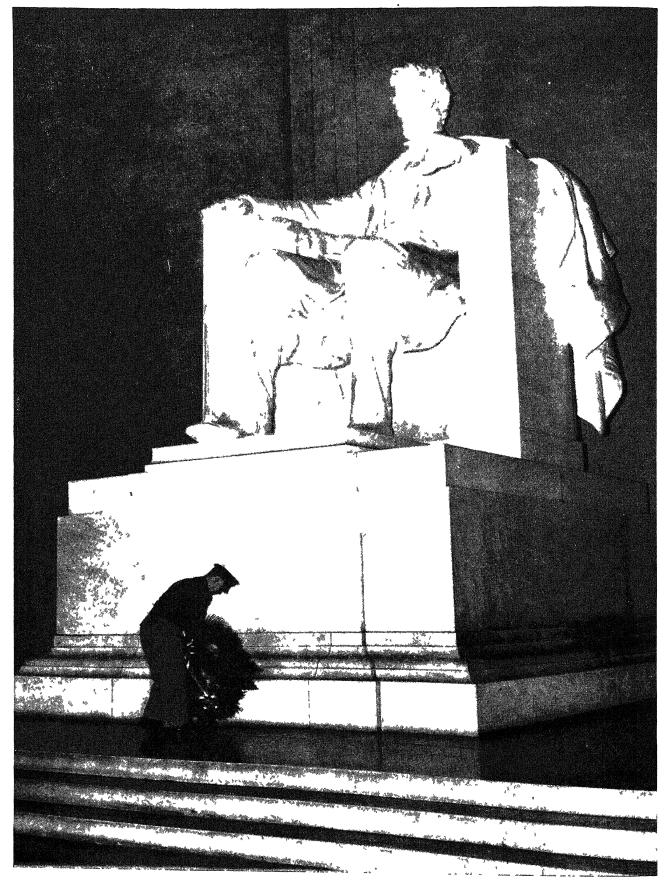

In 1940 the Committee of One Hundred on the Federal City announced a new program, which, however, was soon to be interrupted by World War II.

Realizing the importance of the problems facing the federal city and the interest of the U.S. people in their capital, a joint committee on the national capital was set up in 1943, consisting of representatives of ten national organizations: American Federation of Arts, American Institute of Architects, American Institute of Planners, American Planning and Civic association, American Society of Civil Engineers, American Society of Landscape Architects, the Garden Club of America, National Association of Real Estate Boards, National Sculpture society, and National Society of Mural Painters. This committee was not to act as a unit on pending matters but was to secure data and make recommendations to the constituent organizations so that they might be in a position to act intelligently.

In the early 1940s a citizens' council for community planning brought together most of the local organizations interested in planning and housing in Washington.

During the decade 1937–46 several controversies developed concerning the character of the federal city. In 1986 congress had directed the corps of engineers of the U.S. army to make studies of the river basins of the country in order to develop plans for flood control. The reports of the division and district engineers not only recommended flood-control measures but proposed extensive power development along many miles of the Potomac river, involving the destruction of large aesthetic and economic values. In the 1920s, proposals to develop power on the Potomac by private companies had been defeated in congress. The proposal of the 1940s was to develop public power, but the physical works were similar. At the hearings before the board of engineers for rivers and harbours in April 1945, there was unanimous expression of opinion against the proposal, and consequently the board made an adverse report on the proposals for power on the Potomac.

This was a recognition of the residential and monumental character of the federal city, which, apparently, the U.S. people wished to protect from unrelated industrial development, at the same time preserving the features of natural beauty which had made the city famous.

In 1946 another controversy developed over plans to erect large extensions to the White House to be used for office buildings. This brought to public attention the proposals growing out of the Senate Park report of 1901 that the office wings erected in the White House grounds be considered temporary until such time as a proper site could be secured for permanent executive offices, even then rapidly outgrowing space in the White House. The Committee of One Hundred on the Federal City and the D.C. chapter of the American Institute of Architects circulated accurate information, with the result that most of the important newspapers in the country presented articles and editorials against further encroachments on the White House grounds. Congress withdrew its appropriation for new building, and the national capital park and planning commission was committed to a restudy of the entire White House area in order to develop a detailed plan for permanent development.

In 1946 the Urban Redevelopment and Housing bill was passed by congress, after several years of bitter controversy, to set in motion plans for redevelopment of blighted areas in the federal city.

Still another controversy concerned the building of new bridges across the Potomac. The proposed location and plans of the District of Columbia highway engineer's office failed to receive the approval of the national capital park and planning commission as conforming to the master plan, and, according to the commission, focused too large a volume of traffic on the already overcrowded business district.

In Jan. 1944 the bureau of the budget made a report to the president, at his request, recommending certain measures to strengthen the powers of the national capital park and planning commission, but the confusion of World War II and its aftermath prevented the action of congress on these important recommendations.

Water Power

Water-power development in the decade 1937–46 proceeded on the largest scale in history. U.S. Federal Power commission reports showed that ten years' increase in hydroelectric generating capacity was approximately 4,800,000 kilowatts—from 10,037,165 in 1936 to 14,839,744 in 1946—a growth of 47.3%. Boulder, Grand Coulee, Bonne-

Gen. Dwight D. Eisenhower placing a wreath at the Lincoln Memorial in Washington, D.C., on Feb. 12, 1946, to commemorate the 137th anniversary of the president's birth

ville, the Tennessee Valley authority dams and other large federally-constructed projects accounted for most of this increase. Privately-owned hydroelectric utility plants increased only 4.4%—from 8,494,068 to 8,867,290 kw.—while publicly-owned water-power installations mounted from 1,543,097 to 6,044,327 kw., or 292%.

Steam and other fuel plants still produced nearly 70% of the U.S. electric energy, although in 1945, owing to favourable water conditions, water power produced 37% of the total. But the amount produced by water power rapidly increased. Hydro production for public use in 1936 was only 39,057,647,000 kw.hr. In 1945 it reached 79,970,312,000 kw.hr., an increase of 105%. Publicly-owned hydro plants in the same period increased their output from 3,894,756,000 to 32,710,897,000 kw.hr., or 740%. Privately-owned plants still generated more than 80% of the country's total energy requirements and an even larger percentage when the output of industrial plants was included.

The Boulder dam project on the Colorado river was the largest U.S. power plant at the end of the decade. With more than 1,000,000 kw. of generating capacity, its vast output was transmitted 270 mi. to Los Angeles, Calif, supplying the electric needs of southern California. Columbia river developments made the Pacific northwest the greatest of power-producing areas. Bonneville (522,400 kw.) began operations in 1933, followed in 1941 by Grand Coulee (743,000 kw. installed) which, with its ultimate installation of 1,964,000 kw., was to be the largest in the United States. Beginning with Norris (100,800 kw.) and Wheeler (129,600 kw.) completed in 1936, the Tennessee Valley authority constructed some 14 major dams, including Pickwick (144,000 kw), Watts Bar (150,000 kw), Fontana (135,000 kw.), Kentucky (96,000 kw.), Chickamauga (81,000 kw.), Apalachia (75,000 kw.), Guntersville (72,900 kw.), Fort Loudoun (64,000 kw.), Cherokee (60,000 kw.), Douglas (60,000 kw.) and Hiwassee (57,000 kw.). With Wilson dam (335,200 kw.) at Muscle Shoals, 6 steam plants, and hydro projects acquired or TVA-operated, the Tennessee Valley authority system by 1946 had a total installed capacity of 2,500,000 kw. producing more than 12,000,000,ooo kw.hr. a year-the largest output of any integrated system in the world.

Other large hydroelectric projects constructed were Grand river dam in Oklahoma (72,400 kw.), and Denison dam on the Red river in Texas (71,000 kw.) which were to be connected by Southwestern Power administration transmission lines with Norfolk dam (ultimate capacity 70,000 kw.), under construction at the end of 1946 on the White river in Arkansas. In Texas, the Lower Colorado River authority built a series of dams developing more than 117,000 kw. constituting an integrated system, and the Brazos river project (22,500 kw) was completed. Santee Cooper (132,615 kw.), constructed with federal funds by the South Carolina Power authority, was the largest new plant completed in the southeast. In Montana, on the upper Missouri river, army engineers built Fort Peck dam, with incidental power capacity of 50,000 kw. Nebraska, developing its water resources through the Loup river, Platte valley and Central Nebraska Public power districts, became, with the purchase of the Nebraska Power company by the city of Omaha, the first public-power state.

Largest of all projects under construction at the end of 1946 was the Central Valley project in California, where Shasta dam (154,000 kw. installed) was to have an ultimate installation of 379,000 kw., to be followed by Keswick (75,-

ooo kw.) and other dams utilizing the Sacramento river and other waters for irrigation and power. Parker dam, on the Colorado river in California, was completed (120,000 kw. installed) and Davis dam on the Arizona-Nevada border was under construction, designed for an ultimate capacity of 225,000 kw.

Hydroelectric projects authorized by congress, but awaiting appropriations for construction in 1946, included Clark Hill on the Savannah river in Georgia and South Carolina, designed for 200,000 kw.; Bugg's Island on the Roanoke river (Virginia and North Carolina), 204,000 kw.; Wolf Creek on the Cumberland river in Kentucky, 270,000 kw.; Bull Shoals on the White river in Arkansas, 336,000 kw. and Blakely on the Ouachita river, 63,000 kw. Georgia's capacity was to be increased 108,000 kw. by construction of the Allatoona dam on the Etowah river.

Missouri river projects authorized included Garrison dam in North Dakota, 320,000 kw., and Fort Randall dam in South Dakota, 400,000 kw. In the Columbia river basin, Montana was to get 150,000 kw. by construction of Hungry-Horse dam, while development of the Umatilla (McNary) dam was to give Oregon its largest hydro plant, 690,000 kw.

River basin development by multipurpose projects providing for flood control, irrigation, navigation, power, water supply, soil conservation, reforestation and recreation was rapidly superseding the wasteful, piecemeal single-purpose undertakings. Regional programs covering entire drainage areas could stimulate local enterprise and promote every element of the region's economy.

Power remained the principal money earner in such programs.

The Tennessee Valley authority furnished the best example of unified multipurpose development. With an electric system of 2,500,000 kw., selling power to 92 municipalities and 46 co-operatives and serving 650,000 homes, farms, stores and factories in 7 states, its 26 dams assured effective flood control. Nine-foot navigation was provided for a distance of 650 mi., through a series of pools connected by locks, extending from Knoxville, Tenn., to Paducah, Ky. Farming and forestry were fostered, many new local industries were established and the large lakes made by its reservoirs created a new recreation area, with 115,000 ac. of game or wildlife areas and 55,000 ac. of public parks.

Considered from an over-all regional standpoint, the undeveloped water-power resources of the United States were still immense. The Federal Power commission's roster of river basin projects studied and found favourable for multipurpose development offered the possibility of ultimately increasing the nation's hydroelectric generating capacity to 100,000,000 kw., with an annual output of more than 500,000,000,000 kw.hr.—nearly twice as much electric energy as the entire country used for all purposes in 1946.

By far the largest proportion of undeveloped U.S. water power was in the Pacific and Rocky mountain states. As compared with their total of about 9,000,000 kw. of hydro and steam electric power in 1946, their rivers, principally the Columbia river and its tributaries, offered the possibility of an additional 50,000,000 kw., producing annually 300,000,000,000 kw.hr. From the streams which drain the Missouri-Mississippi basin and their tributaries, rivers in New Mexico, Texas, Colorado, Oklahoma, Kansas, Missouri, Arkansas and Louisiana, the nation could expect projects producing 120,000,000,000 kw.hr. and from the east and south coasts, on rivers which drain into the Atlantic ocean and the east coast of the Gulf of Mexico, addi-

tional production of approximately 80,000,000,000 kw.hr.

These estimates looked to the distant future when the United States would require many times the electric energy that its people and industries used at the end of the decade 1937-46. But there were many important sites calling for early development. Most outstanding, perhaps, was the St. Lawrence seaway and power project. An agreement between the governments of the United States and Canada for joint development of the water in the Great Lakes-St. Lawrence river basin for navigation and power was signed March 19, 1941. The agreement provided for a power development in the International Rapids section of 1,650, 000 kw., or 875,000 kw. apiece for the two countries, and contemplated an almost equal amount of additional power through the redevelopment of the Niagara viver. St. Lawrence power, to the extent of 6,500,000,000 kw.hr. a year, could be generated and delivered throughout New York state and New England at an average cost of about 2.2 mills.

Power transmission over longer distances would greatly increase hydroelectric service areas. Maximum transmission in the United States in 1946 was approximately 300 mi. at 287,000 volts, the longest line in operation running from Boulder dam to Los Angeles.

Engineers were studying plans developed in Germany to transmit electric energy up to 500 mi. over lines carrying 400,000 volts.

Power grids, connecting the generating and distribution facilities of entire systems and areas, were coming into use. Through the Tennessee Valley authority, publicly and privately-owned systems from Ohio to the Gulf were linked by connections which relieved the wartime power shortage in the south. A power pool which connected public and private systems aided substantially in meeting Pacific northwest war power demands. Grids proved successful in various regions.

Forward-looking engineers expected some day to see all the hydro developments and steam generating plants in the Pacific and mountain states, from Canada to California, Utah and Colorado, linked together in the largest power pool the world had ever seen. Wavell of Cyrenaica and Winchester

Viscount Wavell (Archibald Percival Wavell) (1883–), British army officer, was born May 5, 1883. He was educated at Winchester college and the Royal Military college, Sandhurst, and joined the Black Watch regiment in 1901. His career thereafter was both variegated and adventuresome. He fought in the South African-War (1901–02), in India's northwest frontier (1908) and in France during the first part of World War I (1914–16), in which he suffered the loss of his left eye. In 1916, he served as military attaché with Russian armies in the Caucasus and was transferred to Palestine in 1917. Following the end of World War I, Wavell was made commander of a brigade and later a division at Aldershot. In 1936, he went to the soviet union as a military attaché; the following year, he was dispatched to Palestine and Trans-Jordan,

Viscount Wavell (second from left) chatting with Mohammed Ali Jinnah (third from right) and other leaders of the All-India Moslem league who attended the conference at Simla in June 1945

but returned to England in 1938 to head the southern command.

With war impending, Wavell was made commander of British armies in the middle east in the summer of 1939. Wavell's small force of British imperial troops fell back before Marshal Graziani's attack, launched Sept. 12, 1940, and retreated beyond Sidi Barrani in Egypt. On the night of Dec. 8–9, 1940, Wavell opened a lightning counterattack, sweeping the Italians out of Cyrenaica and driving them all the way back to El Agheila west of the Libyan hump by Feb. 10, 1941.

Marshal Rommel, who replaced Graziani at the head of the axis forces, counterattacked on March 25, 1941, forcing Wavell to relinquish the gains he had won at Graziani's expense.

Wavell also directed the successful Allied operations in East Africa, in Iraq and (in part) in Syria, but suffered serious defeats at the hands of the Germans in Greece and Crete.

On July 1, 1941, Wavell was transferred to the post of commander of British forces in India and the following month, he headed British forces in the joint British-soviet campaign in Iran. After the Japanese attack on Britain and the U.S. in Dec. 1941, he was named supreme commander of Allied forces in the far east on Jan. 3, 1942; the following March he returned to his former position as commander of British forces in India and, additionally, Burma. Promoted to the rank of field marshal on Jan. 1, 1943, he was appointed viceroy of India on June 19 of that year and the following July he was elevated to the peerage as Viscount Wavell of Cyrenaica and Winchester.

Wealth and Income, Distribution of

Although there had been very great interest in this subject and wide recognition of its importance, no entirely satisfactory study of the size distribution of the income in the U.S. had been made up to the end of the decade 1937–46. All the available studies suffered to some extent from a lack of basic information, and in addition the numerous technical difficulties in the field contained many unsolved problems. Nonetheless, considerable progress was made during the decade, and various studies became available which provided much useful information, even though their results had to be considered more or less tentative.

Stimulus to research in the distribution of income was given by the publication in 1934 of a study made by the Brookings institute, entitled America's Capacity to Consume. This study examined the distribution of income for the year 1929 and found that there was a high degree of inequality even in that year of national prosperity. Out of the 36,462,000 spending units in the U.S. in 1929, it was estimated that 27% were in the income group of less than \$1,000 and received only 5.2% of total income. Furthermore, 55% of the income units were in a group with earnings less than \$2,000 and received only 27.1% of total income. The proportion of families earning under \$3,000 was 72% and this large group accounted for but 42.9% of total income. On the other hand, the remaining 28% of families received 57.1% of total income.

The most comprehensive study of the distribution of income was that issued by the National Resources committee. It provided a wide variety of data on both the distribution of income and the distribution of expenditures for the year 1935–36. Three reports were published: Consumer Incomes in the United States, Consumer Expenditures in the United States and Family Expenditures in the United States. These studies were based upon income data for about 300,000 consuming units, augmented by income tax information for the high income groups, and expenditures data for about 60,000 consuming units. Summary data from this study are given in Tables I and II.

The relatively high degree of concentration of income is evident from the data in Table I. It may be calculated that the average income per consumer unit for the year 1935-36, that obtained by dividing the aggregate income by the total number of consumer units, was \$1,502. Yet half of the consumer units had incomes of less than \$1,070 because of the large incomes received by a relatively small number of consumer units at the upper end of the income scale. The largest number of consumer units was in the group receiving incomes from \$500 to \$1,000. This group contained almost 30% of all consumer units and received a little less than 15% of aggregate income. Slightly more than 17% of the consumer units received income of less than \$500 and, as a group, received less than 31/2% of aggregate income. At the upper end of the income scale it may be noted that the number of individuals included in the various groups fell off sharply after the \$3,000 level was reached. Altogether, less than 7% of the consumer units had incomes of more than \$3,000. This group received more than 30% of total income.

The disparity of incomes was strikingly revealed by grouping the total number of consumer units by tenths. The poorest tenth of the consumer units received incomes up to \$340 and in the aggregate accounted for less than 2% of total income. The second tenth had incomes range-

ing from \$340 to \$545 and received 3% of the total. On the other hand, the tenth of consumer units with the highest incomes included those receiving \$2,600 and more and in the aggregate accounted for 36% of the total income. This highest tenth received about the same total income as the 70% at the bottom of the income scale.

As much public discussion had been concerned with the lower third of the population, it was interesting to compare the size distribution of income on the basis of the three thirds of consumer units. Each of these thirds contained 13,000,000 families and single individuals.

During 1935-36 the lower third of the nation received incomes of less than \$780, with an average income for the group of \$471. The share of the aggregate income received by this lower third of the nation was just more than 10% of the total of \$59,000,000,000. It should not be thought that these 13,000,000 families and single individuals constituted a distinct and unusual group. All types of consumer units, from single individuals to large families, were included in the group; they lived in all types of communities; and they worked in all the major types of occupations. Apart from receiving less income, they differed from the other two thirds of the nation principally in that a larger proportion received relief for some part of the year; a larger number lived on farms and a smaller number had occupations in the professional, business and clerical fields. Although the proportion receiving relief in this group for some part of the year was relatively large, it was not essentially a group dependent upon relief, since 70% of the total number were completely nonrelief families and individuals.

In the middle third of the nation were the 13,000,000 consumer units receiving from \$780 to \$1,450 during the year. They had an average income of \$1,076. As contrasted with the lower third, only 13% were at all dependent upon relief; twice as many lived in large cities and twice as many worked at professional, business and clerical occupations.

The upper third of the consumer units contained all those with incomes of more than \$1,450. In total, this group received about two-thirds of the aggregate income

of all consumer units.

In interpreting the above data on the distribution of income, it should be kept in mind that the figures refer to dollar income. As the cost of living and the mode of living differed widely from community to community, the dollar incomes did not accurately measure the differences in real income or economic well-being.

It may be seen in Table I that more than two-thirds of the nation's consumer units spent considerably more than their aggregate income in 1935-36 for all purposes. In other words, as a group they had negative savings. The proportion of savings to aggregate income became relatively large with those receiving more than \$5,000 during the year and in the income group of more than \$20,000 approximately half of the aggregate income was saved.

The average expenditures of each third of the nation for various categories of consumption are shown in Table II. These data reveal the very high proportion of income expended on the necessities of life by the lower third of the nation, as well as the low dollar expenditure totals of this group. Almost 75% of its income went for food and housing, and the addition of household operation and clothing brought this to more than 95%. On the other hand, the upper third of the nation spent only a little more than 50% of its income for these purposes.

During the years of World War II two surveys of the distribution of U.S. income were made on the basis of a small sample of spending units, which were illuminating in showing the tremendous shift in the distribution of income that occurred under conditions of economic prosperity. The first of these studies covered the year 1941 and was made by the bureau of labour statistics, and the bureau of home economics. At the end of World War II, a survey covering the year 1945 was made by the bureau of agricultural economics, for the board of governors of the federal reserve system. This survey was entitled National Survey of Liquid Asset Holdings, Spending and Saving.

A comparison of the distribution of income during World War II with that of 1935–36 is shown in Table III. The most striking result of the expansion of total income which occurred during the period of wartime prosperity was to move family units out of the small income classes. By 1945 the family units were much more evenly distributed among the income classes than was the case in either 1941 or 1935–36. At the beginning of the decade 1937–46, more than 50% of the units had annual incomes of under \$1,000, while by 1941 only 35% of the units were in this income class. By 1945 only 20% of the units were in the group earning under \$1,000. This change was a reflection of not only the increase in average incomes during this period but also of the virtual elimination of unemployment in 1945 as compared with 1935–36.

groups.

Traces shown here include only personal income taxes, poll taxes and certain
personal property taxes.

The income groups receiving \$2,000 or more showed the largest increases in the proportion of spending units over this ten-year period. Only 16% of the spending units were in this income group in 1935-36. However, by 1941 35% of the spending units had incomes of more than \$2,000, and this percentage had risen to 53 in 1945. It may be noted that the greatest gain occurred in the \$3,000 to \$5,000 income group which had more than 20% of the spending units in 1945 as compared with 4% ten years earlier.

Inasmuch as the rise in incomes had the effect of shifting family units out of the smaller income groups, the families

remaining in those groups received a much smaller proportion of the total income in 1945 than they did in 1935-36. For example, the spending units with incomes of less than \$2,000 received 20% of total income in 1945, while the much larger number of units in this income class received 30% of total income in 1941 and 53% in 1935-36. This did not mean that the low income families failed to participate in the increase in income but rather that, by participating in the increase in income, they had been shifted out of the low income category.

In a period like the decade 1937-46, the vast changes in the cost of living and tax liabilities must be kept in mind in analyzing data on the distribution of income. In cautioning about these difficulties, the bureau of agricultural economics stated the following in its report: "In interpreting these shifts between income classes, it should be realized that income refers to money income received and does not take into account price and tax changes that have occurred during the war years. The Consumers' Price Index of the Bureau of Labor Statistics shows prices in 1941 to be about 7 percent higher than prices prevailing in 1935-36, and prices in 1945 to be roughly 30 percent higher. Because of these substantial price rises, a spending unit which was shifted from the under \$1,000 income group to the \$1,000 to \$2,000 income group may not have materially improved its buying power or financial position. Furthermore, taxes increased substantially during the war. This increased tax burden undoubtedly affected the spending habits of some lower income groups and to an even greater extent affected total saving, particularly of the highest income brackets."

U.S. State Distribution of Income.—Statistics on the geographic distribution of income in the U.S. continued to be published annually by the U.S. department of commerce. A summary of these statistics for the years 1937-45

*Per capita income payments are derived by division of total income payments by total population, excluding federal civilian and military personnel stationed outside the continental United States.

Source: U.S. department of commerce.

is shown in Table IV. The tremendous variations in the income of the various states may be seen from these data, the range in the prewar year of 1937 being from \$77,000,000 in Nevada to \$11,635,000,000 for the state of New York. The major factor behind these variations was, of course, the large differences in the population of the various states. The heavily populated states like New York, Pennsylvania, Illinois, Massachusetts, California, Michigan and Ohio were the states with the larger total income. Hence, from the standpoint of revealing differences in the standard of living from area to area, the per capita income data shown in Table V is more meaningful.

Even on a per capita basis, the differences in income among the various states were very substantial. In the prewar year of 1937 these differences ranged from \$207 per capita in Mississippi to \$1,107 in the District of Columbia. The southeastern region of the nation had the lowest per capita income average in the country with \$310, and the southwest region with \$397 was well below the national average of \$561. On the other hand, New England, the middle eastern states and the far west region with per capita incomes of \$704, \$740, and \$714 were significantly above the national average.

The major factor explaining these differentials in income was the variation in the industrial structure of the states. This is brought out by the information in Table VI, which shows the industrial distribution of the employed labour

force for the states with per capita incomes less' and more than the national average. It can be seen that the high-income states generally had a larger proportion of the labour force in manufacturing, mining, construction and the distributive and service industries and a smaller proportion in agriculture and domestic services. In the low-income states, on the other hand, these proportions were generally reversed. For example, the low average income in the southeastern region was explained primarily by the large dependence upon agriculture and domestic services as a source of income in that area. Approximately two-fifths of the persons employed by private industry in the region were in agriculture, while in the rest of the country this industry accounted for only one-seventh of total employment. Furthermore, the states in this region had relatively fewer workers in the manufacturing, distributive and service industries, where earnings were much higher than in agriculture and domestic services.

There were, of course, other factors accounting for

the low income level in the south. For example, average farm income in the region was substantially lower than in other areas of the country, and the south was still a low wage area. It was significant, too, that the south had a greater proportion of manufacturing industries which had been traditionally low wage industries.

A tremendous expansion of income which occurred after 1940 lifted the per capita income of the country to a record high level. From 1940 to 1945, the per capita income of the nation as a whole doubled, rising from \$575 to \$1,150. All areas of the country participated in this expansion, though they did so in unequal proportions. There was a general tendency for the differences in per capita income to be narrowed during the years of World War II, with the lower income states gaining relatively to the higher income areas. This tendency had been in evidence during the '30s, but the changes in this direction were accelerated as income expanded under the stimulus of government war spending. The characteristics of the expansion in the various regions and the extent to which the pattern of change differed from prewar trends can be brought out by analyzing the income changes in the various regions.

Over the period 1933-45, there was a continuous decline in New England's proportionate share of total income payments. The relative decline was small up to 1940 but was sharply accelerated in the subsequent period. For all of the New England states, the gains in total income

*Include trade, transportation, public utilities, finance and service (except domestic). †A state is classified as high income or low income according to whether its per capita income of civilians in 1944 was more or less than the national average. States are ranked by size of 1944 per capita civilian income.

Source: U.S. department of commerce.

from 1940 to 1945 were less than the national average. The rate of income expansion in Connecticut, however, was greater than the national average in 1940–42 because of the fact that the rearmament program greatly stimulated income in this highly industrialized state.

The middle east region likewise received a smaller share of the nation's income payments in both the prewar and war periods. The small prewar decline was attributable to the fact that New York, Pennsylvania and the other states in the region had higher proportions of the total in 1940 than in 1929. As in the case of New England, the proportionate decline was accelerated during World War II when every state in the region had an increase in income that was lower than the national average. In the early war period, the large expansion of the aircraft and shipbuilding industries in Maryland produced a larger than average increase in income of that state, but this trend was reversed in 1944-45 as the growth of these industries levelled off and declined. On the other hand, the proportionate increase of income in New York turned upward in 1944-45 for the first time since 1938. This was because of the fact that the great diversification of industry in New York made that state less vulnerable to the decline in war production.

The states of the southeast region experienced gains during World War II that were substantially higher than the national average. In fact, the rise in total income was larger in the southeast than in any other region of the country. This trend was a continuation of prewar developments. In 1940 income payments in the southeast region were 4% higher than in 1929 as against a decline of 10% for all other areas of the nation. It reflected largely the expansion of manufacturing activity in the south, where factory pay rolls were 12% higher than in 1929 as compared with a drop of 7% for the other regions. During World War II, factory pay rolls in the southeastern states continued to expand more rapidly than for the nation as a whole, and, in addition, the large volume of military payments in this area contributed to its greater rise of income payments.

The states of the southwestern region also increased their share of total income payments in both the prewar and wartime periods, though their relative wartime gain did not begin until 1942. As in the southeast, military payments were an important source of income expansion during World War II. But this factor did not determine the trend as there was a substantial expansion of war production in the area. Factory pay rolls by the end of 1945 were one and a half times the 1940 total, the largest increase of manufacturing pay rolls in the country.

Income payments in the central states region moved approximately in proportion to the national totals. For example, the region showed a decline of 11% during 1929-40 as compared with an 8% decline for the nation as a whole, while from 1940-45 income payments expanded 97% in the region and 101% in the nation. The relative change in income of the various states in the region did not move similarly throughout this period. Up until 1943 Illinois gained less rapidly while Michigan and Indiana experienced rising income shares. In 1944 and 1945, however, Illinois gained relative to the other two states. As the central states region included highly industrialized as well as agricultural areas, the expansion of war industries and agriculture were the primary sources of its increased income during World War II. Military payments were less important than in any other area in their contribution to the expansion of income.

The northwest region was a conspicuous exception to other regions in that the relative movement of income during World War II was not in accordance with prewar trends. The region experienced a larger than average rise in income during the war in contrast to its relative loss in income in 1929-40. The experience of agriculture largely accounted for this difference. In the prewar period, the severe loss of farm income in Kansas, Nebraska, North Dakota and South Dakota affected the income of the region adversely. During 1939-43, however, farm income in the northwest tripled, with the result that the region made record gains in income payments.

The large expansion of war industry in the far west contributed to an increase in income of 144% from 1940-44, in contrast to a rise of 97% for the nation. This rapid advance during World War II continued at an accelerated rate the relative gains made by the region during 1929-40. In the earlier period, too, the growth of the industrialization was the primary factor explaining the trend. By 1940 the factory pay rolls of the far west region were 7% higher than the 1929, while for the entire nation there was a 6% decline over this period.

An important result of these diverse trends during World War II was to narrow the differentials among the states and regions in per capita income. The reduction in geo-.

graphic inequality can be seen by the changes during the period 1940–45 in the relationship of regional per capita incomes to national per capita income. Per capita income in New England and the middle eastern states declined as a percentage of the national average over this period. On the other hand, in regions with low income such as the southeast, southwest and northwest, the per capita incomes rose by much more than the national average. The experience on a state basis was similar. In 1940 there were 17 states with per capita incomes higher than the national average. The gains of 14 of these states were less than the national average during 1940–45. On the other hand, out of the 32 states with per capita incomes below the national average, 28 experienced wartime increases that were greater than the national average. (M. GT.)

Great Britain.-On distribution of income and wealth in the period immediately preceding World War II, facts were more complete for the United Kingdom than for any other country. British income tax continued to be a tax on personal income where the size of the income must be ascertained for administrative purposes. Also the definition of income for income tax purposes agreed on the whole with the economist's definition, and an efficient administration left little scope for evasion of assessment. Hence income tax returns provided the statistical raw material for calculating the distribution of income in the United Kingdom. By 1937 some 10,000,000 incomes out of an estimated total of 25,000,000 (including the incomes of recipients of unemployment benefit, sickness benefit, pensions for old age and widows and orphans) were above the income tax exemption limit, and this figure rose temporarily to 15,000,000 during World War II. It was the larger incomes which were assessed, which meant that about 70% of the total private income distributed to persons was brought into assessment.

Until a study of tax returns for 1938 was made, no official figures on income distribution extracted from in-

come tax data had been published since those for 1919. These figures were completed for the lower ranges of income by using national income estimates published in 1942. Later annual estimates of the distribution of private income were published by the Central Statistical office in the White Papers, called National Income and Expenditure of the United Kingdom, and issued annually in April. There was a necessary time lag between the year to which the figures referred and the date of publication. The distribution for 1944 is given in Table VIII in comparison with the distribution for 1938. Figures for 1944 were subject to revision.

In interpreting Table VIII it should be borne in mind that the bulk of the income not assessed as the income of individuals consisted of the income of companies not paid out to shareholders but paid in company taxation or

Source: National Income and Expenditure of the United Kingdom, 1938-45 (Cmd. 6,784, 1946), except for figures in brackets which are approximate estimates. Notes.—Incomes from national insurance and assistance benefits are included in the range below £250. Unallocated income includes the undistributed profits of companies, liabilities for national defense contribution and excess profits tax, the income from investment of nonprofit-making bodies and assurance funds and other income that cannot be allocated to different ranges.

put into general reserves.

These incomes were properly attributable to the higher income brackets where shareholders could usually be found.

The main drawback of the estimates in Table VIII lies in the absence of reliable information on the distribution of income less than £250, which was regarded as the upper limit of working class income in 1938. At that date over four-fifths of British families fell into that class—less than the proportion indicated by Table VIII, as the average number of earners per family was greater in the lower than in the higher ranges of income. Income tax statistics did not cover most of the lower ranges and statistics of wages referred to averages for groups without disclosing individual variation. As there was, in spite of standardized wage rates, great variation in annual earnings because of unemployment, sickness and similar factors, it was very difficult to dovetail statistics of wages into income tax data.

It should be mentioned that the incomes of man and wife were assessed as a single income. For the ranges above £250 the concept "number of incomes" should be interpreted in this sense. For most families in the higher ranges this represented the family income; the distribution of incomes under f_{250} could to some extent be obtained from sample studies of family income, as was done in the U.S.A. No such study existed for the United Kingdom as a whole but some information was obtainable for selected towns, for instance. York, from social surveys carried out in the years preceding 1939. Valuable information might also be forthcoming from the official family budget inquiry carried out in 1937-38 the results of which were not analyzed during World War II. On the other hand, detailed annual information existed for incomes of more than £2,000. These incomes were subject to surtax. The figures obtained from the administration of this tax appeared in the annual inland revenue reports.

The information disclosed by Table VIII, it should be remembered, referred to incomes before tax. The distribution for 1938 compared with that for 1919 as far as the two distributions were comparable showed little change. The wartime distribution for 1944 showed, on the face of it, certain changes, notably a tendency toward a more equal distribution of income. However, if allowance was made for changes in the price level and for the fact that the income not allocated to the different ranges was properly attributed to the higher ranges of income, the change from 1938 to 1944 was very small. It could be said that no statistically significant change was exhibited during World War II in the distribution of income; but the distribution of incomes available for disposal by individuals became distinctly more equal during World War II, primarily because of the operation of the excess profits tax and higher income tax. Some of the effects of wartime taxation were likely to be retained.

As the administration of the United Kingdom income tax supplied the data for a distribution of incomes, so the administration of estate duties yielded information on the distribution of capital owned by persons. Since 1894 estate duties had been payable on estates valued over £100 at the death of the owner. In 1946 the exemption limit was raised to £2,000. At death a valuation of the estate was made for tax purposes; this valuation was on the whole satisfactory from the economist's point of view, and little scope was left for evasion. For certain years the annual inland revenue reports published tables showing the number of estates and the amount of estates "falling in" at death, classified both according to size and according to sex and age of the owner. Assuming that the persons dying in a particular year (or during, say, three years) represented a fair sample of their respective sex and age groups, a distribution of capital owned by persons could be obtained by dividing the mortality rate of sex and age groups into the number of estates or into the amount of estates left at death by persons in that group. To obtain more accurate results, mortality rates for the higher occupational classes and not general mortality rates were used.

Publication of the basic tables required for these estimations was suspended during the early '30s but was resumed for England and Wales for 1936 and 1938. No such tables were published for the years of World War II. The only figures relating to Scotland were published for 1938, and these were not sufficiently complete. H. Campion, following his previous work carried out in conjunction with Professor G. W. Daniels, published in 1939 distributions for 1936, together with comparable figures for earlier years. Although in 1936 all except 5% of the total capital in personal ownership was above the estate duty exemption limit, it was very difficult to relate the number of estates in that class to the total in the country. The reason was that the ownership of estates by women and minors was common among the rich and hence it was not possible to estimate the number of families which were in the ownership of 95% of all personal property. As a device to overcome part of this difficulty, Campion took estates owned by persons over 25 and related them to all persons over 25

Table IX.—Distribution of Property of Persons over 25 by Ranges of Capital England and Wales, 1911–13 and 1936

in the country. In Table IX cumulative percentage figures are given showing the distribution of property of persons over 25 for 1911–13 and 1936. Prices were about 50% higher in 1936 than in 1911+13 and incomes about doubled during the period.

It can be seen that the distribution of capital was much more unequal than the distribution of income. Whereas 0.4% of the number of persons had 12% of all personal income, they owned 40% of all personal capital; and the working classes (that is, those in the range of incomes less than about £250 in 1938) which had some 60% of the total income had only 5% of the total capital in personal ownership. Comparing 1936 with 1911–13, a tendency toward more equal distribution was noticeable. In 1911–

13, about 1% of the number of persons owned almost 70% of the total capital; by 1936 this was reduced to 55%. But during the same period the ownership of estates by women became more common; allowing for this effect, the distribution of capital between families changed very little. There could have been some changes at the top of the pyramid, but the fundamental division between the top and the base did not change.

When all factors were taken into account it could be estimated that one-third of the number of families in Great Britain had estates over £100 in 1936 or thereabout; very little was known about the other two-thirds. Of 12,000,000 families in the country, 4,000,000 had more than £100 and sufficient details existed about the distribution of this number. Another 4,000,000, according to the estimate of J. Hilton (1944), owned just less than £100 in the period considered, while the remaining 4,000,000 had practically nothing.

British Commonwealth.—Turning to other British countries, no late information was available in 1946 for Australia. In connection with the census of 1933, data relating to the distribution of incomes were obtained, but C. Clark and J. G. Crawford (1944) showed conclusively that these data were defective; in particular there was a serious understatement of income by small independent producers. For the sake of completeness the figures are given in Table VII.

As the estimated number of occupied persons was only 2,175,000, it was clear that a large number of persons with small pensions or allowances must have been included, possibly in the lowest group.

In Canada, a pioneer study was carried out for 1942 and published alongside the national income estimates in 1946. The drawback of the publication was that agricultural incomes were not covered, as it was found impossible to obtain reliable information. The estimates, a summary of

which is given in Table X, were prepared by L. M. Read and were the result of co-operation between academic and government statisticians. Figures for higher ranges of income were based on income tax statistics. These were supplemented by data from the census of 1941 showing wage earners by income classes. The information coming from two distinct sources was then suitably adjusted. As agricultural incomes were excluded, together with income not allocated to the different ranges, the total of Canadian \$5,600,000,000 in Table X covered only about one-half of the national income. In the original publication detailed distributions were given distinguishing married men on the one hand, and single men and women on the other. Also, separate distributions were given for each of the provinces. Starting from the study for 1942 it was expected that annual estimates would be published by the dominion bureau of statistics.

No estimates of the distribution of capital existed for Canada and Australia, except the 1915 Australian figures which were subject to gross understatement. Information 585

on the distribution of income and wealth in other British countries, as far as it existed, was not sufficiently reliable to warrant inclusion.

Europe.—Statistics of European countries, other than the United Kingdom, were either discontinued during World War II or made irrelevant by postwar conditions. Such information as was available for prewar years was summarized and published in comparative form by C. Clark (1940). Owing to unsettled economic and financial conditions in most European countries, it was impossible, in 1946, to obtain useful figures. The Netherlands national income estimates, which follow the example of the British White Paper, did not contain the required information.

The outstanding exception was Sweden, where conditions remained stable during World War II and where excellent statistics existed already before the war. The Swedish Statistical Yearbook (in Swedish and French) published annual estimates and those for 1943 are summarized

in Table XI. The estimates are given in more detail in the original, distinguishing important occupational and social classes. The latest figures for distribution of capital referred to 1930 and were given in great detail in the same publication.

An attempt has been made in Tables X and XI to arrange the Canadian and Swedish income distribution in categories comparable with the relatively few categories of the British distribution in Table VIII. Approximately \$5 or kr.15 could be taken as the equivalent of £1. Both the Canadian and the Swedish statistics disclosed a more equal distribution than the British, though it must be remembered that the Canadian distribution did not cover agricultural incomes. The richest 0.4% of the population had 6.0% of the total income in Canada, 6.2% in Sweden, but 12.0% in the United Kingdom. About one-quarter of the total income accrued to the richest 6% in Sweden and the richest 3% in the United Kingdom.

But the tables show distributions of income before taxation, and it was known that the taxation of the rich is highest in the United Kingdom. Apart from the distribution of incomes given in Table VIII, important statistics were available for the immediate prewar years in the form of family budget studies and social surveys which made it possible to prepare estimates as to the distribution of total taxation in the United Kingdom, as well as to the distribution of benefits derived from public expenditure, on the basis of which it was possible to estimate the amount re-

distributed from the rich to the poor. No similar estimates, except those showing the amount of taxation at selected levels of income, were available for other countries.

The estimates are given in summary form in Table XII. The number of incomes in the different ranges was about the same in 1937 as in 1938 and these are not shown. The amount of incomes differs from the figures shown in Table VIII in so far as here undistributed profits and other nonpersonal incomes are allocated to the different ranges but income from national insurance is excluded (and included in social expenditure). Of the total taxation of £1,160,000,-000, some £480,000,000 was paid by those below £250 and £680,000,000 by the rest, about 15% of the population. Most social expenditure obviously benefited the poor. In addition to the bulk of social expenditure it was possible to allocate £80,000,000 in other expenditure, chiefly on the maintenance of roads. But certain other expenditure (for instance, expenditure on defense or general administration) could not be allocated to ranges of income without making certain assumptions. Even without these, the classes less than £250 received £60,000,000 more in benefits than they paid in taxation. Expenditure on desense and similar items together with the excess of interest on government debt over government interest on government property and the savings of public authorities came to £540,000,000. After making reasonable assumptions as to the allocation of this sum, it was estimated that, in 1937, £200,000,000-£250,000,000 was transferred from those above the £250 limit to those below it. This was equivalent to 5% of the national income. All taxation and public expenditures were included, that by central as well as local government. (See also Budgets, National; Census Data, U.S.; Income AND PRODUCT.)

Wedemeyer, Albert Coady

Wedemeyer (1897—), U.S. army officer, was born July 9, 1897, at Omaha, Neb. He was graduated from the U.S. Military academy in 1918, and from the Command and General Staff school in 1936. During World War II, he participated in the Sicilian landings (July 1943) as a combat commander under Gen. George S. Patton, Jr., and was appointed deputy chief of staff to Admiral Lord Louis Mountbatten, Allied commander in the Southeast Asia theatre in Oct. 1943. The following year, Wedemeyer succeeded Gen. Joseph W. Stilwell as commander of U.S. forces in China and as chief of staff to Generalissimo Chiang Kai-shek in the China theatre of operations. In Jan. 1945 he was promoted to the temporary rank of lieutenant general.

Welles, Sumner

Welles (1892-), U.S. diplomat, was born Oct. 14, 1892, at New York city. Educated at Groton school in Massachusetts and at Harvard university, he started his career in the U.S. foreign service as a secretary in the U.S.

embassy at Tokyo (1915–17). He was chief of the Latin-American affairs division of the state department (1921–22), U.S. commissioner to the Dominican Republic in 1922, and President Coolidge's personal representative in Honduras in 1924. Welles was appointed assistant secretary of state April 6, 1933, holding this post, save for a short interim appointment as ambassador to Cuba in 1933, until May 1937, when he was appointed undersecretary of state.

In the spring of 1940, he undertook a "fact-finding" mission to Germany, Italy, France and Great Britain, conferring with both Allied and axis leaders. During 1941, he held many interviews with sundry European and Asiatic diplomats, and also initiated moves to settle the Ecuador-Peru clash in the summer of 1941. He headed the U.S. delegation to the Pan-American parley that opened at Rio de Janeiro on Jan. 15, 1942.

Increasing friction with Secretary Hull over questions of policy was said to have resulted in Welles' resignation, announced Sept. 25, 1943. Shortly afterward Welles began a syndicated column on foreign affairs. He also wrote two books, The Time for Decision (1944) and Where Are We Heading? (1946), both dealing with U.S. foreign policy.

Western Australia

Politically, Western Australia ranks among the smaller

states of the commonwealth. Physically it is the largest state of all; c. 975,-920 sq.mi. in area and roughly one third of Australia. Pop.: (1937 est.) 462,-500; (1946 census) 493,700 of whom 235,000 lived in the metropolitan area of Perth, the capital. During the decade 1937-46 the governorship was vacant. The position of lieutenant-governor was held by Sir James Mitchell (appointed July 1933). Prime ministers; John Collings Willcock (1936-45); Frank Joseph Scott (after Aug. 3, 1945).

Like all other Australian states, Western Australia's production during World War II reflected the heavy drain of manpower for military services and the intense concentration of available labour on the claims of other war activities. Western Australian enlistments were the highest in the commonwealth in proportion to population. Gold mining suffered heavily owing to voluntary enlistments and diversion of labour and machinery for military purposes. Before the outbreak of war the gold yield, mainly from the Golden Mile line of lode of

Kalgoorlie, had reached its peak. Mining processes had been greatly improved, enabling the profitable working of ore of less than 8 dwt. The Big Bell, near Cue, owned by a U.S. company, was treating ore of as low a grade as 4 dwt. average and at a handsome profit.

In relation to the area of Western Australia, the population is small, but a great proportion of the state is suitable only for pastoral pursuits in which the percentage of labour to the square mile is low. Disastrous drought in the far northwest and the Murchison district, hit this primary industry heavily. Great areas of the pastoral districts in the northwest were without useful rain for seven years, and in parts of Murchison, drought lasted for ten years. The recuperative power of the pastoral country was amazing. In the Murchison district the country had been virtually denuded of vegetation, but within a few months heavy rains early in 1945 made the country ablaze with wild flowers of every colour and carpeted with herbage, all splendid sheep feed. The sheep "runs" in Western Australia, ranged from 500,000 to 1,000,000 ac. and in good seasons the larger properties carried 70,000 sheep. The long drought reduced sheep numbers by two-thirds, and all the skill and patience of pastoralists were required to preserve a nucleus of breeding ewes.

Western Australia had become a comparatively big wheat producer after World War I, but this industry too

had suffered from seasonal variations, and the reduction of the area cropped when the price of wheat fell to an unprofitable figure. Production in the southwest, where the rainfall exceeds 50 in., had made considerable progress, and there are great forests of hardwoods, notably the tough and heavy jarrah and the magnificent karri, towering straight as gun barrels, to 140 ft. to the first branch. A sound forest policy assured the permanence of the valuable timber industry. Dairying had also made strides in this fertile part of western Australia.

West Indies

An archipelago between Florida and the South American coast opposite the mouth of the Orinoco River, the West Indies group is less commonly known as the Antilles. The West Indies include the Greater Antilles (in order of size, Cuba, Haiti or Hispaniola, Jamaica and Puerto Rico), the Lesser Antilles including a large number of islands between Puerto Rico and the Venezuelan coast, the Bahama group northeast of Cuba, and certain more distant islands, including Curaçao, Aruba and Bonaire near the mouth of Lake Maracaibo in Venezuela. The land area is approximately 92,000 sq.mi. The population, estimated in 1945 at more than 15,000,000, is approximately 75% white and 25% Negro and mulatto in Cuba and Puerto Rico and from 80% to 100% Negro and mulatto elsewhere, except that in Trinidad about 40% is of East Indian origin. The religion is predominantly Roman Catholic; the languages used include Spanish, English, French and Dutch, in addition to various African dialects. Politically, the West Indies include the three independent republics of Cuba, Haiti and the Dominican Republic, two United States territories (Puerto Rico and the Virgin Islands), six British colonies (the Bahamas, Barbados, Jamaica, the Leeward Islands, Trinidad and Tobago and the Windward Islands), two French colonies (Guadeloupe and Martinique) and one Netherlands colony (Curação). In addition to prewar bases, five of the eight U.S. naval bases, sites for which were obtained from Great Britain in 1940, were built in the West Indies.

Economic Disruption.—The West Indies, an area of colonial economy, suffered grave economic dislocation in 1937 and later. The considerable oversupply of sugar in the world's markets especially seriously affected Cuba and other West Indian islands, where sugar is the principal agricultural product. The British islands in particular were adversely affected. One consequence of the disturbed economy was the greater fluidity of the agricultural population, resulting in considerable peasant migration from one island to another and from the islands to mainland areas. The most serious result was the massacre of several thousand Haitian peasant farm workers in the fall of 1937 after they had filtered across the border of the Dominican Republic for longer or shorter periods. Several of the units in the West Indies, notably Cuba, however, expelled migratory agricultural labourers in 1937-38 in order to reduce competition with their own labouring classes.

The economic impact of the European war brought serious repercussions in the West Indies, depending, as most portions of the area did, either on export of staple agricultural products or on the tourist trade. Certain islands, notably Cuba and the Bahamas, anticipated that the arbi-

trary cessation of a tourist flow to Europe would divert much of it to them. It was also expected that the blocking of normal extra-American sources of supply of products in which the West Indies competed would ultimately result in an improvement of that area's commercial position.

Effects of World War II upon the West Indies during 1940 were primarily of three sorts: the acquisition by the United States of several sites for development of naval and air bases, the plight of the French colonies following the collapse of France in June and the general problem of the future of European possessions in the Caribbean, as climaxed in the second inter-American conference of foreign ministers at Havana, Cuba, in July. The development involving naval bases concerned primarily the British colonies (where all of the leased sites were located), but in a general way it affected the entire archipelago as constituting a potential defense arc off the Atlantic terminus of the Panama canal. The executive agreement between Prime Minister Winston Churchill and President Roosevelt for the 99-year lease of naval base sites in exchange for 50 overage destroyers was formally consummated by an exchange of notes on Sept. 2, 1940, following which inspections, surveys and construction proceeded rapidly in the locations immediately involved. The institution of the Vichy regime in France posed a problem for the American republics because of the presence of a pro-Vichy administrator, Adm. Georges A. Robert, as governor of Martinique. The strategic location of Martinique and Guadeloupe, the internment there of various planes and units of the French fleet and the storage of large amounts of French gold made those colonies of concern to the hemisphere until 1943, when agents of Gen. Charles de Gaulle succeeded to the administration of the colonies.

Political-Strategic Question Marks.—The rapid conquest of the Netherlands and France in the spring of 1940 and the fear that Great Britain might soon suffer the same fate caused the convening at Havana on July 21, 1940, of the second foreign ministers' conference, with the question of the disposition of European possessions in Middle America, in the case of a German attempt to control them, as the chief topic on the agenda. Other and more remote European possessions, such as the Falkland Islands, the mainland colonies of British Guiana and British Honduras, and the northern French colony of St. Pierre and Miquelon, were theoretically involved, but the main attention of the conference centred on the European colonies in the West Indies. The formula for "provisional administration" of those possessions by one or more American republics, in the case of later contingencies, represented a considerable advance in international co-operation in the hemisphere.

The political and military contingencies anticipated by the American foreign offices in 1940 did not materialize, but the West Indies felt a more extreme economic impact from World War II in 1941. The normal trade of the European colonies had been largely with their respective mother countries. Although inevitable wartime reorientation threw it chiefly to the United States, it was seriously interrupted by the lack of adequate shipping because of submarine losses and diversion to more important wartime purposes; normal imports were also severely curtailed by the unavailability of consumer goods to be imported from the U.S. Large surpluses of many products began to accumulate, but by the latter part of 1941, and especially after the spread of the war to the Pacific, sugar (the most important product), long under restriction because of world overproduction, came into heavy demand. Piled-up stocks were generally cleared, and 1942 crops were contracted for

in advance. Cuba, Trinidad and some other islands where mineral resources were known to exist undertook more careful surveys of such resources in order to learn more definitely what might be exploited for the war effort. The Netherland Islands of Curaçao and Aruba, long famous as one of the world's largest centres of the oil refining industry, were especially subject to economic dislocation, but ultimately began a huge program of enlargement of their industrial facilities and capacity. Communications facilities by sea were seriously interrupted as early as 1941 but those by air began to be expanded.

The course of developments in the West Indies during 1942 continued to be dominated by the war. With the exception of the French colonies, the position of which remained anomalous, the entire archipelago was not only at war with the axis powers, but was a combat area as well. Submarine attacks and ship losses became commonplace. These, coupled with the extensive diversion of shipping needed for more immediate belligerent purposes, served to disrupt trade seriously. Sugar continued to be in abnormally heavy demand, but shipping shortages prevented the export of a large portion of the crop from many of the islands, even from Cuba, one of the world's largest producers and located only about 100 mi. from the United States mainland. The greatly increased need for mineral resources focused some attention during the year on Jamaica, where existence of bauxite deposits was reported. Perhaps the most important political development of the year affecting the West Indies was the creation by Great Britain and the United States, on March 9, 1942, of the Anglo-American Caribbean commission, designed to study and make recommendations with regard to the economic and social problems and needs of the possessions of those two countries in the Caribbean area. By 1944 the scope of the commission's activity and support became enlarged to include the possessions of France and the Netherlands in the West Indies and the Guianas on the South American

The main political development in 1943 was the shift in the political status of the French colonies from allegiance to the Vichy regime to control by the French Committee of Liberation under Gen. Charles de Gaulle. Popular reaction in the French islands had long been sympathetic to the Allied cause, and the change in administration brought the entire archipelago, for the first time in its history, into war with a common enemy. The effectiveness of the Allied naval and air patrol in Caribbean and Atlantic waters considerably reduced the submarine menace to West Indian shipping, although the sector continued to be a combat area. Construction work on naval and air base facilities, in the British leased sites and elsewhere, tapered off before the end of 1943, and United States and other Allied use of such bases greatly increased the effectiveness of defense of the islands and the Middle American mainland. Employment and other economic conditions during 1943 showed great variation in different parts of the West Indies. Trinidad and Curaçao, for example, were centres of war production and hence flourishing, but Jamaica, more nearly completely agricultural, suffered greatly from inability to ship her products.

The year 1944 was marked by a continued decline of the submarine activity which had harassed the West Indies for three years, with a consequent recovery in exporting and other economic activity. Restoration of more nearly normal peacetime trade was hampered in part, however, by a serious hurricane which swept through parts of the West Indies in the latter half of Aug. 1944, ravishing large agricultural areas and adversely affecting production and

exporting for months thereafter; Jamaica was especially hard hit by the hurricane. The various West Indian colonies and independent states were all concerned in 1944 with efforts to effect readjustments in anticipation of peace. An important step toward that end was the holding of the first West Indian conference, at Bridgetown, the capital of Barbados, in March, under the auspices of the Anglo-American Caribbean commission, but participated in by representative, of French and Netherland possessions as well. The conference was concerned mainly with economic and social problems and proposals for long-range planning and public-works construction.

Readjustment to Peace.—Economic dislocation was general in many parts of the West Indies in 1945, with the ending of World War II, and the principal general problem was readjustment to peacetime conditions. The return to their previous island homes of many persons employed during the war in the Canal Zone or in the United States aggravated an unemployment condition which already was serious in certain areas. Another factor intensifying the impact was the cessation or tapering off of various wartime agricultural ventures by the United States, especially its programs of encouragement of rubber and abacá production in various West Indian islands. The British government took steps in certain of its colonies to grant a liberalized franchise and increased autonomy. Tentative suggestions were advanced in various quarters during 1945 for mutual tariff reductions among the several West Indian units, with the eventual objective of creation of a free trade area. It was difficult to approach that problem, however, since it involved not only the British colonies, but the other three powers as well; the independent states did not figure in such discussions to any important extent. The end of the war brought the prospect of considerable improvement in communications and transportation facilities, especially with regard to air services. Both the British West Indian airways and KLM (Royal Dutch air lines) announced plans for expansion of their services, while Pan American airways in certain instances enlarged and in others contracted its services.

A joint conference, with participation by representatives of British, United States, French and Netherland possessions in the West Indies, met at St. Thomas, U.S. Virgin Islands, beginning Feb. 21, 1946, to consider problems of the area. Parts of the West Indies, but very largely the Dominican Republic, were severely affected by a series of earthquakes (with resulting tidal waves) beginning Aug. 4, 1946; the quakes were among the heaviest ever recorded in the West Indies, although loss of life was far less than in the volcanic eruption in Martinique in 1902.

West Indies, British

Single islands and groups in the Caribbean sea, the British West Indies are organized politically as six British crown colonies. They are: Bahama Islands (q.v.), Barbados,

Jamaica and dependencies, the Leeward Islands, Trinidad and Tobago and the Windward Islands. Jamaica is the third in size of the four islands comprising the Major Antilles. The Leeward Islands and the Windward Islands (and Barbados) form a large part of the Lesser Antilles. Trinidad is a single island just north of the Orinoco river delta. The total area (excluding the Bahamas) is approximately 8,065 sq.mi. and the total estimated pop. (1946), 2,397,567; earlier estimates of pop. were: 1940, 2,233,000; 1944, 2,347,113; 1945, 2,366,949. No census had been taken, except in 1943 in Jamaica and dependencies, after 1931 (in some cases earlier); the British government made plans in 1945 to take early census in the remaining units. Density of the different islands varies greatly, that of Barbados (almost 1,300 per sq.mi.) is one of the highest of any political unit in the world. The racial composition of the population is from 75% to almost 100% Negro, although the population of Trinidad was estimated to include 180,509 East Indians and a small number of Chinese. Aboriginal Indians have almost entirely disappeared, though on St. Vincent and Dominica a few Indian-white and Indian-Negro descendants remain.

The political organization of the different islands reflects no uniformity and various anomalies. Each of the colonies has a royally appointed governor. Barbados has an executive council, a legislative council of 10 nominated members and a house of assembly with 24 elected members. Jamaica has an executive council of 10 members (5 elected by the house of representatives from their own members), a legislative council (with a majority of non-officials) and a house of representatives with 32 members elected by universal suffrage. The Cayman Islands and the Turks and Caicos Islands are political dependencies of Jamaica; the latter, 450 mi. northeast of Jamaica, are geographically a part of the Bahamas. The Leeward Islands have a general federal type of government. A general legislative council with an ex officio membership of eight plus nine elected non-officials represents all of the islands in the colony; a separate legislature for local affairs serves each of three of the constituent presidencies (all except the Virgin Islands, for which the governor is directly responsible). The Leeward and Windward Islands have joint police and judicial officials. Trinidad has an executive council of 8 members and a legislative council of 18, each council including some officials ex officio and some non-official members, both nominated and elected. The Windward Islands are not federalized, lacking a common legislature, laws, revenues, or tariffs; they do unite for certain purposes, however. The governor of the colony is ex officio administrator of Grenada. Each of the constituent islands or island groups has its own legislative council. British Guiana (on the South American mainland) and British Honduras (adjoining Guatemala) are for some purposes regarded as within the British West Indies; after 1940, for example, they, together with the island colonies, had a common comptroller for development and welfare, with whom were associated advisers in special fields.

Post-Depression Turmoil.—The effects of the world depression of the 1930s were felt especially heavily in the West Indies, with their primary reliance on export of agricultural staples, particularly sugar, which were largely at the mercy of world markets. The result was that low price levels for exports accentuated an already severe unemployment problem. This in turn led to general unrest and to serious labour riots in Jamaica, Trinidad, Barbados and elsewhere. The British government in consequence

established on Aug. 5, 1938 a West-Indies royal commission (informally known as the Moyne commission from its chairman, Lord Walter G. Moyne) to investigate social and economic conditions in the British Caribbean colonies and British Honduras and British Guiana. The commission made a prolonged study and published a portion of its formal report in Feb. 1940. Its main recommendations were for the establishment of a West Indies welfare fund, to be financed by an annual grant of £1,400,000. In the field of social services, it urged improvement of educational facilities, the establishment of a unified health policy and betterment of housing conditions. Great stress was put on the acute problem of labour relations, with recommendations for a labour adviser, a system of wage boards and industrial courts, and consideration of unemployment insurance, improved factory regulations and workmen's compensation. In the economic field, the commission took cognizance of world overproduction of the principal West Indies agricultural products and the problem of increasing overpopulation, and, after approving an increased sugar quota, gave qualified endorsement to government support of industrial enterprises. For agriculture itself, the commission recommended a centralization of agricultural policies and direction and increase of agricultural education, along with special soil surveys and inquiries into various means of developing forms of agriculture best suited to the region, with stress on the production of foodstuffs for local consumption, and development of a comprehensive land settlement program. Consideration was also given to an improved communications policy.

The long-continued agitation for complete self-government based on universal suffrage was met by a commission recommendation of political federation as an ultimate, but not immediate, end, with a greater actual participation of elected representatives and a substantial reduction in the qualifications required of elected members of legislative councils. Political federation, the commission felt, should first be given a practical test through merger of the Leeward and Windward Islands administration, using the existing Leeward Islands government as a model. Need for betterment of appointive administrative personnel was also stressed. The Moyne report was generally well received in both Great Britain and the West Indies, and its recommendations were the bases of the subsequent Colonial Development and Welfare act, passed by parliament in July 1940. This act authorized sums for colonial research, development and welfare, with an immediate expenditure in the tropical American colonies of £350,ooo through grants-in-aid, including £27,810 in the Windward colonies.

In Jan. 1939 following the end of a general strike which had paralyzed Jamaica economically, the insular government promised economic and social reforms, but when it failed to put them into effect immediately a strike of water front workers in mid-February brought new disturbances and obliged the governor to proclaim a state of emergency for several days. Underlying unrest continued until after the Moyne report. Following the Moyne report and the parliamentary legislation of 1940, Sir Frank Stockdale, a comptroller and a veteran in colonial service, proceeded to the West Indies and, with his advisers, visited practically every island in that area. In a report published as a white paper in 1943, he outlined approved schemes for bettering public health, agriculture and communications. The report was prefaced by a brief description of the natural advantages and disadvantages of each colony and an account of the problems to be solved. In the meantime, instead of setting up the proposed welfare fund, it had been decided that the West Indies were to share in the general financial provisions made by the development and welfare act of 1940, fixed at $f_{5,000,000}$ annually for ten years.

Immediate Impact of War.-The outbreak of World War II in Sept. 1939 had prompt repercussions throughout the British West Indies, and the colonies at once put themselves on a war footing. Jamaica and Trinidad granted their respective governors emergency powers and imposed press censorship. Price regulation was resorted to in an effort to hold down the mounting cost of living, and a licence system for imports was established. This system was made necessary by the decline of the pound sterling in terms of the dollar, and the consequent shortage of dollar exchange. In spite of the various restraints imposed, the first month of war saw heavy price increases, especially in Jamaica, and a retrenchment in that colony's public works program and other governmental activity as a result of rising costs. Nevertheless, the agricultural situation was regarded as satisfactory, especially in Trinidad, where the outlook was for higher agricultural prices. A sharp wave of indignation swept the entire British West Indies in Oct. 1939 when it was proposed in the United States senate that the United States should seize the British islands as the only means of obtaining repayment of the British debt to that country.

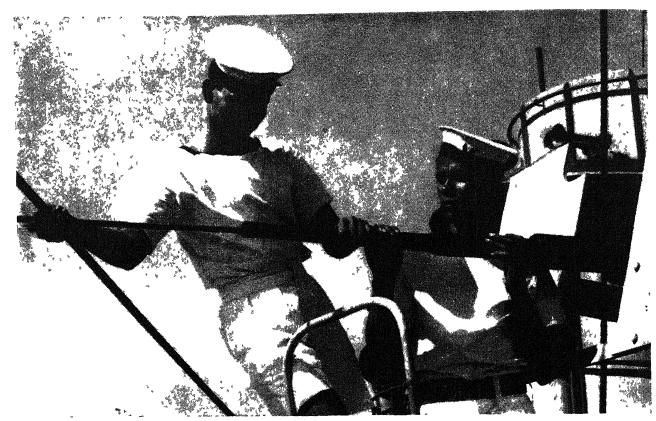

A much more significant development involving the British West Indies was the Roosevelt-Churchill agreement of mid-summer in 1940 for the trade of overage destroyers for naval base sites. The executive agreement was crystallized and definitely formulated in an exchange of notes between the two governments on Sept. 2, 1940, under which Great Britain made available to the United States "for immediate establishment and use of naval and air bases and facilities for entrance thereto and protection thereof" sites in Newfoundland, Bermuda, the Bahamas, Jamaica, the Leeward and Windward Islands, Trinidad and British Guiana. These were to be leased to the United States for 99 years, free of all charges other than those necessary to compensate owners of private property. Several high United States naval and other officials, including Secretary of the Navy Frank Knox, visited the West Indies during the remaining months of 1940, and in December President Roosevelt himself made a tour of inspection. Some difficulties were encountered in selection of a specific site on Trinidad, regarded by many as the most important location of all. United States officials objected to allocation of a swampy area for an air and naval base, though colonial officials preferred that because of its isolation from heavily populated districts.

These difficulties were adjusted in Jan. 1941 and a definitive agreement was signed at London on March 27 replacing the tentative agreements of the previous year. Sites in Jamaica included a fleet anchorage of two sq.mi. in Portland bight, the Portland ridge peninsula shoreline, Manatee bay shoreline and adjacent areas and the 50-ac. Pigeon Island; the total area was about 55 sq.mi. Two tracts on Antigua in the Leeward Islands were obtained at Parham harbour and on Judge's bay, totalling about 700 ac. Trinidad facilities, totalling about 25,000 ac., included 4 air and naval base areas on the west coast, special anchorage rights in the Gulf of Paria and wharfage facilities at Port of Spain. Six areas on St. Lucia in the Windwards aggregated about 1,300 ac. and included Gros Islet bay and an airfield at Vieux port.

Prior to 1940 the only fortified places in the British West Indies had been Barbados, St. Lucia and Jamaica, all used primarily as coaling stations. The United States in 1940 rushed construction at the sites it had gained, and affected formal occupation during that year. Economic effects of the construction work were felt in some instances, notably in Trinidad, with labour shortages, rising wage scales and stimulated buying power. The labour shortage in Trinidad-the greatest single centre of development with an expenditure of more than \$17,000,000 involved-necessitated relaxing of the immigration restrictions to permit the entry of Barbadian and other agricultural labour. The local expenditure alone in Jamaica was estimated at in excess of £1,000,000. Construction work was largely completed in 1941, and the tapering off of employment in 1942 brought repercussions, accentuated by the fact that construction wages had been greatly in excess of local standards. Heavy pay rolls for United States defense personnel and some continuing construction were an economic factor almost throughout World War II, however, and continued to swell savings bank deposits in several islands.

Caribbean Commission.—An Anglo-United States agreement of March 9, 1942, established the Anglo-American Caribbean commission (A.A.C.C.). This body, consisting of six members (three from each country), was designed to deal primarily "with matters pertaining to labour, agricul-ture, housing, health, education, social welfare, finance and related subjects in territories under British and United States flags," and to advise the respective governments. Sir Frank Stockdale and Charles W. Taussig of the United States served as the original co-chairmen of the commission. Stockdale's headquarters were in Barbados, but a permanent secretariat was established in Washington, with secretaries of the British and United States sections respectively. Confronted with urgent problems arising from the submarine menace in the Caribbean, the commission concerned itself with the regulation of food imports and increasing local production, with the importation of goods from Canada and the United States and the ships to carry them, and with formation of a schooner pool for the better utilization of local vessels in interisland trade. A fishing survey was also organized, the position of the sugar industry was examined, and the problem of venereal disease was attacked. Organization of the commission was modified somewhat in June 1945. Membership for each country was increased to four, with two of the British representatives nonofficial West Indians. Sir John Stuart Macpherson succeeded Sir Frank Stockdale in 1945 as British co-chairman, with headquarters in Kingston, Jamaica. The territorial scope of the commission's interests had been broadened to include, first, Netherlands, and then French representatives; it then functioned as a Caribbean commission and on July 15, 1946, Lawrence W. Cramer, former governor of the (U.S.) Virgin Islands, was appointed secretary general.

The Caribbean Research council was established provisionally in 1943 as an advisory body to the A.A.C.C. It was made permanent on March 1, 1945, with headquarters and a central secretariat in the West Indies and with five subcommittees dealing with agriculture, nutrition, fisheries, and forestry; building and engineering research; industries; public health and medicine and social sciences. A further development was the formation of the West Indian conference in 1944 to discuss and formulate plans for inter-colonial co-operation. Membership included two delegates from each British colony and each United States territory in the West Indies. The first meeting of the

Members of the Trinidad royal volunteer reserve servicing guns aboard a minesweeper after patrol duty in 1944. The service was organized in 1939 and operated by the British admiralty with recruits drawn from all areas in the West Indies

conference was at Bridgetown, Barbados, March 21-30, 1944, with delegates and representatives from Great Britain and the United States, the various British Caribbean colonies, and observers from Canada and the Netherlands West Indies (including Surinam). Included in the agenda were plans for raising nutritional levels and increasing local food production, fisheries development, postwar absorption of war workers and veterans, industrial development, quarantine and health protection, and long-term public works construction through regional planning boards and an international Caribbean planning commission as part of the A.A.C.C. To these various ends, the conference recommended enactment of uniform legislation in the various political units affected and a continued interchange of the results of different research projects already sponsored by the commission. It urged the development of secondary industries, where feasible, as a means of diversification and of satisfying local needs, and recommended economic surveys and development of transportation and resources in British Guiana and British Honduras which, though mainland colonies, came within the scope of the commission.

The War Moves Closer.—The British West Indies were much more acutely affected by World War II in 1942 than at any time previously. For the first time, actual hostilities were carried on within their territorial waters. Submarine sinkings and the diversion of ships for the transportation of supplies to overseas war fronts seriously impeded the exportation of agricultural products and sharply reduced the volume of imports. Submarines were active especially in the middle months of 1942. Shipping anchored in Carlisle bay, Barbados, was attacked in September. Later in the year the submarine menace abated

but did not disappear. Interisland and external trade was badly disrupted. The islands undertook programs of agricultural self-sufficiency. Barbados made it compulsory to devote fixed percentages of land area to food crops and livestock. Other colonies subsidized acreage put in foodstuffs and guaranteed minimum price returns. Licensing of imports curtailed or prevented use of shipping space for non-essentials, and, to achieve maximum efficiency in the importation of necessities, official buying pools were set up. Exportation of commodities needed for local consumption was forbidden. As an antidote to the acute economic ailments, the British government undertook to purchase the entire crops of certain agricultural products in 1942, notably Jamaica's bananas, citrus and sugar, even when shipping space and available markets were entirely lacking. Financial advances were made for specific projects, especially those furthering agricultural diversification and self-sufficiency.

The decreased menace of axis submarines in West Indian waters in 1943 resulted in a less acutely felt shipping shortage than in 1942. Living costs soared in many of the islands, and rationing and price controls were necessary on many commodities. Employment and other economic conditions were varied in 1943; Trinidad, for example, suffered from a manpower shortage that seriously affected harvesting of crops, while Jamaica was faced with an unemployment problem. Jamaican banana exports by 1943 had fallen to about 6% of the 1938 figure. Some 9,435 Jamaican agricultural labourers went to the United States under contract in mid-1943, and by the end of the year their money order remittances to the island exceeded £100,000. The West Indian colonies continued to be the principal recipients of colonial development and welfare loans and grants during 1943, being allotted more than £2,500,000 of a total of £4,500,000. These included projects for road construction in the Leewards, rural health, a food storage plant in Grenada and numerous others. The total cost of West Indian schemes approved by 1943 was about two-thirds of all expenditures sanctioned under the parliamentary act for the whole empire down to that date. The trend toward nationalization was further evidenced by the action of the government of Trinidad in acquiring 50% of the shares of the British West Indian airways, principal aviation company operating in the British West Indies, and offering them for sale by popular subscription or to such West Indian colonial governments as might be interested. Several imperial grants were made in 1944 under the development and welfare act in furtherance of the general recommendations of the Bridgetown conference. Especially noteworthy was a £525,000 free grant for a five-year agricultural program in Jamaica recommended by the agricultural adviser for the West Indies.

Reform Measures.—Improvement of West Indian educational facilities began to receive official consideration in 1944. The West India committee of the royal commis-

sion on higher education in the colonies, headed by Sir James C. Irvine, visited the various colonies in that year and in its report, published in July 1945, recommended that a University of the West Indies be established in Jamaica, with faculties of agriculture and agricultural sciences, arts and sciences, and medicine, and departments of education and extramural studies. The capital cost of the project was estimated at £1,130,000; the committee proposed that it should be provided by the British government, although maintenance would be met by contributions from the colonial governments involved and by endowments and fees. A further educational proposal advanced in 1945 was that the government and denominational teacher-training institutions in Trinidad should be replaced by a central training institute which would serve the Leeward and Windward Islands as well.

changes in the British West Indies had crystallized as early as 1940; Jamaica and Trinidad were the colonies first concerned. Changes proposed in that year (and in 1941 for Jamaica) did not entirely meet the demands of the island's semi-socialistic People's National party, although they generally met with qualified approval. Discussion of political modernization in Jamaica proceeded through 1942 and 1943 but it was not until Nov. 20, 1944, that the new constitution could be promulgated. It was understood that it would be tried out for a full electoral period of five years. Elections for the Jamaican house of representatives in Dec. 1944 resulted in an overwhelming victory for the Labour party, which obtained 23 seats; the People's National party won 4, the Independents 5 and the Democratic party none.

Proposals for inter-colonial political federation, either functional or organic, extended back to the time of the Moyne report and earlier. A short initial step had been taken through the establishment of limited joint administrative and judicial services for the Leeward and Windward Islands. Later in World War II, however, and espe-

cially in 1945, more far-reaching proposals were repeatedly and thoroughly discussed. Oliver Stanley, secretary of state for the colonies, addressed a letter in March 1945 to the governors of the eight British Middle American colonies (six in the West Indies plus British Honduras and British Guiana) proposing that their peoples give consideration to the advantages of political federation. He argued that greater economic stability would result, administrative costs could be cut and efficiency increased, and that such a federation might anticipate an ultimate status of selfgovernment comparable to that of a dominion. The proposal was not too well received in the Bahamas but met a generally favourable reaction elsewhere. The British proposals were motivated in part by the desire to make the colonies more nearly self-supporting financially. The British government indicated in 1945 that it would gradually cease extending subsidies to Jamaica over a five to tenyear period. On the other hand, the mother government's financial assistance in certain directions continued on a generous scale. Under the terms of the Development and Welfare act of 1940, the West Indian colonies had received, to March 31, 1945, a total of £8,690,113 (including £1,263,-492 in loans, £60,030 for grants for research, and the re-

mainder as grants). A new Colonial Development and Welfare act, effective April 25, 1945, more than doubled the sums available from the British treasury and extended the terminal date for development projects to March 31, 1956. In the meantime, discussions proceeded with regard to a unified West Indian currency, uniform quarantine regulations, a unified radio service, and a customs union. A department of civil aviation was established during 1945 to serve all of the British West Indies; government subsidies enabled the British West Indian airways to expand its services, and the obvious governmental policy was to favour an aviation monopoly. The incorporated Chambers of Commerce of the British Caribbean met at Basseterre on St. Kitts-Nevis in May 1945 to discuss development of travel, the proposed customs union, commerce with Canada, etc. The Trinidad legislature in 1945 unanimously approved the Stanley proposal for federation. A somewhat less favourable reaction resulted from a conference of two delegates from each of the four constituent colonies of the Windward Islands which met at St. George's on Grenada in Jan. 1945 to discuss federation with the Leeward Islands;

the conference recommended that the matter be further discussed at a meeting of the non-official members of the several legislatures concerned. Under Secretary Arthur Creech Jones reported on March 1, 1946, that a closer union of the Leeward and Windward Islands would later be formally proposed. A joint conference, including British, French, Netherlands and United States representatives, met in the U.S. Virgin Islands beginning Feb. 21, 1946.

The other major concern of the British West Indies in 1945, in addition to federation, was the restoration of a peacetime economy. The important economic policy committee rendered its report (the "Benham report") for Jamaica early in 1945, proposing a comprehensive plan for the economic rehabilitation of the island. The incorporated Chambers of Commerce gave important consideration to economic problems in view of the imminent end of the war in Europe. The Caribbean commission held an important series of meetings in Washington at the end of July 1945 to consider political and economic problems as

conditioned by the end of World War II. Consideration was subsequently given to the holding of a second West Indian conference comparable to the one at Bridgetown in March 1944. Considerable numbers of Barbadians and some from other islands were recruited for work in the United States, especially in the second quarter of 1945, although other islands' residents were at the same time returning after periods of employment in the United States. Jamaica was in certain ways harder hit economically in 1945 and 1946 than were the other colonies, especially because of the disastrous hurricane of Aug. 20, 1944, which destroyed some 90% of the island's banana trees and 40% of the coconut palms. The injury to the banana industry came just at the time when the more favourable shipping picture might have permitted a considerable recovery from the wartime slump in exports. As it was, no shipments of Jamaican bananas to Great Britain could be resumed until Dec. 15, 1945. The Mona reservoir on the Hope river at Kingston, Jamaica, construction of which was begun during the war period, was the largest engineering project ever undertaken in that island; when completed at an estimated cost of £460,000 it would impound 700,000,000 gal. of water. Economic unrest in Kingston, Jamaica, in Feb. 1946 culminated in a week-end "reign of terror" shortly after the middle of the month. A subsequent general strike ended only on March 10, but further violence broke out early in July.

West Virginia

A state in the Appalachian mountain region in the eastern part of the United States, West Virginia is popularly known as the "Panhandle state" or the "Mountain state." West Virginia was formed from Virginia during the American Civil War and was admitted to the union, June 20, 1863. Area, 24,282 sq.mi.; population (1940) 1,901,974, of which 1,742,320 were white (41,782 foreign born). The total urban population was 534,292. On July 1, 1944, the bureau of census estimated the population of the state at 1,715,984. Its capital is Charleston (population 67,914 in 1940). Other chief cities are Huntington (78,836) and Wheeling (61,099).

Principal state officers in 1937-40 were: governor, Homer A. Holt; secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney-general, Clarence W. Meadows; commissioner of agriculture, J. B. McLaughlin; state superintendent of schools, W. W. Trent.

All these officials except the governor were re-elected in Nov. 1940. M. M. Neely was elected governor. In the presidential election of 1940, Franklin Delano Roosevelt received 496,146 votes and Wendell Willkie received 372,662 votes. For governor of the state the vote stood 496,028 for Neely and 383,698 for D. Boone Dawson. Other state officials (Democrats) were elected by majorities ranging

from 141,745 for secretary of state to 112,000 for commissioner of agriculture. For U.S. senator, Judge Harley M. Kilgore received a vote of 492,413 and Thomas B. Sweeney received a total of 381,806.

In June 1942 Clarence W. Meadows, attorney-general was succeeded by William S. Wysong, who had been serving as president of the board of control.

In the elections of 1944, Clarence W. Meadows was elected governor. Ira J. Parthlow was elected attorney-general. Re-elected were: secretary of state, William S. O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; state superintendent of schools, W. W. Trent. In the 1944 presidential election Roosevelt received 392,777 votes and Thomas Dewey received 322,819. (J. M. CA.; X.)

Weygand, Maxime

Weygand (1867—), French soldier, was born at Brussels, Belgium, Jan. 21, 1867. He studied at the St. Cyr Military academy and at the Cavalry school at Saumur. He was commander of a hussar regiment in 1912. A month after the outbreak of World War I, he was appointed a temporary colonel (Sept. 1914) and was chief of staff of a French army. In 1916, he was promoted to general of a brigade. He succeeded Marshal Ferdinand Foch in 1917 as French representative on the Inter-Allied General staff. In April 1918, he was appointed Foch's chief of staff.

In 1920, Weygand reorganized the Polish army and directed the Polish counter-offensive that turned back the soviet forces from Warsaw. Later, he held a number of high posts in the French army; he was high commissioner to Syria (1923–24), inspector-general of the army (1931–35) and commander of French forces in the Levant (1939–40).

On May 19, 1940, nine days after the start of the German invasion of the Low Countries and France, Weygand succeeded Gen. Maurice Gamelin as commander in chief of the Allied armies. He promptly dismissed 15 generals and planned a "defense in depth" but was no more successful in stopping the German blitzkrieg than was his predecessor. When Marshal Henri Pétain replaced Paul Reynaud as premier, Weygand was named minister of defense in the cabinet. He was "relieved" of this post, Sept. 6, 1940, and dispatched to Africa to deal with the revolt of various French colonies whose governors joined Gen. Charles de Gaulle's Free French movement. Pétain appointed Weygand French pro-consul in Africa in 1941 and then governor-general of Algeria in July of that year. However, Weygand retired as pro-consul on Nov. 20, 1941.

After the Allied landings in French North Africa, Weygand was arrested by the Germans. He was freed by Allied troops in May 1945, but was arrested on his return to Paris on charges of "attempts against the internal security of the state."

The following July, the French high court ordered seizure of his property and assets.

Wheat

The world wheat situation changed completely during the decade 1937–46. A large and growing supply piled up during the years 1937 to 1942 and then suddenly was used up in three years. The world's supply became short. In 1937, the world crop was about the average of the previous decade, although the United States had small crops in 1933 and 1934. A big crop in Europe in 1938 raised the world's total in excess of 4,559,000,000 bu., a high point that had not been equalled for ten years. This estimate did not include China and the soviet union, both large producers of wheat consumed domestically for the most part. Total world exports were estimated at 519,000,000 bu. in 1937, principally from Australia, the United States, Canada and Argentina. An estimate for 1938 which included 1,500,000,000 bu. for the soviet union and 640,000,-000 bu. for China gave 6,587,000,000 bu. as the world's total wheat crop. After 1938, estimates for the soviet union were omitted and those for China were mere approximations. The world crop of 45 countries, which represented about 95% of world production, excluding China and the soviet union, was put at an average of 3,774,000,000 bu. in 1935-39.

An increase was reported in 1941 and 1942, a decline to less than the prewar average in 1943 and an increase to 3,797,000,000 bu. in 1944. Drought cut the production in Europe and Africa in 1945, bringing the total down to 3,570,000,000 bu.

Better crops were reported in nearly all countries in 1946, but mid-year reports indicated that exports might not be as large as in 1945. The world stocks of wheat reached the high total of 1,740,000,000 bu. in 1943, about three times the average before 1937. By 1945, these stocks had been exhausted, and exports declined accordingly. The crops of many countries were larger for domestic use, which was expected to reduce the demand for relief wheat by another year. By July 1945 wheat stocks in the big four exporting countries were 25% less than the prewar average.

Canada contributed a large share of the supplies of wheat for Britain. The crop of Canadian wheat was very small in 1937, only 180,210,000 bu. compared with an average of 312,399,000 during 1935-39. Production recovered in 1938, and a crop of 520,623,000 bu. was harvested in 1939. Prices were low and a support program

was started; a trade agreement was signed with Britain. The 1940 crop increased further, but that of 1941 was off to 314,825,000 bu. Again in 1942 the Canadian crop was large, 556,684,000 bu., followed in 1943 by a reduction of more than half, to 284,460,000 bu. Again in 1944, production recovered to 435,535,000 bu., but slumped again in 1945. The acreage was increased in 1946 and the crop once more was in the higher levels. Throughout the decade, the Canadian crop was a succession of large and small yields.

Australia played a less important role in the wheat trade because of two factors; the shipping shortage in the early days of World War II, and the droughts of 1944 and 1945. The prewar average production of Australia was 169,744,000 bu., which was increased to 210,000,000 bu. in 1939. The crop of 1940 was poor—only 83,192,000 bu. Then followed three almost normal crops, but production was cut again by the drought of 1944 to only 53,000,000 bu., the smallest in two decades. Seeding was increased for the 1946 crop, and an output of 135,000,000 bu. was expected, of which about 55,000,000 bu. was likely to be available for export.

In 1946, the Food and Agriculture organization made a world food survey to determine the actual food consumption of different countries, also the needs, shortages, and probable needs in 1960. A sufficient supply of wheat to meet world demands was expected after the 1948 crop was harvested. There was believed to be considerable possibility of increasing production. The report stated that in areas containing more than half the world's population, the supply of food in good years before World War II was sufficient only to supply 2,250 calories per day per capita. Another third of the world's people had an average of 2,750 or more calories daily while the remaining sixth were somewhere between these levels. The conclusion was that the world needed a larger food supply, of which wheat would form a very important part.

United States.—The U.S. wheat crop, second only to corn as the most important crop, supplied almost a third of the world's crop in 1946. A record yield on a near-record acreage returned high-record crops at a time of vital need. Both stocks and production reached unprecedented heights. Wheat was grown on about one-sixth of the nation's cropland, in every state. The use of machinery proceeded further with wheat than with any other major U.S. crop. It was the sole cash crop in many areas and was grown in rotation with other crops almost everywhere.

A large world wheat crop in 1938 caused prices to drop from 96 cents per bu. for the 1937 crop to 56.2 cents for the 1938 crop. Reduction of acreage was advised by the Agricultural Adjustment administration, and the harvested area dropped to about 52,668,000 ac., where it remained for two years, and did not rise much until 1944. In the early years of World War II, wheat-adjustment programs were continued in effect as stocks on hand were very large. The war needs were for other crops, and farmers were advised to limit wheat acreage and plant feed crops and oil-seeds wherever possible. Prices of other crops were supported, and the whole educational program was directed toward limiting wheat. Favourable weather, however, in these early war years brought excellent yields which offset the acreage reduction to a large extent. By 1944, acreage restrictions were removed, the price increased and the crops began to increase rapidly. By 1946, the harvested area was up to 65,680,000 ac., and the department of agriculture set a goal for 1947 at 71,000,000 ac. to be seeded; this was about the same area as was seeded for the 1946 harvest. The regional changes in wheat acreage after 1937 included a steady decline in the northwest, Pacific northwest and in the soft red winter or central wheat states. The south increased its wheat area steadily. In Kansas, the centre of wheat production in the United States, the decline was less in the western third of the state than in the eastern or central thirds. This was due primarily to the lack of competing crops.

The acre yield of U.S. wheat averaged higher in 1937-46 than for a long period previously: 16.2 bu. per ac. with two high years, 19.8 bu. in 1942 and 18.2 bu. in 1944. For the 30 years before 1937 the average yield had been 14.3 bu. per acre. Wide fluctuations, however, had ranged from a low of 11.3 bu. in 1933 to a top of 16.3 bu. in 1931. The high average during World War II was due to unusually favourable weather. This was also shown by the percentage of the seeded area abandoned, which was high in 1936 but declined steadily to 1946. Drought continued to be the greatest hazard for grain, but there were no serious droughts during the decade 1937-46. Losses from rust were not heavy after 1938. Floods caused some abandonment in 1941-43 in the central states. Winterkilling was also serious in 1933 but was not an important cause of loss after 1937. In general, favourable precipitation in the plains, particularly in Kansas, from 1940 on, maintained the high yields in these states. Some increases in yield recorded in certain areas were because of the use of better seed. Rust-resistant varieties with stiff straw gave good returns. Improved cultural methods also showed results. Summer fallow was beneficial in the hard winter and spring wheat regions. The use of commercial fertilizers increased in the central states, where wheat continued to be grown in rotation. The average size of wheat farms increased in the specialized areas. In the spring wheat belt they averaged 437 ac. in 1920 and 500 ac. in 1940. In the Pacific northwest, the average size increased from 727 ac. in 1920 to 1,134 ac. in 1940.

The chief changes in wheat farming came in the use of machinery. In the spring wheat belt, about 97% of farms used tractors and 71% had grain combines. In the hardwinter belt of Kansas and Nebraska, 75% had tractors and 80% used combines. The hours of labour per ac. declined accordingly. In the Kansas area, 8 hrs. per ac. were expended in 1909 and only 3.6 hrs. in 1936. On the wheat farms of the plains country, the amount of work stock in the form of horses and mules almost disappeared during World War II with the decline of animal-drawn machinery.

The total production of wheat averaged about 800,000,000 bu. from 1910 to 1944, ranging from a low of about 551,600,000 bu. in 1933 to a high of 1,008,000,000 bu. in 1915. During 1915–19 the crops had averaged 824,000,000 bu. from an average of 59,000,000 ac. During 1942–46, the crops averaged 1,035,000,000 bu. from 57,000,000 ac. Three 1,000,000,000-bushel crops were added to stocks which were at high-record levels in 1942 and 1943. No effort was made to increase wheat production until 1943.

The fear of great surpluses led to the drafting of a world wheat agreement between Britain, the chief buyer, and the United States, Canada, Australia and Argentina in 1942. Quotas of the amounts to be sold to Britain by the four exporters were set up and observed to a general extent. The Combined Food board directed allocations as the shipping problem changed.

The regional changes in U.S. wheat production were of importance in explaining the fluctuation of the crop. While the total U.S. crop increased after 1937, the output of the soft, red winter states of Iowa, Missouri east to Ohio

and Michigan, were declining in production. The greatest increases were in the hard-winter and spring belts, including the Dakotas, Nebraska, Kansas and Oklahoma in the plains. During the drought years 1933–36, production in the plains was extremely low—only 43% of the national total—while in 1941–44 the production in this area rose to 65% of U.S. production. The output of this area, and particularly Kansas, largely determined whether the national output would be high or low. The variations in the plains were due more to changes in yield than in acreage, and the yield in turn depended on the degree of precipitation. The nation was fortunate that the drought period which had struck this area regularly did not occur during the war period.

Hard winter wheat made up about 44% of the total acreage seeded in 1935–39; spring wheat 28%; soft red winter wheat 15%; Pacific 7% and all other east and south 6%. Of the spring wheat, only a small part was durum, nearly all of which was grown in the three states of Minnesota and the Dakotas. For the period 1935–44 the average amounts of each class of wheat were: hard red 359,476,000 bu.; soft red 200,727,000 bu.; hard red spring 158,979,000 bu.; durum 32,832,000 bu.; and white 91,678,000 bu., a total of 843,692,000 bu. Most of the increase during the war years was in the hard winter wheat. Durum amounted to 39,715,000 bu. in 1938 and increased to 44,600,000 bu. in 1942 but yielded only 35,600,000 bu. in 1946. Spring wheat was grown to a very limited extent outside of the northwest.

U.S. domestic wheat consumption was relatively stable, in contrast with production, and the surplus was used for export, feed or industrial purposes in varying degrees. The amount needed for the increasing population was less than the rate of rise in population since the per capita consumption declined with the expansion in the variety of foods produced. In 1937 the per capita consumption as food was down to 3.65 bu. from 3.94 bu. in 1930. The consumption declined further to 3.58 bu. in 1940, then turned upward to 4 bu. per capita in 1944. In 1937, 474,-644,000 bu. was consumed as food; 132,398,000 bu. as feed for livestock; 94,146,000 bu. for seed and only 39,000 bu. for industrial uses. This made a total of 701,227,000 bu. for domestic use. The rest of the crop of 1937 went into stocks for carry-over, which increased before 1938; about 103,000,000 bu. was exported as wheat and flour. The changes in wheat distribution brought about by World War II is shown by the uses made of the big 1944 crop. In the year 1944 food requirements took 558,869,000 bu.; feed 281,923,000 bu.; seed 80,830,000 bu.; and industrial uses, principally for industrial alcohol, 95,772,000 bu.; making a total of 1,017,394,000 bu. Exports were 138,900,000 bu., but stocks were low. The great increase in the use of wheat for livestock feed came in 1943, when the amount reached a high total of 480,000,000 bu., almost equal to the total wheat crops of some earlier years.

Wheat exports disappeared in 1935 and 1936, when the imports of flour more than offset the exports of grain. This was the period of real shortage of supply. In 1943, the balance was again in favour of imports, but this was due to the heavy food and feed utilization and the restrictions on shipping abroad. The July 1 stocks of wheat (carry-over) were dammed up in 1941–42 and 1943, and created larger reserves than had been seen for 30 years. In 1942, the carry-over was 632,103,000 bu. and in 1943, 621,659,000 bu. The big stock of 1943 was fed to livestock to balance the situation. The demand for wheat for relief in early 1946 became so strong that special efforts were made by the government to get more wheat delivered by

growers and to move stocks being held in grain elevators. Three orders were issued by the government, the first directing millers to use 80% of the grain in flour, the second limiting the use of wheat in mixed feeds and the third prohibiting the use of wheat to make alcohol or spirits.

It was estimated that 15,000,000 to 20,000,000 bu. of wheat were saved by the milling order, and about an equal amount by the restrictions on alcohol. The U.S. department of agriculture offered a bonus of 30 cents per bu. for wheat delivered between April 19 and May 25. On May 13, the ceiling price of wheat was raised 15 cents per bu. and other grain prices were adjusted accordingly. These actions resulted in a total of exports for the year ending June 30, 1946, at an all-time high of more than 400,000,000 bu. Exports in 1945 were 385,800,000 bu., the record to that year. At the same time, the stocks of wheat were down to 101,500,000 bu., the smallest in 20 years except for 1937, when stocks were down to 83,000,000 bu. because of the droughts. Prospects for another record crop of wheat in early May 1946 justified the government's shipping out the reserved stocks to a low point. World stocks of wheat were at a record peak of more than 1,700,-000,000 bu. in 1943, of which more than 1,200,000,000 bu.

were in the United States and Canada. The heavy war utilizations reduced this reserve rapidly until, in 1946, the world stocks were estimated at only about 400,000,000 bu., approximately the level of 1937 and the prewar period 1922-27.

The total use of wheat in the 1945–46 fiscal year was the largest in U.S. history, although it was only slightly more than 1943–44, when the large quantity was used for feed. The amount used for feed dropped to prewar levels in 1946, and the industrial use was down to 21,000,000 bu. The food consumption was down to 495,000,000 bu. compared with the 550,000,000 bu. used in 1944–45.

The distribution of exported wheat in the year ending June 30, 1946, included the following principal destinations: Europe 277,700,000 bu.; far east 33,400,000 bu.; Latin America 34,900,000 bu., and various other countries 39,800,000 bu. Of the amount shipped to Europe, 98,000,000 bu. went to the United Nations Relief and Rehabilitation administration; 56,700,000 bu. to the United States military civilian feeding; 52,600,000 bu. to France and French North Africa; 20,200,000 bu. to Belgium; 11,300,000 bu. to the Netherlands, and 11,400,000 bu. to Britain. In the far east, U.N.R.R.A. received 4,700,000 bu. and the U.S. military forces 16,600,000 bu. for civilian feeding. The total U.S. contribution to relief was estimated at about 200,000,000 bu. About 1,300,000 bu. went to the soviet union.

The price of U.S. wheat to growers advanced each year during the decade from a low of 56.2 cents per bu. in 1938. Prices had advanced from 39.1 cents per bu. in 1931 to \$1.025 per bu. in 1937, then declined with the increasing crops of 1937 and 1938. By 1942, the average price had recovered to \$1.098 per bu., slightly more than the 1937 level. It then moved up to \$1.42 per bu. in 1944. The average for 1945 was \$1.45 per bu. By April 1946, the farm price was \$1.58 per bu., or 99% of parity. As the ceiling was raised 15 cents in May 1946, prices continued to advance and by mid-1946 were reported at \$1.74 per bu., the highest since 1920. When price ceilings were removed, wheat prices advanced 5% to 10%, but the improved crop outlook held them in check. The movement of wheat became as large as shipping and storage facilities would allow, and in some areas open-air storage was resorted to. The world need for wheat was expected to extend through 1947, and the price advance was encouraged to direct grains into human food rather than livestock feed, since more people could be fed with the grain than from the livestock produced from the same amount of grain. When the Office of Price Administration was restored in Aug. 1946, price ceilings were put on meats, but grains were left free. It was recognized that this would produce less meat, but the policy was adopted for the purpose of conserving grain for human consumption. To assure more wheat for 1947, the national goal was set for 717,000,000 ac., the largest acreage since 1938.

The world wheat agreement planned for an export quota for the United States at 16% of the total amount to be exported by the big four wheat exporting countries. This was estimated to amount to from 64,000,000 to 80,000,000 bu. in the postwar years after 1947. During the period 1935-39, net exports averaged 42,000,000 bu. per year. With the increasing domestic use this was expected to take care of the U.S. surplus should the wheat area be reduced to the prewar level. The U.S. department of agriculture estimated that 64,000,000 ac. would yield 925,000,000 bu., which would care for maximum needs; there

would be no serious threat of surpluses. With a U.S. population of 146,000,000 in 1955, the need for wheat was estimated at 785,000,000 to 925,000,000 bu. including 60,000,000 to 80,000,000 bu. of exports. The use of wheat as a livestock feed was demonstrated to many farmers during World War II, and larger quantities could be used in years of surplus and low prices. Wheeler, Burton Kendall

Wheeler (1882—), U.S. politician, was born in Hudson, Mass., on Feb. 27, 1882. A graduate of the University of Michigan Law school (1905), he was admitted to the bar in Montana in 1906 and was a member of the Montana house of representatives (1911–13). After serving as district attorney for the state (1913–18), he ran unsuccessfully for governor in 1920 on the Non-Partisan league ticket. Two years later (1922), he was more successful in his campaigning for the U.S. senate, to which he was elected and was subsequently re-elected four times. Although generally a member of the Democratic party, he ran for vice-president of the U.S. on the Progressive ticket in 1924.

Wheeler was a strong supporter of President F. D. Roosevelt and New Deal measures until 1937, when he broke sharply with the president over the latter's plan to reorganize the supreme court, and was instrumental in defeating the measure. Subsequently, he voted with the farm bloc, although he gave active support also to pro-labour measures. Wheeler strongly disapproved the administration's foreign policy in the critical years preceding the U.S. entry into World War II and became an active leader of the U.S. noninterventionist group in 1941.

Senator Wheeler was favoured to win his bid for renomination for a fifth term in the senate in the Montana primaries and on July 11, 1946, Pres. Harry S. Truman threw his support to the Montana senator. However, the C.I.O.-P.A.C. withdrew its endorsement from the senator, charging that he was no longer a "liberal" and stumped for his opponent, Leif Erickson, who won the nomination on July 17, 1946.

Wheeler, Raymond Albert

Wheeler (1885—), U.S. army officer, was born in Peoria, Ill., on July 31, 1885, and was graduated from the U.S. Military Academy in 1911. He was graduated from the Command and General Staff school in 1927 and the Army War college in 1937. He served overseas in World War I, 1917–19, and later held a number of military engineering posts in the United States and Panamá. He became chief regional engineer for the Work Projects administration in Chicago, Ill., in 1935 and attended the Permanent International Association of Navigation congress in Brussels, Belgium, in 1936 as the U.S. delegate.

Following the outbreak of World War II, he was chief of the U.S. military mission to Iraq, Iran and India, 1941–42, with the task of speeding supplies to the soviet union and China. He was appointed to the staff of Lord Louis Mountbatten in the southeast Asia command in 1942, as director of supply forces. Promoted to the rank of a lieutenant general in 1944, he was named deputy commander of the southeast Asia theatre in Feb. 1944.

In June, 1945, he succeeded Gen. Daniel Sultan as commander of the India-Burma theatre. The following October he was sworn in as chief of the U.S. army engineers.

Wickard, Claude Raymond

Wickard (1893-), U.S. government official, was born Feb. 28, 1893, near Delphi, Indiana and was graduated from Purdue university in 1915. He was appointed to the Agricultural Adjustment administration in 1933 and later became director of the AAA's conservation program for the north central states.

Appointed undersecretary of agriculture on Feb. 1, 1940, Wickard was named by Pres. Roosevelt to succeed Henry A. Wallace as secretary of agriculture on Aug. 19, 1940. In March 1941, the new secretary took charge of the production and distribution of lend-lease food to Britain and her allies. On Dec. 6, 1942, he was appointed war food administrator with full control over the nation's food program.

Wickard was named "neutral chairman" of the United

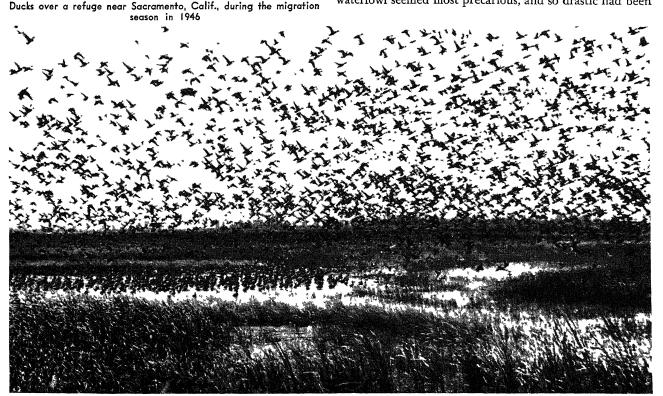

Nations war food board on Oct. 29, 1943. A little more than a month after he assumed office, Pres. Truman named Clinton P. Anderson as secretary of agriculture (May 23, 1945), and on July 2 of that year, Wickard assumed his new post as head of the Rural Electrification administration.

Wildlife Conservation

During the decade ending in 1946, wildlife conservation in the United States became more firmly established as a public policy than ever before. Disastrous results of a negligence that had led some conservationists to call wildlife "the forgotten resource" had, just before this decade, prodded not only conservationists but the general public into formulating and implementing a program to restore these resources. When preparations for war began to interfere with continuance of the program as planned, the evaluation demanded of all such enterprises resulted in general recognition that an abundant wildlife was an invaluable part of the American heritage, a resource upon which the "American way of living" was dependent.

Although World War II brought drastic curtailments in projects requiring materials and many man-hours, it was the occasion of a conscious treasuring of these resources. As a result, wartime exploitation was not as serious as had been feared (partly also because of the vigilance resulting from the fears); when postwar opportunities were being visualized, wildlife conservation was taken for granted as one of the national objectives. Furthermore, distracting as the prewar and war years had been for such long-time undertakings, there were many constructive developments upon which future progress could be based.

In 1937, at the beginning of the decade, the wildlife agency of the federal government reported a settling down to the more prosaic but essential task of carrying out the details of a national wildlife program. The condition of waterfowl seemed most precarious, and so drastic had been

the decline of these birds that public opinion was aroused. Out of the disaster of the waterfowl arose the national wildlife program.

The national program was in its simplest broad terms a co-ordination of measures to reduce and control the number of animals taken by hunters and to restore and preserve large areas of land and water for the increase of wildlife. These measures were based on the results of scientific investigation and intensified research, and they were fortified by widespread educational programs, both in schools and among the general public.

The program was best exemplified by its major component—the waterlowl restoration program. Most conspicuous in conservation discussions throughout these years were the ducks and geese. The outstanding species threatened by extermination was the trumpeter swan (see below). Being migratory birds, the waterfowl were protected by the federal government under international treaties with Canada and with Mexico. Their conservation was thus in a peculiar sense a national undertaking, and the resulting program developed was larger than any comparable program ever organized in any part of the world.

The restoration and preservation of wildlife lands resulted in a remarkable enlargement of the federal refuge system. Areas added either primarly or partly for the increase of waterfowl made up the most notable group of acquisitions, although other species of birds, and mammals also, were benefited. Including refuges of all kinds, the government reported in 1937 that at the beginning of the fiscal year (i.e., on July 1, 1936) there were 164 refuges, whereas at the close of the year (on June 30, 1937) there were 231. On July 1, 1935, there had been only 106. The refuge acquisition program thus begun continued throughout the following ten years (seriously impeded but not entirely interrupted by World War II) until by 1946 the refuges totalled 291 with an area of 17,819,495 ac. Acquisition was followed by developments that included both measures to restore or create national conditions favouring the wildlife and also the installation of buildings and other facilities for protecting and managing the areas, refuge managers and other personnel being established on most of them. This program from the start and throughout the ten years was under the direction of J. Clark Salyer, II, and was credited with a considerable part of the increase in wildlife, particularly waterfowl, noted until the great increase of hunting began in 1945.

Yet the critical factor in affecting waterfowl populations during the ten years was the restrictions on hunting determined annually by the federal government in accordance with hunting demands and investigations of the numbers of birds. At the end of the shooting season of 1937 the continental waterlowl numbers were estimated at 40,000,000 and the waterfowl hunters numbered 603,623. (In accordance with the Migratory Bird Hunting Stamp act of 1934 all hunters over 16 years of age were required to purchase a \$1 stamp-the "duck stamp," sales of which helped finance the refuge program and incidentally provided an index to hunting pressure). In 1938 the ducks increased to 50,000,000, the hunters to 783,039. In the three succeeding years duck numbers went to 57,000,000, to 65,000,000 and to 70,000,000, while the number of hunters was climbing to 1,002,715, to 1,111,561 and 1,257,-161. The upward surge of hunters reached 1,437,362 in 1942 and was then halted by the war, falling to 1,380,222 ın 1943 and 1,169,362 in 1944. In 1942 the duck numbers increased to 100,000,000, and when war brought not only

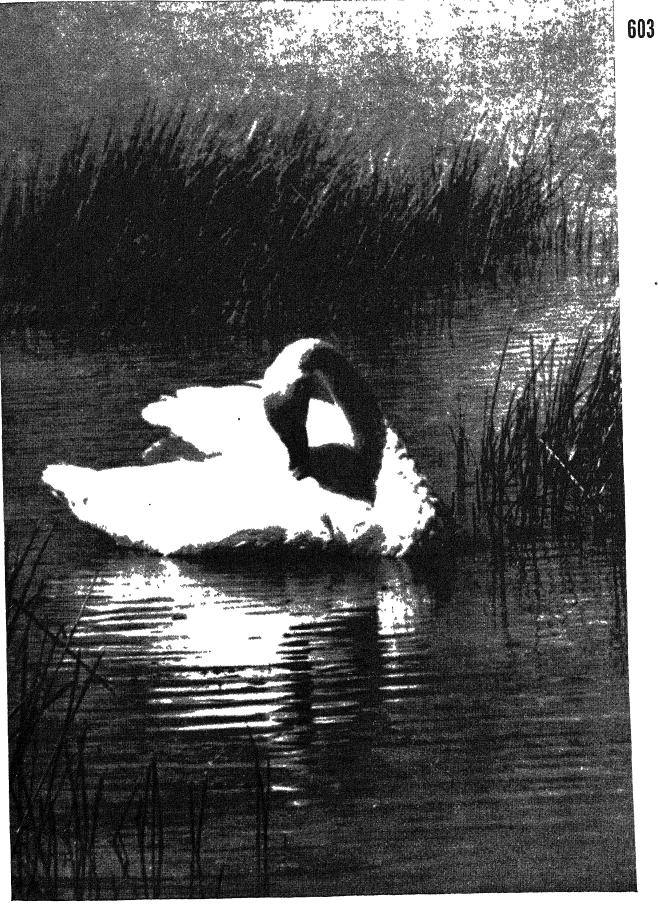

a decrease in hunters but also restrictions on gasoline, tires and ammunition, the duck increases continued to 120,000,000 in 1943 and reached a peak of 125,350,000 in 1944. By 1945, however, the number of hunters grew to 1,487,029 and the bird numbers started a decline to 105,500,000 that year and to only 80,000,000 in 1946, while later figures revealed a total of 1,686,368 waterfowl hunters—the largest number on record.

In 1937 the shooting season was limited to 30 days (in each of three transcontinental zones in the United States) and other restrictions were severe. During the succeeding years continued restrictions made possible the steady increase of birds. As bird populations grew, however, these restrictions were relaxed, until by 1945 the three seasons provided were for 80 days each. The 1946 waterlowl hunting seasons were reduced to 40 days in each of three zones; daily bag limits were reduced from 10 to 7; and the shooting days were ended a half-hour earlier. Albert M. Day, who became director of the fish and wildlife service on April 1, 1946, pointed out in June that "the only quick means of adjusting hunting pressure is provided through the annual hunting regulations." He made the following prediction: "In the years immediately ahead, the wild ducks and geese of this country are going to face the greatest army of hunters in all history. A declining period in waterfowl is all too plain. Increased hunting pressure is fact and not fiction. It is going to take the best kind of management possible to prevent further cuts into the breeding stocks of waterfowl."

Ostensibly there had thus occurred during these ten years a cycle from scarcity of waterfowl through relative abundance to a drastically declining population (reflected in a 36% decrease from 1944 to 1946), yet actually there was not apparent a return of the crisis of a previous decade, since the refuge system was in existence as a much enlarged area of special protection. Forecasts of increasingly severe hunting restrictions were received with less opposition than similar predictions in the 1930s, and waterfowl conservation, like all wildlife conservation, was more firmly established as a national policy.

* * ;

Conservationists during these years followed closely the reports on the trumpeter swan-largest American wildfowl, which in 1935 was apparently doomed to extermination in the United States, only 73 individuals being then known. Protected by every legal restriction possible on shooting, this species was also provided with a refuge-the Red Rock Lakes National Wildlife refuge in Montana-sometimes described as the trumpeter swan's refuge. This refuge was established on an area used by the few remaining trumpeter swans, an area not far from Yellowstone national park, where these birds also were completely protected and given special attention. Thus aided, the trumpeter swan began to win the battle against extinction. A report early in 1946 showed "at least 301 birds" in the United States in 1945-including 60 in Yellowstone national park and 163 on the Red Rock Lakes refuge. The remainder were scattered in the vicinity of these sanctuaries and on two other refuges to which a few swans were transplanted in 1939-the National Elk refuge in Wyoming and the Malheur National Wildlife refuge in Oregon. So tense was the interest in this bird that special annual counts

were made leading to reports that there were 114 in the United States in 1936, 168 in 1937, and in succeeding years 148, 199, 185, 211, 199, 221, 283 and finally 301 in 1945.

Game species in general during these years were not subject to the nation-wide co-ordinated protection afforded the migratory birds by the federal government, the protection of other species being the concern of the individual states. There was thus not available year-by-year data for all wildlife in the U.S. comparable with the estimates and statistics relating to waterfowl.

An understanding of conditions and trends among biggame animals was, however, made possible to a great extent by an annual inventory begun by the fish and wildlife service in 1937 on the basis of data from state and federal agencies. Counts were made while animals were on their winter range, as near to the last day of each calendar year as possible, although it was found better to wait till early spring for estimating the numbers of some species.

A variety of methods was adopted. Aeroplanes were used in many regions without heavy forest cover and proved successful with regard to deer, elk, caribou, antelope, bighorns, mountain goats and buffalo. Men on skis or snowshoes elsewhere made ground counts of deer, elk and antelope, and on horseback made buffalo estimates. High slopes frequented by bighorn sheep and mountain goats were reached on foot. Bears were sometimes counted on feeding grounds in parks, but elsewhere it was usually necessary to locate their dens or trace the bears by tracks and claw marks on trees.

The first of the inventories, compilation of data for the year 1937, resulted in an estimate of 5,044,000 big-game animals of 15 groups and races. The latest one completed at the end of the decade-that for 1943-suggested an increase to 7,148,422, although it was surmised that some of the apparent increase might have been because of improvements in making the estimates. Dr. Hartley H. T. Jackson, who conducted the inventories, analyzed the trends during the first five years in Big-Game Resources of the United States: 1937-1942, published in 1944 as Research Report 8 of the fish and wildlife service. "At the close of the 5-year period," he wrote, "three species seemed to be in a precarious status. The number of moose had decreased throughout the United States 11.3 percent since 1937, and that of bighorn sheep 14.6 percent. The grizzly bear population had increased 12.1 percent; nevertheless, it is in constant danger of extirpation in the United States outside of national parks. The prong-horned antelope showed an increase of 51.6 percent in numbers over those of 1937; black bear, 45.1 percent; elk, 42.8 percent; deer, 30 percent; peccary, 23.8 percent; mountain goat, 23.6 percent; and American bison, 21.4 percent. Big game as a whole increased 30.8 percent."

A basis for detailed estimates of other game species throughout the country was not available, yet there were good grounds for concluding that the ten years had been a period of improvement in general game conditions as a result of the Federal Aid to Wildlife Restoration act of 1937. This act, designed primarily to increase and improve conservation work by the states, authorized a federal grant to any state which had enacted certain legislative measures to promote conservation. By 1946, 47 states were thus participating and receiving grants for purchasing and developing lands and for conducting research in wildlife management; the federal government paying 75% and the

state 25% of the costs of the authorized projects-conducted in accordance with federal standards.

Two international agreements consummated during these years not only involved the United States further in conservation as a hemisphere concern but also established its own national policies more firmly. On March 15, 1937, the United States and Mexico exchanged ratifications and proclaimed a convention for protecting migratory birds and regulating shipments of game mammals between the two countries. On May 1, 1942, the Convention on Nature Protection and Wild Life Preservation in the Western Hemisphere became effective. One of the proposals of this convention was "to protect and preserve in their natural habitat representatives of all species and genera of the native fauna and flora" of the contracting states, "including migratory birds, in sufficient numbers and over areas extensive enough to assure them from becoming extinct through any agency within man's control."

There continued throughout these years a widening interest in song birds, in the birds noted for their plumage, and in wildlife in general for its own sake—an interest stimulated and served by such organizations as the National Audubon society and such magazines as Nature. Such general conservation organizations and publications prospered during the decade and continued in the war years to serve the U.S. through their influence for conservation, the circulation demand of the periodicals actually increasing beyond the wartime limitations on the use of paper.

Two significant general developments were the increased emphasis on the technology of wildlife management and the keener recognition that land-use management was of critical importance in wildlife management.

The intensified and enlarged public programs for wildlife restoration—both federal and state—were accompanied by a greatly increased demand for wildlife-management technologists. At the same time it was more generally recognized that sound conservation programs could be realized only by basing them on research. The annual publications of the proceedings of the North American wildlife conferences were, for example, to a great extent compilations of technical or semitechnical papers. A new organization of professional personnel, the Wildlife society, successfully established the Journal of Wildlife Management, and such earlier scientific publications as the Journal of Mammalogy and The Auk (ornithology) published much that was pertinent to wildlife management and conservation. Research units for the development of trained personnel (as well as for the prosecution of needed studies) were maintained at ten land-grant colleges, and training at other colleges and universities was further developed. So important, in fact, had science and special training become in wildlife conservation that Ira N. Gabrielson, director of the fish and wildlife service in 1945, called the loss of trained personnel the "most serious effect of the war on the conservation of United States animal resources."

Assuming of course a proper regulation of hunting, wild-life conservationists came more and more to see their central problem as largely one of land management. National parks, national forests and similar state areas were ranked with wildlife refuges. Establishment of a new conservation organization, the Wilderness society, for the preservation of wilderness and wild areas, was supported by many wild-life conservationists. The Committee on Bird Protection of the American Ornithologists' union in its report for 1944 pointed out that the ornithologist's "objective is a kind of conservation which assumes that land comes first and that its proper use must be the basis of all conservation."

Public law 732 enacted by the 79th congress made it

mandatory to have biological surveys made and reports thereon prepared, before multiple purpose or other high dams could be constructed or major diversions of water effected.

Pollution control was vigorously demanded, and an anti-pollution measure prepared by the house committee on rivers and harbours on the basis of three earlier bills was reported to congress, but failed to be enacted. At the close of 1946 the Izaak Walton league was mobilizing support for a similar measure to be introduced in the 80th congress. Thus in many ways the wildlife problem was recognized as one of providing suitable environment; this aspect of conservation seemed destined to be of increasing importance.

BIBLIOGRAPHY.—The best source of brief but critical information regarding publications on wildlife conservation during this ten-year period is in the files of the fish and wildlife service's Wildlife Review authoritatively prepared by W. L. McAtee as a listing and critical annotation of books, articles in journals, and other publications. See also A. F. Gustafson, C. H. Guise, W. J. Hamilton, Jr., and H. Ries, Conservation in the United States (1939, revised 1944); Margaret Morse Nice, The Watcher at the Nest (1939); Ira N. Gabrielson, Wildlife Conservation, (1941) and Wildlife Refuges, (1942); Fading Trails: The Story of Endangered American Wildlife, by a committee from the National Park Service and the Fish and Wildlife Service, edited by Charles Elliott (1942). (H. Z.)

Other Countries.—In 1938 a conference met in London, England, to take stock of progress in the implementation of the convention for the conservation of the fauna and flora of Africa, signed in 1933, and to consider further measures of protection. The progress reported was not, except in the case of the Belgian Congo, remarkable, but the existence of the conference proved that the question of conservation was occupying the minds of the signatory governments. Various provisional agreements were reached for the purpose of making the convention more effective and it was agreed that the conference should reassemble in 1939 concurrently with a projected wider conference, which was to consider the extension of the protection afforded by the existing convention to the flora and fauna of tropical Asia and the western Pacific. Owing to the outbreak of World War II, neither conference materialized.

The incidence of war was inevitably prejudicial to the conservation of wildlife in many parts of Africa and in Europe. One important species, the magnificent European bison, almost certainly suffered through the war. This animal had been present in considerable numbers before World War I in the Russian forests, protected as hunting grounds of the tsars; during that war its numbers were already very seriously reduced by marauding soldiers and poachers, so that in 1939, in spite of the activities of an international society for their protection, there were no more than approximately 100 in existence, of which about 30 were in the forest of Bialowieza, Lithuania, and about 30 in Germany. On the whole the species survived World War II better than was to be expected. A group of 13 in Germany was protected by the British control commission; another 23 were reported to be in the Bialowieza forest under Russian protection. Other small groups and individuals survived in various zoos in Sweden and elsewhere and in England a herd of 21 was kept in the duke of Bedford's park at Woburn. Because of the tendency of the species to breed a preponderant number of males, however, the existing remnant was still in some danger of eventual extinction.

In British Africa the conservation of wildlife suffered a very serious setback in World War II. Not only did the conditions of war deplete the staffs of the various colonial game departments, so that the enforcement of the laws and ordinances for the protection of wildlife were weakened, but also in various territories—notably in Southern Rhodesia and in part of South Africa—a policy of game slaughter was enforced in the belief that, by this means, the disease-bearing tsetse fly could be eradicated or controlled. The officially published figures of the numbers of animals slaughtered in Southern Rhodesia were alarming: in 1945 more than 28,000 head were lost. It was by no means certain that such measures would have the effect desired, or that competent organized scientific research would not reveal other means for controlling the tsetse fly menace; yet the ideas underlying the slaughter policy were gaining ground in other territories.

It was widely feared that, as a result of the Japanese invasion and occupation, the wildlife of Malaya and of the Netherlands East Indies would be seriously threatened. According to reports received by 1946, however, it appeared that, in Malaya at least, the position had not deteriorated and might rather have improved because of the strictly-enforced Japanese embargo on the carrying of firearms of any description.

Wilhelmina

Queen Wilhelmina (Wilhelmina Helena Pauline Maria of Orange-Nassau) (1880—), of the Netherlands, was born Aug. 31, 1880, the daughter of King William III of the Netherlands and Queen Emma. Succeeding to the throne in 1890, she ruled under the regency of her mother until 1898 when, at the age of 18, she was formally enthroned. She married Henry, duke of Mecklenburg-Schwerin in 1901 and in 1909 Crown Princess Juliana was born. Prince Consort Henry died in 1934.

The queen successfully steered her country along a path of absolute neutrality during World War I (1914–18), but the Netherlands' efforts to remain neutral during World War II were frustrated by the German invasion of May 10, 1940; the royal family fled to London for refuge. The queen proclaimed on May 13, 1940, that the seat of the Netherlands government had been transferred to London; Netherlands forces carried on the war from there until the liberation of the country.

As the war in Europe was drawing to a close, the queen took up residence near Breda, in April 1945, and moved to the royal palace at The Hague, July 7, 1945. On Dec. 25, 1946, she proclaimed the existence of the provisional state of East Indonesia, comprised of all of the Netherlands Indies east of Java and Borneo, excepting New Guinea.

Wilkinson, Ellen C.

Miss Wilkinson (1891–1947), British member of parliament, was born in Manchester, England. The daughter of a millworker, she won a scholarship at the University of Manchester, where she obtained her master of arts degree. Upon completion of her studies she became a trade union

organizer. An early advocate of women's suffrage, she organized the National Union of Women's Suffrage in 1913 and she was elected in 1924 as Labour member for Middlesbrough, one of the few women ever elected to the British parliament. Miss Wilkinson was returned to commons in 1935 as Labour member for Jarrow and later agitated in parliament for more effective relief for the unemployed in that shipbuilding community. She was made parliamentary secretary to the ministry of pensions in the Churchill coalition government in May 1940, but left this post a few months later to join the ministry of home security in order to assist in providing food and shelter for bombed out Londoners. Early in 1945, she was made a member of the privy council, and in April she attended the San Francisco conference of the United Nations as a member of the British delegation. After Prime Minister Attlee formed the Labour government (July 26, 1945), he appointed Miss Wilkinson to the post of minister of education. At the opening session in London of the United Nations education conference, Nov. 1, 1945, she was elected president of the parley. She was also one of the British delegates to the United Nations general assembly sessions that opened in London Jan. 10, 1946. Miss Wilkinson died Feb. 6, 1947, at London.

Willkie, Wendell Lewis

Willkie (1892–1944), U.S. politician and business executive, was born Feb. 18, 1892, in Elwood, Ind. After graduating from the University of Indiana with an A.B. degree in 1913, he taught history in the high school at Coffeyville, Kan., and attended Oberlin college for a short time in 1915; he then became a laboratory assistant in a Puerto Rican sugar plant. In 1916 he received his law degree from the University of Indiana and joined his father's law firm in Elwood. On the day in 1917 that the U.S. entered World War I, Willkie enlisted; in France he became a captain in the 325th field artillery and after the armistice he continued in service to act as counsel for enlisted men who had been court-martialled. Meanwhile, on Jan. 14, 1918, he had married Edith Wilk of Rushville, Ind.

Back in civilian life, Willkie worked for a short time in the legal department of the Firestone Tire and Rubber company in Akron, O., then joined the law firm of Mather and Nesbitt in that city. Among Willkie's legal clients was an Ohio utilities company, and through this relationship he was persuaded in 1929 to go to New York city as a member of the legal staff of Commonwealth and Southern, a large utilities holding company with operating units in 11 states. Four years later he was president of the company. In this \$75,000-a-yr. office he more than doubled the amount of electricity sold by the company. He also entered into a controversy with the Tennessee Valley authority (which had set up extensive power developments in competition with Commonwealth and Southern) and attracted national notice and considerable sympathy for the cause of public utilities. Always ready to concede the need for proper control of utilities, he presented his arguments against excessive governmental regulation in such a logical manner that he became known, in the words of one publication, as the "most articulate" of the New Deal's critics, and, by 1939, as a potential candidate for president.

He was nominated for the presidency by the Republican convention June 28, 1940, in the face of much opposition by regular politicians. (See REPUBLICAN PARTY and ELECTIONS.) His campaign was an unusually active one. Although he was defeated by a substantial margin in the

election of Nov. 5, 1940, the 22,333,801 votes cast for him exceeded the largest number ever cast for a presidential candidate except Franklin D. Roosevelt. After the election, Willkie retired to private life (he had resigned as president of Commonwealth and Southern) and issued a call to his followers to co-operate in national unity.

At the request of Pres. Roosevelt he became the latter's special emissary and toured England, the middle east, the U.S.S.R. and China in 1941–42. His book, One World, the story of this trip, pleaded for postwar co-operation among all nations. While Willkie criticized Roosevelt's domestic policies, he urged the Republican party to support the president in the war effort. This appeal and his views on international co-operation alienated the G.O.P. leaders, and they opposed his efforts to obtain the Republican nomination for president in the 1944 campaign. Willkie struggled against the tide, but after his overwhelming defeat in the Wisconsin primaries in April, he withdrew from the race. He died of coronary thrombosis in New York city, Oct. 8, 1944.

Wilson, Charles Edward

Wilson (1886—), U.S. industrialist, was born Nov. 18, 1886, in New York city. At the age of 12, he went to work as a shipping clerk with the General Electric company, later becoming a factory manager and assistant superintendent. He became executive vice-president of General Electric in 1937 and president Jan. 1, 1940.

Wilson was selected by Chairman Donald Nelson for the post of War Production board vice-chairman in full charge of production, Sept. 17, 1942, and the following December was made chairman of WPB's Production Executive committee. On Dec. 1, 1942, he was also made chairman of the U.S.-Canada Joint War Production committee, succeeding James S. Knowlson.

Soon a policy dispute over control of production and materials developed between Wilson and Ferdinand Eberstadt, vice-chairman in charge of materials. Chairman Nelson resolved the dispute in Feb. 1943 by removing Eberstadt and transferring his functions to Wilson, who shortly thereafter became executive vice-chairman.

Wilson resigned in Aug. 1943 in protest against "a campaign of vilification" picturing him as an exponent of big business in plans for postwar reconversion. President F. D. Roosevelt, in accepting the resignation, lauded Wilson for "outstanding service" to the nation.

Wilson, 1st Baron

Baron Wilson of Libya and of Stowlangtoft (Henry Maitland Wilson) (1881———), British army officer, was born Sept. 5, 1881, at Stowlangtoft hall in the county of Suffolk. Educated at Eton and the Royal Military college at Sandhurst, he joined a rifle brigade in 1899 and served in the Boer War (1899–1902). During World War I, he served in France (1914–17), was cited three times and received the distinguished service order.

Promoted to lieutenant general in 1939, Wilson was made commander of the British army of the Nile. He organized the western desert defenses and, under Gen. Archibald Wavell's direction, led the drive that swept Rodolfo Graziani's Italian armies out of Cyrenaica. Gen. Wilson was then made commander in chief and military governor of Cyrenaica. In 1940 he commanded British troops in the ill-fated Greek campaign and he also directed Allied armies that won Syria (June–July 1941). He was appointed commander of the Iran-Iraq theatre in Aug. 1942.

Returning to Egypt in Feb. 1943 as commander in chief

of the middle east, he was appointed supreme allied commander in the Mediterranean theatre in December of that year. On Nov. 26, 1944, he was appointed head of the British joint staff mission in Washington and was elevated to the rank of field marshal on Dec. 29, 1944. He was elevated to the peerage March 12, 1946, as 1st Baron Wilson of Libya and of Stowlangtoft. On Oct. 9, 1946, Lord Wilson was succeeded in his post as British army member of the joint staff mission by Lt. Gen. Sir William D. Morgan.

Winant, John Gilbert

Winant (1889—), U.S. diplomat, was born on Feb. 23, 1889, in New York city. He studied at Princeton university, Princeton, N.J., and in 1912 joined the faculty of St. Paul's school as a teacher of English and assistant rector. He entered the U.S. army during World War I, becoming captain of the 8th air observation squadron in France. After the war he was elected to the New Hampshire legislature, serving in both the lower and upper houses between 1917 and 1923.

He was governor of New Hampshire in 1925-26 and from 1931 to 1934.

Winant joined the International Labour organization in 1935, serving as assistant director and then director. In 1941 he was appointed ambassador to Great Britain by President Roosevelt. In Dec. 1944 he submitted to the British, French and soviet governments a detailed U.S. proposal for shaping the postwar economy of the reich.

On Jan. 12, 1946, Winant was appointed as U.S. representative on the United Nations Economic and Social council.

He held this post concurrently with his position as ambassador until March 23, 1946, when he was succeeded as ambassador by W. Averell Harriman.

Windsor, Duchess of

The duchess of Windsor (1896-), was born June 19, 1896, in Monterey, Pa., as Bessie Wallace Warfield, daughter of Mr. and Mrs. Wallis Warfield. In 1916, when she was 20, Miss Warfield was married to Lieut. E. Winfield Spencer, whom she divorced in 1931. A year later, she married Ernest Simpson, a well-to-do London broker. Some time later she met the prince of Wales and on Oct. 27, 1936, she was granted an uncontested divorce from Simpson. While waiting for her divorce decree, the prince, who had become King Edward VIII, had announced to the cabinet his intention of marrying Mrs. Simpson. The marriage was opposed by Prime Minister Stanley Baldwin and other high British dignitaries. At the height of the crisis, marked by the king's insistence and the government's unalterable opposition to the marriage, Mrs. Simpson offered on Dec. 8, 1936, "to withdraw from a situation that had been rendered both unhappy and untenable." However, the king decided to reject the throne and on Dec. 11, 1936, abdicated and assumed the title duke of Windsor.

Baldwin subsequently prohibited any official recognition of the duke's forthcoming marriage, and the archbishop of Canterbury declined to authorize a Church of England ceremony on the grounds that the bride was a divorcee. The Baldwin government also issued a decree forbidding the American woman and "her descendants if any" from any right to the title of "Royal Highness." They were married June 3, 1937, in the Chateau de Candé in Monts, France. After a trip to Austria, they took up residence in France.

After the start of World War II, she went in Aug. 1940 to Nassau with her husband who had become governor of the Bahamas. After the war they returned to France.

Windsor, Edward, H.R.H., The Duke of

The duke of Windsor (1894-), who reigned for 46 weeks and 4 days in 1936 as King Edward VIII of England, was born June 23, 1894, at White Lodge, Richmond Park, England, the first child of King George V and Queen Mary, who at the time were the duke and duchess of York. He was baptized Edward Albert Christian George Andrew Patrick David. He was sent to Osborne, a naval preparatory college, in 1907 and two years later entered the Royal Naval college at Dartmouth. On completing his training at Dartmouth in July 1911, he was invested prince of Wales and earl of Chester. He entered Magdalen college, Oxford, 1912, but left the university upon the outbreak of World War I in 1914 and was gazetted to the Grenadier Guards in Aug. 1914. He served as aide-de-camp to Sir John French for 18 months on the western front; later he was on the staff of the general officer commanding the Mediterranean expeditionary force. After the war the prince visited Canada and the United States in 1919, Australia and New Zealand in 1920, India and Japan in 1921-22 and British possessions and dominions in Africa and South America in 1925.

On Jan. 20, 1936, George V died and the prince of Wales ascended the throne as King Edward VIII. In the summer of that year gossip connected the king's name with that of Mrs. Wallis Warfield Simpson. In October and November Prime Minister Stanley Baldwin conferred with the king on the issue and was informed by Edward that he intended to marry Mrs. Simpson. Baldwin objected to the marriage, not because of Mrs. Simpson's status as a commoner or an American, but because she already had been twice divorced. (Mrs. Simpson had obtained a decree nisi, Oct. 27, 1936.) Given a choice between his proposed marriage and the crown, Edward chose the former, abdicating, Dec. 11, 1936, in favour of his brother, the duke of York, who became King George VI.

Taking the title of duke of Windsor, he married Mrs. Simpson in a ceremony at the Chateau de Candé, Monts, France, on June 3, 1937.

On Sept. 12, 1939, nine days after the outbreak of World War II, the duke returned to England for a brief family reunion. He returned to France Sept. 22 as liaison officer between the British and French armies. After the Germans began to overrun France in June 1940, the Windsors fled to Spain and thence to Portugal. He was later appointed governor and commander in chief of the Bahamas, assuming this post in Aug. 1940. The duke resigned in March 1945.

Wines

In spite of wars and other catastrophes, the hardy vine continued to survive during the decade 1937–46 and to produce its grapes which the indefatigable vignerons of the world pressed into wine. Viticulture continued to give a direct livelihood to 30,000,000 people in Europe alone. The violence and scope of World War II, however, naturally dislocated every phase of normal trade and production. The true extent of the damage was not known, as it was impossible to obtain exact statistics from all the wine-producing regions of the world.

Algeria.—France had always counted on Algeria to supplement its own wine harvest and to make up the differ-

ence between its production and the consumption of the French people. Conditions in Algeria deteriorated rapidly after 1940, and the yield dropped from an average of well over 400,000,000 gal. per year to about 250,000,000 gal. in 1945. Efforts were made after the end of the war to increase production, but several years would be required before normal harvests were again possible.

Argentina.—Unaffected by the rigours of war, Argentine production was maintained at approximately the normal 200,000,000 gal. annually. The 1945 vintage was somewhat less, because of early frost and mildew, but this was offset by substantial carry-overs from the previous vintages. Consumption of wine in Argentina increased steadily until by 1946 it exceeded 12 gal. per capita as compared to less than 1 gal. in the U.S. Quality-wise, Argentina steadily improved its wines. An important contributing factor was the increasing amount of bottled wine shipped from the wineries in Mendoza, San Juan and Rio Negro to the distributing centres of the country. By 1946, this amounted to nearly 50% of the wine as opposed to the former system of shipping almost everything in wood for bottling by the retail establishments. As usual, the wines of Argentina did not vary greatly in quality from one vintage to another.

Australia.-Although Australia was deeply involved in World War II from Sept. 1939 onward, production and consumption of wine was maintained at a fairly normal rate until 1945, when there was a disastrous vintage in quantity although excellent in quality. Normal and even increased consumption was aided by the fact that the government placed restrictions on the consumption of beer and spirits so that the loss of Australia's foreign markets was more than made up for by its increased home consumption. By 1946, Australia found itself with an actual shortage of wine, but with the lifting of restrictions on beer and spirits it hoped to find itself in a position to resume its flourishing prewar export trade. During the decade 1937-46, fair to good wines were produced every year, with wines of exceptional quality being produced in South Australia in 1945 and wines of vintage quality being produced in the Hunter river district in 1940.

Chile.-Viticulturally, Chile was still perhaps the most favoured nation in the world insofar as climatic conditions were concerned. It also remained unique in possessing the only vineyards in the world that had never known the ravages of the phylloxera. Production of wine increased to such a point that the government restricted the amount of wine which could be marketed, to prevent excessive consumption on the part of the poor people. All excess production had to be distilled for industrial purposes or exported. The principal European grape varieties were cultivated, and wines of excellent quality were obtained. A large export market was developed; after the war, Chile's exports to its neighbouring South American countries, to the U.S. and to Europe increased substantially. Among its outstanding wines were Riesling and Sauterne among the white wines, and a full-bodied red wine of the Burgundy

France.—Traditionally the largest producer and consumer of wines in the world, France probably suffered most during the war period. In no way could this be demonstrated better than by the fact that wine was rationed in France, each person receiving only one litre (just over a quart) per month, a quantity normally consumed in two or three days. From 1935 to 1939, the average production of wine in France was 1,468,160,000 gal., with the 1939 vintage 1,796,371,000 gal. In 1945, the first peacetime vintage after

liberation was only 661,494,000 gal., almost 1,000,000,000 gal. less than the 1939 vintage and about 45% of the normal production. The reasons for this decline were several: (1) Lack of manpower to care for the vineyards; France's men were prisoners of war or in forced labour battalions in Germany; (2) vines too old or diseased could not be replaced when they died, partly for the previous reason; (3) copper sulphate and other disease-combating sprays and chemicals were not available, and vines that could have been saved were lost. It was estimated that more than 10,-000,000 vines had to be planted, in addition to the normal annual replantings, before France's vineyards could be brought back to prewar production. It was economically impossible to do this at once, and at least 10 years would pass before the total number of vines in production approached the prewar figure. The resulting short production, in addition to inflation, naturally caused huge increases in price. France's large prewar export trade in wines was adversely affected.

Even though the Germans requisitioned substantial quantities of fine wines, they were unable to carry off much of what they wanted because of lack of transport facilities. Therefore, excellent stocks of very fine wines still remained in France. From a quality standpoint, the vintages of 1937, 1943 and 1945 were outstanding for all wines. In addition to these years, very good wines were produced in the Bordeaux region in 1940, 1942 and 1944, while in the Champagne region, excellent wines were produced in 1938, 1941 and 1942. It should be noted that the 1945 vintage promised to be the finest of the 20th century up to that year.

Germany.—For obvious reasons, it was not possible to obtain satisfactory information regarding production of wines in Germany. The situation was further confused because of the fact that part of the Rhine-Moselle wine-growing regions lay in the French zone of occupation, while the rest lay in the U.S. zone. With regard to quality, the outstanding vintages of the decade were 1937, 1943 and 1945, with 1942 and 1944 producing very good wines as well.

Greece.—Exact production figures from 1939 onward were unobtainable. However, it was estimated that production averaged between 50,000,000 and 80,000,000 gal. per yr. The German and Italian occupational forces seized large quantities of wines which were shipped to Germany and Italy; because of lack of other vitamin-containing foods, a large quantity of the grapes produced in Greece was consumed by the Greek people to replace bread and other vital foods which they did not have. Further, because of lack of disease-combating chemicals and sprays, many of the vineyards suffered. In Greece, as in France, it was economically impossible for the vineyard owners to bring their plantings up to prewar par for a number of years.

Hungary.—No definite information was obtainable regarding Hungary's wine production after 1939, other than the fact that wine continued to be an important part of Hungary's agriculture. The 1945 vintage, as in the rest of Europe, was very favourable from a quality point of view. The quantity produced was estimated to be about 4,000,000 hectolitres (105,671,000 gal.). In the Tokajhegyalja, the weather was favourable for the drying of the grapes on the vine, so that it was possible to produce better than average quantities of the rich, sweet Aszu Tokaji wines.

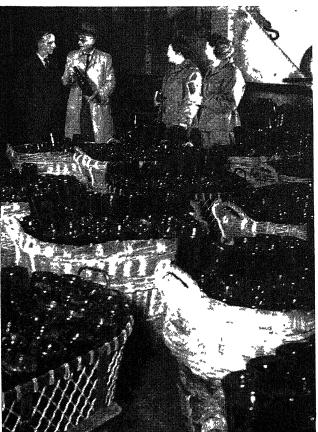

Italy.—Wine production in Italy during the war years suffered a slowdown resulting from lack of manpower and from destruction by phylloxera, which, far from diminishing, reached a greater intensity because of prolonged dry spells and the scarcity of irrigation which could not be

properly carried on. In many zones where actual battles raged, hardly a trace of the vines remained. The arduous campaigns fought on the Italian peninsula ravaged many of the vineyards, and no actual census was made. It appeared that the most heavily-damaged parts of Italy were in Tuscany and Emilia, where some of the best wines of Italy were produced, particularly Chianti from Tuscany. However, the vineyards of Apulia seemed to have suffered little or no damage. This region of Italy produces the largest quantity of wine, although very few of the wines reach the export market; they are either consumed in Italy or reach foreign markets in the form of vermouth. There are less violent variations in climatic conditions in Italy from year to year than in other European wine-producing regions, and for that reason vintages are more uniform.

Palestine.—The art of viticulture had been practiced in Palestine since prebiblical times, and all references to wine in the Bible are to the wines produced in Palestine. For many centuries, however, viticulture was neglected, and it was only re-established on a commercial basis in 1882 by Baron Edmond de Rothschild of Paris, who installed a modern plant and large cellars.

Cultivation of the vine in Palestine made its most outstanding progress during the ten years preceding 1946; production more than doubled from the 61,574,000 gal. produced in 1936 to an average of 140,000,000 gal. produced in 1944 and in 1945, largely because of the increase in labour made possible by the influx of refugees from western Europe. Whereas prior to 1936 the wines produced were labelled port, malaga, sherry, tokay, etc., the tendency developed after that year to label wine with Palestinian names such as Kallia, Adom Atik, etc., the object being to

Champagne stored in wicker baskets in a French wine cellar where U.S. troops of liberation found it in 1944. The proprietor is shown talking shop as two U.S. army nurses look on

cease the selling of Palestinian wines under foreign names and to endeavour to develop the world markets on the basis of the original Hebrew names. Because of the eventempered climate there is very little variation in quality among vintages.

Portugal.—Physically untouched by the ravages of war, Portugal had the good fortune to be favoured with several of its most abundant vintages at the very moment when there was the greatest demand for its wine in export markets. The country of the Lusitanians has perhaps some of the most uneven climate of Europe; there were such wide variations in production figures as 126,809,000 gal. in 1940 and 344,995,000 gal. in 1944. The U.S. alone, normally importing about 125,000 gal. of wine from Portugal, imported 1,763,326 gal. in 1943 and 3,861,718 gal. in 1944. These abnormal importations of Portuguese wines by the U.S. were due to the fact that its normal sources of supply were cut off because of occupation by the axis nations, and the production of spirits in the U.S. was greatly curtailed because of the entire use of distilling facilities for the war effort.

The 1938, 1940, 1942, 1944 and 1945 Portuguese wines were good. Of these, the 1938 and 1940 wines were bottled as vintage wines; the 1942 was good enough to be declared a vintage, and the 1944 or 1945 probably would be shipped as a vintage wine.

Spain.—Official production figures after the 1941 vintage were unobtainable, but presumably they were about 400,000,000 gal. on the average. Spain, too, was untouched by the physical aspects of World War II. During the Civil War of 1936–39, little fighting took place in the principal export wine-producing region, in and about Jerez, where sherry is produced. Like Portugal, Spain's exports to the U.S. enjoyed an unprecedented increase during 1943 and 1944, when they totalled 1,264,215 gal. and 2,392,715 gal. respectively, as compared to a normal shipment of approximately 500,000 gal. The importation of table wines from Spain also increased by 600% to 700% during 1943–44.

The relative merits of one sherry vintage as compared to another have only minor importance because of the fact that all commercial sherry is produced by the Solera system of continual blending.

Union of South Africa.—No great change was noted in the production figures of the vineyards of the Union of South Africa, probably because of the fact that the export market remained small. The principal market was still England, where wines labelled Empire Claret, Empire Burgundy, etc., continued to be shipped. South African wines generally have a spicy quality and are quite full-bodied.

United States.—The vine is cultivated in all 48 states of the union; commercial wine making in 1946 was practised in 27. California's soil and climate were found to be so suitable to wine-producing grape culture that it accounted for more than 90% of the wine made in the U.S. New York and Ohio remained the most important producers among the other states.

Wine production on a commercial basis was resumed in 1933 after 14 years of prohibition. In the first few years it was inevitable that large quantities of wines had to be made from grape varieties better suited for eating or drying. Great strides were made in the replanting of vine-yards to wine-producing varieties, but with the advent of World War II, this program suffered a setback, because of the government requirements of vast tonnages of raisins, which were found to be one of the best concentrated vitaminous rations for troops.

Wine production in the U.S. had a difficult time keeping ahead of consumption. Whereas in 1936 about 52,000,ooo gal. were produced, consumption was more than 60,-000,000 gal. The peak of consumption was reached in 1941 and 1942, with taxpaid figures of 101,674,303 gal. and 113,-270,677 gal. respectively. Consumption figures fell off somewhat during the war years. This was due to a series of causes, such as shortage of supply, the order to produce raisins for the war effort, shortages of labour, bottles and cartons and transportation difficulties. The lifting of the restrictions of the grape order was immediately reflected in an increase of more than 30% in production in the 1945 vintage. The marketing of wine was aggressively pursued by the California producers. A national advertising program was conducted under the supervision of the Calitornia Wine Advisory board.

American wine producers continued their efforts to offer wines so crystal bright that they would never have any sediment. This sedimentation can be prevented by pasteurizing, and a vast majority of the wines produced in the U.S. are so treated, but when a wine is pasteurized, almost all its character is lost. Nevertheless, distinguished wines were produced in the U.S. (See also Liquors, Alcoholic.)

Wisconsin

One of the north central states, Wisconsin, popularly known as the "Badger state," was admitted to the union in 1848. Area, 56,154 sq.mi., including 1,439 sq.mi. of water. Population (1940) 3,137,587, of which 1,679,144 were urban and 1,458,443 rural. Only 24,835 were nonwhite. Foreign-born whites numbered 288,774. On July 1, 1944, the bureau of census estimated the population of the state at 2,975,910. Capital, Madison (pop. 1940, 67,447). The largest city is Milwaukee with a population of 587,472. Other cities: Racine (67,195); Kenosha (48,765); Green Bay (46,235); La Crosse (42,707); and Sheboygan (40,638).

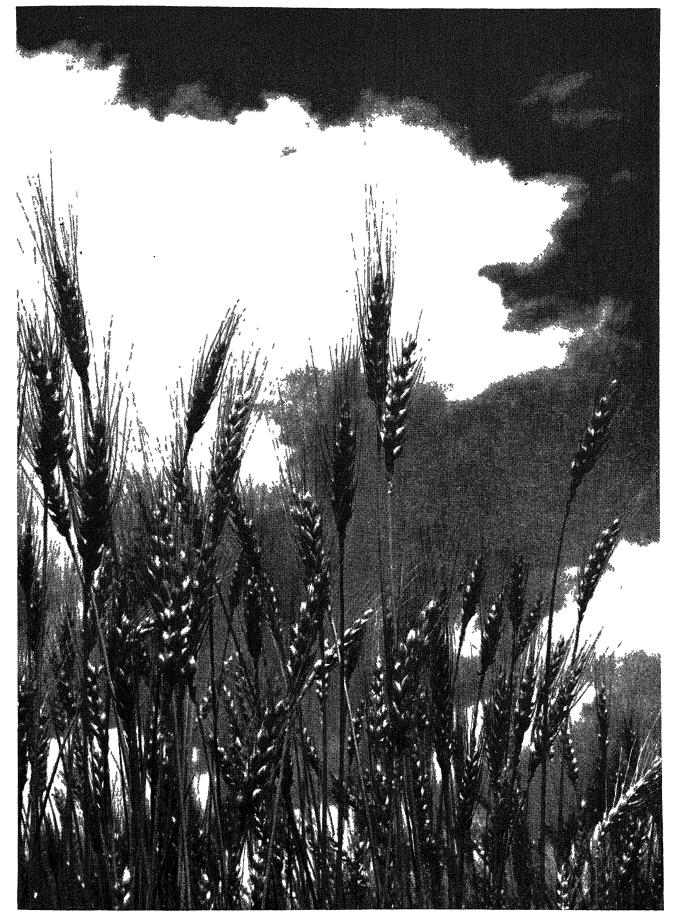

State officers in 1937 (elected in 1936) were Philip Fox La Follette, governor; Henry A. Gunderson, lieutenant governor; Theodore Dammann, secretary of state; Solomon Levitan, treasurer; and Orland S. Loomis, attorney general. The election of 1936 had represented a triumph for the newly organized Progressive party, which also gained a controlling voice in the legislature. But Roosevelt, Democratic candidate for president, received 802,984 votes to Landon's 380,826, and 74,748 for all others.

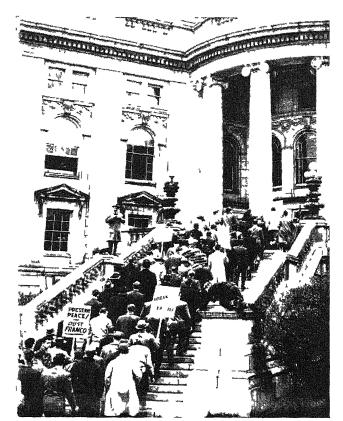

The general election of Nov. 8, 1938, however, brought serious reverses to the state administration. Three parties had nominees for the state offices: the Progressive, Republican and Democratic. The actual race proved to be between the Progressive and Republican parties, the latter winning an overwhelming victory. Julius P. Heil, Republican candidate for governor, emerged with a plurality of approximately 187,000 over La Follette, incumbent candidate for a fourth term. Republican candidates for the offices of secretary of state, attorney general and state treasurer received heavy pluralities also, and the Republicans elected 8 out of 10 congressmen, defeating all Progressive candidates save one. The state senate and assembly both secured Republican majorities. The Democratic party ran a poor third; even its candidate for the U.S. senate, F. Ryan Duffy, who was endorsed by Pres. Roosevelt, had a smaller vote than the Progressive candidate, Herman L. Ekern, and the combined votes of these two proved decidedly less than the votes polled by Alexander Wiley (Rep.).

In the presidential election of 1940, Roosevelt received 704,821 votes, Wendell Willkie (Rep.) 679,206, Norman Thomas (Soc.) 15,071, Earl Browder (Comm.) 2,394, Roger Babson (Proh.) 2,148, John W. Aiken (Soc. Lab.) 1,882. The 11 electoral votes of Wisconsin were given to Roosevelt by a smaller majority than in 1936 and 1932. Robert M. La Follette, Jr. (Prog.) was returned to the U.S. senate by a plurality vote, his Republican opponent, Fred M. Clauson, trailing by some 45,000 and the Democratic contender being left far behind. In the three-cornered race for the governorship the Republican incumbent, Julius P. Heil, had the plurality, Orland S. Loomis, the Progressive candidate, running second and Francis E. McGovern, Democrat, third. Again, as in the session of 1939, the Republicans gained control of both houses of the legislature, but by more impressive majorities. (J. Sc.; X.)

The legislature in 1941 passed a number of important measures. The Model Sabotage Prevention act prohibited and penalized intentional interference with the defense program. The State Guard act created a militia in the absence of the national guard. Communists were barred from the ballot. Military training was made compulsory

Blackhawk winter wheat, a disease-resistant hybrid developed by Dr. R. G. Shands at the University of Wisconsin college of agriculture to increase Wisconsin farm feed supplies. Seed raised in 1945 by certified growers was being cultivated in sufficient quantity for general farm distribution

Wisconsin veterans of World War II arriving at the capitol building in Madison to discuss grievances which included the question of bonuses and the rate of unemployment compensation

at the state university. Various civil service laws were passed to protect the rights of those in the military services. Safety and traffic regulations included a law under which all drivers had to renew their licences every four years. An amendment to the constitution permitting instalment payment of real estate taxes was submitted to the electors and ratified. The Unfair Sales act was clarified and strengthened. The teachers' tenure law of 1937 was repealed. Upon the death of Stephen Bolles, congressional representative from the 1st district, a special election was held in 1941. Lawrence H. Smith (Rep.) was opposed by a Progressive, Thomas R. Amlie, who ran on the Democratic ticket. Amlie, who stressed support of Roosevelt's foreign policy, was defeated by a 2-to-1 vote. (L. Kn.; X.)

The election of Nov. 3, 1942, was marked by bitter discussion of the prewar nonintervention attitude of Wisconsin members of the lower house of congress, but all were re-elected except three. The state elections showed a Republican gain in the legislature, so that Republicans held 74 of the 100 assembly seats and 23 of 33 senate seats. The state officers were all re-elected save Governor Heil (Rep.), who lost to Orland P. Loomis (Prog.), by a plurality of 100,000. Heil was criticized politically for allowing the conservation commission to remove Commissioner H. W. Mackenzie, for his frequent absence from the capital at Madison, for his expenditures in the contingent fund and for his administration of civilian defense. The death of Governor-elect Loomis on Dec. 7 raised a constitutional

question as to his successor, and the supreme court decided that under the constitution Lieutenant Governor W. S Goodland should serve as acting governor for the full two-yr, term.

The legislature, urged by the acting governor to put the state on a war footing and to set aside the money pouring in from the income tax for postwar construction and rehabilitation of war veterans, passed 566 acts in 1943 Of the governor's 36 vetoes, 21 were overridden by the legislature, one more than the total overridden in the entire history of the state, and the legislature insisted upon reconvening on Jan. 12, 1944. Yet much of the governor's program was obtained. The 60% emergency surtax on incomes was not re-enacted, but its yield for 1942 was set up as a postwar rehabilitation trust fund for returning veterans. A state trunk highway fund, estimated to contain \$17,450,000 by the end of the 1943-45 biennium, was created for postwar construction. The state Civil War debt of \$1,183,700 was retired. Unemployment insurance contribution rates and payments were increased, as were workmen's compensation payments. Aid to high schools was raised from \$1,385,000 to \$3,500,000 yearly. Civil service employees were voted a cost-of-living bonus, a pensionretirement plan, and a regulated system of annual increases. A controversial bill requiring all attorneys to be members of the state bar was passed over a veto and upheld by the supreme court.

The legislature convened for six days in Jan. 1944, enacting laws providing absentee ballots for soldiers in the 1944 elections and establishing a \$7,000,000 trust fund for building and modernizing state mental institutions. In March, Wendell L. Willkie focused national interest on Wisconsin by conducting a 1,500-mi., 13-day campaign to secure the state's 24 delegates to the national Republican convention on a frankly anti-isolationist platform. In April voters repudiated Willkie, electing 17 delegates pledged or friendly to Thomas E. Dewey, 4 pledged to Harold E. Stassen and 3 pledged to Douglas MacArthur. On the next day Willkie withdrew from the presidential race. In the August primary the vote was about 70% Republican, 23% Democratic, and less than 7% Progressive. In November Dewey received a 24,000-vote lead over Pres. Roosevelt and 50.91% of the popular vote. U.S. Senator Wiley (Rep.) was re-elected by 97,000 votes despite bitter attacks on his isolationist record by H. J. McMurray (Dem.).

The Republican state ticket swept to an easy victory in 1944, led by Acting Governor Goodland, 82 years old, who became governor in his own right with a plurality of 161,000 over D. W. Hoan, Democrat and former Social-

ist. Oscar Rennebohm was elected lieutenant governor, and the secretary of state, treasurer and attorney general were retained. The new assembly

"Prodigal's Return," a Shoemaker cartoon which appeared in the Chicago Daily News in March 1946 following the return of the Wisconsin Progressives to the Republican party, ending 12 years of independent existence

included 75 Republicans (gain of 3), 19 Democrats (gain of 4) and 6 Progressives (loss of 7). The senate consisted of 22 Republicans (loss of 1), 6 Democrats (gain of 2) and 5 Progressives (loss of 1). The election showed clearly the decline of the Progressive party, which polled less than 6% of the vote for governor. The state as a whole appeared anti-Roosevelt and anti-New Deal rather than non-interventionist. The Progressives in most cases had stronger non-interventionist records than did the Republicans.

The legislature met on Jan. 10, 1945, recessed on June

20 until Sept. 5, and adjourned on Sept. 6, having passed 590 acts. Though overwhelmingly Republican, it engaged in considerable controversy with the Republican governor. He presented the largest budget in state history and it was adopted in substantially the same form. He advocated a building program for state education and welfare institutions calling for \$23,193,050 to be financed from the balance on hand and the high yield of existing taxes. But the advocates of highway construction passed a bill over his veto segregating motor vehicle tax yields in a separate fund for highway purposes. The legislature then trimmed the building program to \$16,473,500, which included \$8,000,000 for the university, \$4,600,000 for the department of public welfare and \$3,150,000 for the teachers colleges.

The legislature also approved a rather strict antigambling bill, strengthened laws against lobbying, but failed to pass over the governor's veto a bill to prevent candidates changing parties readily. The state elections in April 1945 witnessed an exciting race for justice of the supreme court between Elmer Barlow, the incumbent, and F. R. Zimmerman, secretary of state, who was not an attorney. Barlow won by more than 70,000 votes. John Callahan, 79, superintendent of public instruction from 1921, defeated Arthur Jorgensen by about 60,000. (E. P. A.; X.)

The Progressive party, established in 1934 under the leadership of the La Follette brothers, dissolved itself at a convention at Portage, March 17, 1946, and voted to rejoin the Republican party. In the ensuing primary on Aug.

13, the ex-Progressive forces were turned back in an effort to capture the key nominations. Governor Goodland, denied renomination by the Republican convention, defeated the former Progressive, Ralph Immell, in a three-way race in which the organization candidate ran a poor third, while Judge Joseph V. McCarthy upset Senator La Follette in a very close contest for the senatorial nomination. The state's representation in congress consisted at the end of 1946 of 2 Republican senators and 10 Republican representatives.

Women, Freedom of

The women of the world made great advances during the decade 1937-46, particularly during and after World War II. Wars sometimes have this curious effect, partly because the mould of habit breaks up in wartime and it becomes comparatively easy to form new moulds; and partly because women's enormous contribution to victory in this particular war earned them recognition in quarters where it had heretofore been lacking. Much the same phenomenon occurred in the U.S. following the Civil War, when educational institutions for women had a sudden flowering and when the foundations were laid for the development of the profession of nursing and the Red Cross, one of the first great humanitarian efforts ever organized by women. World War I in its turn hastened the entry of women into many new fields of work, in which many of them remained and made good. It also precipitated the granting of suffrage to the women of Great Britain and the U.S. World War II merely accelerated these same trends.

Hitler's Ideas about Women.-But our story begins before the war. In 1936, the U.S. was still in the depths of the greatest depression in history and the menace of Hitlerism was increasingly blackening the world sky. The trend of work for women outside the home had been on the increase ever since the industrial revolution in the middle of the 19th century. The tens and twenties of the 20th century had seen advances by women in every field. But in depressions women are the first to be fired, and this depression was no exception to the rule. No matter how much they needed their jobs, no matter how many dependents they had to support, women were fired in great numbers, in order, so the theory went, to give more jobs to men. The fact that most women worked because they had to, because they had to support themselves and their dependents, was all too frequently overlooked.

The situation was aggravated during the '30s by the rise of fascism with its philosophy of the degradation of women. In Hitler's Germany, women were legally classified not as citizens but as subjects. A woman's world, said Hitler, "is her husband, her family, her children and her home. . . . We do not find it right when the woman presses into the world of the man. Rather we find it natural when these two worlds remain separate. . . . Reason is dominant in man." All that mattered to a woman, in Hitler's opinion, was "the child that must come into being and that must thrive." And Mussolini, not to be outdone, added his echo: "Women must play a passive part. . . . Of course I do not want women to be slaves but . . ." and so on.

Dictatorship, however, had never bothered about consistency. At first a passionate advocate of woman's place in the home, Hitler gradually lost interest in keeping women in it as his need for guns increased. It suited his purposes better to put them to work in factories, mostly as heavy, unskilled, cheap labour. As a Berlin newspaper of the period said, "Women are generally cheap, and manu-

facturers appreciate cheap labour." Whether in the kitchen or in the factory mattered very little; women under Hitler were definitely second-rate citizens. But the era of Hitler passed, and with its passing came great victories for women.

Political Advances.-Women's most striking victories of the decade occurred in the political field. Before World War II, in addition to the U.S. and Great Britain, votes for women had come only to Australia, Austria, Brazil. Canada (with the exception of Quebec), China, Cuba, Czechoslovakia, Denmark, Estonia, Finland, Germany (where it was meaningless under Hitler), Iceland, Latvia, Lithuania, Luxembourg, the Netherlands, New Zealand, Norway (the first European country to enfranchise women), Poland, Russia, Spain, Sweden and Turkey. Other countries granted them a limited franchise, restricted either to local elections or to limited age groups or to those with special educational or property qualifications. Among these countries were included South Africa, Chile, Greece, Hungary and Portugal. India granted a limited franchise of this sort to both men and women. But in many countries women had no right of franchise whatever. This was true of Afghanistan, Albania, Argentina, Belgium, Bolivia, Colombia, Costa Rica, the Dominican Republic, Egypt, El Salvador, France, Guatemala, Haiti, Honduras, Iran, Iraq, Lebanon, Mexico, Saudi Arabia, Syria, and Switzerland. In other countries, such as Italy, where women theoretically had the vote, they seldom used it. And while the constitution of the Spanish republic of 1931 gave women the vote, the practice after 1939 under Franco was not to encourage it. Thus the battle for suffrage was barely half won.

But World War II changed this picture with startling rapidity. What happened in France was perhaps typical of the revolution that took place all over the world. During the German occupation of 1940–45, women had played a prominent role in France. Swept almost bare of its men of fighting age, the country found itself a country of women and children—and older men. Women were therefore the heart of the resistance. When the tide turned and victory was on its way, De Gaulle decreed that women should vote in the first elections to be held in free France. And vote they did—in overwhelming numbers—electing many of their sex to the assembly. The new constitution of France, drafted by the delegates for whom the women voted, provided for universal suffrage.

Voting for the first time in French history, women outnumbered men at the polls during the municipal election of April 29, 1945, the first French election after liberation

Japanese women were enfranchised for the first time on Dec. 11, 1945. Women who gained seats in the diet during the elections of April 1946 are shown during a conference devoted to the problems of their countrywomen

Other countries also rushed to give women the vote or to expand their previous limited voting powers. Argentina gave them the vote in 1946, Belgium was in process of so doing; in Canada the province of Quebec joined the procession; the Dominican Republic granted the vote in 1942, El Salvador in 1939, Guatemala in 1945 and most surprising of all, following its occupation by the U.S. in 1945, Japan followed suit. At the end of 1946 Mexico was also about to give women the right to vote in local elections. It was estimated that of the members of the United Nations at the end of 1946, 37 countries had granted women the vote in one form or another by the end of 1946 and 16 had not. Of those not members of the United Nations, four (Finland, Eire, Italy and Japan) had given women the vote, four (including Switzerland) had not and the rest had granted a limited voting power.

In most countries, eligibility to hold public office had run parallel with the right to vote. This had always been true in all the states of the U.S. with the single exception of Oklahoma. That state had long had a law on its statute books forbidding women to hold certain public offices, including those of governor, lieutenant-governor, secretary of state, attorney-general, state treasurer, and one or two others. This anachronism was removed from the statute books and, except for minor positions in a few states, women were eligible at the end of the decade for practically all elective and most appointive public offices.

A curious situation existed in Belgium, where women were eligible for public office and were elected and appointed to them, but could not themselves vote for such offices. This anomaly was in process of change, however.

In Great Britain, one of the long prohibited fields for women had been the diplomatic service. This taboo was successfully broken down during World War II, and women became eligible for diplomatic and consular appointments overseas. Their appointments by the end of the decade had been to posts of modest rank, and no woman minister or ambassador had as yet appeared on the scene. In the U.S., where no legal bar existed, there had been two women ministers to foreign countries, one to Denmark and the other to Norway, where she was caught by

the German invasion in 1940 and forced to flee with the king of Norway and his court to England. Both of these appointments were made before the war.

In Canada, where women had previously been barred from the senate on the ground that an old statute governing eligibility used the word "person" in the sense of a male person only, a woman nominated to the senate contested this interpretation of the statute to the highest court in the land and won her case. Women were now persons in Canada, for this purpose at least, and a woman accordingly sat in the dominion senate.

Military Service.—Perhaps the most interesting aspect of the war years (and proof, if proof were needed, of the war's quality of totality) was the service of women not only with but actually within the armed forces. This was more striking in those countries which were in the actual war theatres than it seemed in the more remote U.S. But the phenomenon was universal. In the U.S.S.R., for instance, women fought in the armies side by side with men; women doctors performed feats of heroism in the front lines under fire, and women everywhere were organized for defense of the fatherland. This was also true to a varying extent in every invaded country. In France, the women of the resistance worked side by side with the men. In England, invaded by bombs if not by armies, the women in the various branches of the armed forces, while in theory noncombatants, actually frequented the danger zones quite as much as the men. It would have been impossible to keep them in a safe place. When raids were on, they manned and often fired the anti-aircraft guns. Had there been an invasion, they would have fought as surely and to as deadly effect as their Russian sisters. The WRENs in the navy, the A.T.S. in the army, the WAFs in the air service and the special corps of women ferrying bomber planes, the Women's Land army, the fire and air raid wardens, all contributed to the heroic defense.

The same thing happened in only lesser degree in the U.S. In World War I there had been a few female yeomen (mostly clerical workers) in the navy. In World War II, women's services were recognized from the start as indispensable and were eagerly sought after. First to be formed were the WAACs, an auxiliary service outside the army. Then came the WAVES, a woman's division within the navy, although, somewhat like Gilbert and Sullivan's

admiral, not allowed to serve at sea. This was followed by the SPARS, a subdivision of the coast guard, and finally by the full-fledged women members of the marines. These woman marines spurred the WAACs to abandon their auxiliary status, and they secured legislation making them full-fledged members of the U.S. army, known as the WACs, their chief officer a colonel and themselves regular officers and enlisted personnel of the armed forces. There was also a small auxiliary force of women flyers who instructed army flyers, ferried bomber planes and otherwise did everything short of fighting in this most hazardous of wartime jobs.

Women doctors had perhaps a harder struggle for recognition than did any other group of American women. Although many volunteered for service with the armed forces, they were at first refused commissions on the ground that the statute covering the situation used the word "person" in a purely masculine sense. It was necessary to pass special legislation in order to qualify them for commissions in the medical corps of the army and navy. While the legislation was passed too late in the war to secure the services of many women doctors, those who served did so with distinction.

But it was not only the women in actual military service who acquitted themselves with credit. The civilian and voluntary services of women reached an all-time peak. The Red Cross, the British and American Women's Voluntary services, in the U.S. the C.D.V.O. (Civilian Defense Volunteer's organization), the women's land armies, the air raid wardens' organizations and many others supplemented the war effort and were indispensable to it. The air raid wardens' service in England, in particular, which fought fires night after night and dug in the ruins by day for victims of the bombings, was a service of women quite as much as men. (See also British Women's Services, World War II; CANADIAN WOMEN'S SERVICES, WORLD WAR II; COAST GUARD, U.S.; MARINE CORPS, U.S.; WOMEN'S AIRFORCE SERV-ICE PILOTS; WOMEN'S ARMY CORPS; WOMEN'S RESERVE OF THE U.S. NAVY.)

Other Civil Rights.—The decade also saw an advance in the field of nationality. The Cable act of 1922 had given women in the U.S. the right to choose their own nationality independent of their husbands. Another act was passed in 1934 which gave to children born out of the U.S., whose nationality had previously followed that of their father or of the country in which they had been born, the power to choose their father's or their mother's nationality. An advance was also made along similar lines in Great Britain, where women, whose nationality had always followed that of their husbands, were first given power during World War II to recover their nationality if married to an enemy alien and, second, were later given full power to retain their nationality under any and all circumstances.

The service of women on juries was considerably expanded in the U.S. during the decade 1937–46 by the addition of six states to the group of those admitting women to such service. While four of these six did not require such service to be compulsory and made it purely optional, nevertheless their inclusion in the ranks of women jury states left only 17 states which limited jury service to men.

A variety of other small changes in the laws of the different states were all in the direction of removing obsolete and outmoded discriminations against married women. Georgia passed a law safeguarding a married woman's right as an individual to her personal earnings; New Jersey passed a law forbidding discrimination against married women in the holding of public office, and North Carolina and West Virginia passed similar laws relating to married women teachers. The trend of judicial decisions was in the same direction—that of recognizing women's rights and responsibilities as independent human beings. Thus an increasing number of judges were tending to award alimony to the husband in cases where the wife had means and the husband was ill or for some other good reason was without earning power.

The fight for a blanket equal rights amendment to the U.S. constitution continued, with the forces opposed to special labour laws for women lined up in favour of the amendment and those favouring retention of the power to enact such laws lined up on the other side. The amendment for the first time in its history came up for vote on the senate floor in the summer of 1946 and failed to receive the required two-thirds majority.

Economic Advances.—Equally striking, although more difficult to assess and perhaps in part impermanent, were the gains made by women on the economic front.

The trend of women's work outside the home continued steadily on the increase. In 1870 women formed 14.8% of the entire working population of the U.S. By 1930 their numbers had grown to 22%. The depression which was then commencing constituted a serious setback. But by 1940 the percentage had gone up again and beyond, to 24.3%; by 1945, at the peak of the war effort, it was 34.7%. More than 6,000,000 women (one-half the former total) had been added to the labour force. A higher percent probably prevailed in Great Britain, where the manpower shortage was even more acute and the conversion of the country to munitions making even more complete.

The occupations of women also underwent a change. In 1940 the entire labour force of women amounted to about 12,750,000 as compared to a masculine labour force of about 40,000,000. Of these women, over one-half worked in domestic service and at clerical or selling jobs of one sort or another. The rest of them furnished almost all nurses, the bulk of social workers, a majority of teachers, a large proportion of factory workers in the needle trades and practically all telephone operators. Comparatively few of them were employed as labourers, craftsmen or farmers. In the fields of transportation and heavy industry and in the higher executive posts, women were practically unknown. But World War II changed the picture with surprising speed. War needs took women out of domestic service and into munitions factories. Great numbers of women worked in aircraft and gun and electrical equipment factories. They riveted ships in shipyards, helped run the railroads and harvest the crops. They were increasingly called upon for engineering and scientific skills of all sorts. As the manpower shortage increased, they moved into one new occupation after another until eventually there were very few which they had not touched.

This invasion into new fields necessitated a number of changes, including the opening of the doors of trade unions to them. Some old-line unions, the boilermaker's among them, not only had never had women members, but actually had bylaws excluding women. These bylaws had to be changed or else honoured in the breach.

Another problem was that of pay. The notion that women were cheap unfortunately was not confined to Hitler. Ever since their first advent into industry women had to struggle for equal pay for equal work. The tradition of paying them less than men, even for identical work, was hoary and well entrenched. It was even written into some union contracts. During the war, the principle was laid down by the U.S. government that there should be

equal pay for equal work, and the National War Labor board acted upon this theory when it ruled that wage increases granted to women workers for the purpose of bringing them up to the general level prevailing in particular plants were not to be considered wage increases as such but merely the removal of unjust inequalities. This principle of equal pay for equal work mounted in public favour, and four states enacted equal pay laws. A bill was introduced into the federal congress in 1946 to accomplish the same result nationally.

The close of World War II brought an abrupt loss of jobs to a substantial number of women. It was estimated that from the high of nearly 19,000,000 in the U.S., 4,000,000 women were displaced. The demand for labour in other fields was so great, however, that many of these women did not remain unemployed long. By the end of 1946, about 2,000,000 had been re-employed in civilian occupations, and the woman labour force was only slightly under 17,000,000, or about 30% of the total U.S. labour force. Of the remaining 2,000,000, only about 250,000 were listed as unemployed and seeking work, which suggested that the others were never a part of the permanent labour force but took jobs in wartime as a patriotic duty.

The United Nations.—The United Nations charter, as first drafted, contained no reference to human rights. But when it came up for final approval at San Francisco in 1945, the statesmen were faced with a great ground swell of popular demand for the addition of what in effect amounted to a bill of rights. The preamble therefore listed among its objectives the achievement of international cooperation "in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion."

This principle was repeated several times in the body of the charter. In its implementation, a Commission on Human Rights was set up as a permanent part of the machinery of the United Nations. In further implementation of that portion of it relating to sex, the following clause, taken in modified form from the covenant of the old League of Nations, was also incorporated in the charter: "Article 8:

The United Nations shall place no restrictions on the eligibility of men and women to participate in any capacity and under conditions of equality in its principal and subsidiary organs."

At the first meeting of the general assembly in London early in 1946, the Human Rights commission was set up. The assembly also set up, under it, a subcommission on the status of women, which was later changed to a full commission on a par with all the other commissions of the United Nations. But the assembly did not stop there. At its second meeting held in New York late in 1946, it adopted the following resolution: "That all Member States which have not already done so, adopt measures necessary to fulfill the purposes and aims of the Charter in this respect by granting to women the same political rights as to men."

Women's Airforce Service Pilots

For more than two years women pilots served with the U.S. army air forces (AAF) and, by their contribution to the war effort, proved that women could be trained in large numbers and utilized for most noncombat military pilot operations. In training, safety and in operations, their performance was comparable to the over-all record of the AAF flying within the continental limits of the United States. At the time of deactivation, 938 WASP were on duty, 637 in operations for the training command, 164 with the air transport command, 118 in domestic air forces, 3 in proving ground command, 3 in air technical service command, 11 in weather wing and 2 in head-quarters AAF.

The women's pilot program was first considered by the army air forces in connection with possible demands of global warfare in the summer of 1941, but because there was at the time a lack of aircraft and an ample supply of male pilots, the program was not activated until the fall of 1942, when two experimental groups, one in operations and one in training, were formed. In the interim between conception and activation of the program, 25 qualified U.S. women pilots entered the service of Great Britain's ferrying operations and demonstrated that a select group of qualified women pilots could serve a military purpose.

The experimental operational group of the AAF women pilot program was organized by the ferrying command at New Castle, Del. It was made up of about 30 qualified commercial licensed pilots. The group was known as WAFS, Women's Auxiliary Ferrying squadron, and was under the leadership of Nancy Harkness Love. After four to six weeks' orientation training they were assigned to ferrying light liaison and training planes within the continental limits of the United States. All subsequent operational groups were processed through the women pilot training program.

The first training group enlisted pilots of less experience and was directed by Jacqueline Cochran (Mrs. Floyd B. Odlum). When both experimental groups had proved the feasibility of employing women for noncombat military operations, the program was enlarged, and unified; the official name WASP was adopted, and the whole was placed under the direction of Miss Cochran.

More than 2,500 young women between 18 and 35 years of age applied for WASP training; 1,830 were accepted. During training about 30% were eliminated for flying deficiency and about 2% for other reasons—a lower rate than among male cadets. Of the women accepted, 80 resigned and 1,074 were graduated. Of the graduates, over 83% were with the program at time of deactivation in addition to 16 pilots from the original ferrying group. During training, 11 WASP trainees lost their lives; during operations 27 WASP were killed.

After graduation from training, the WASP flew 60,000,000 mi. in such operations as ferrying, target-towing, tracking and searchlight missions, simulated strafing, smoke laying and other chemical missions, radio control flying, basic and instrument instruction, engineering test flying, administrative and utility flying. They flew all types of military aircraft from light training and liaison planes to the rocket propelled and the superfort B-29, including B-17, B-26, C-54, the Mustang and Thunderbolt.

The program was deactivated Dec. 1944 at a time when the WASP were prepared to give maximum service, because a fortunate change in the demands of war had made sur-

plus many more trained AAF male pilots than had been anticipated. The WASP had proved the worth of their service, but were no longer needed. A congressional bill to militarize the WASP was defeated. (H. TA.)

Women's Army Corps

The Women's Army corps (WAC), originally created as the Women's Army Auxiliary corps by public law 554, 77th congress, approved on May 14, 1942, became a part of the army of the United States when public law 110, 78th congress, was signed by President Roosevelt on July 1, 1943.

The purpose of the corps was to make available to U.S. national defense, for the duration of World War II and six months thereafter, the knowledge, skill and special training of U.S. women.

Mrs. Oveta Culp Hobby, former Texas newspaper woman, legislator, civic leader and organizer, who, at the time of the writing of the bill, was directing the activities of the women's interest section in the bureau of public relations of the war department, was named director of the Women's Army Auxiliary corps on May 14, 1942. She took the oath of office with rank equivalent to that of colonel in the army of the United States, the first U.S. woman to hold such rank.

After three full years of service, Colonel Hobby resigned from active duty on July 12, 1945. She was succeeded by the deputy director of the WAC, Lt. Col. Westray Battle Boyce, who was simultaneously elevated to the rank of colonel.

To be eligible for enlistment, applicants had to be between the ages of 20 and 50, U.S. citizens, with at least 2 years of high school; no women with children under 14 years of age were accepted, unless the full care and custody of the children had been in other hands for 18 months prior to making application for enlistment.

In addition, because women were assigned to jobs requiring specific skills, they were also required to meet certain high standards of intelligence, stability and personal integrity. These standards were determined by means of written test and interview, to bring into the army only women who could readily adjust themselves and do the job happily and well.

At its top strength, the Women's Army corps numbered 100,000, of whom approximately 18,000 served overseas in 21 different countries. The Wacs in the United States served at more than 400 army installations, and were engaged in 239 noncombatant army jobs.

WACS were trained first at Fort Des Moines, Ia. Then, as the corps expanded, other training centres were opened at Fort Oglethorpe, Ga.; Daytona Beach, Fla.; Fort Devens, Mass., and Camp Polk, La. Enlistments in the WAC were closed on Aug. 29, 1945, following the cessation of hostilities.

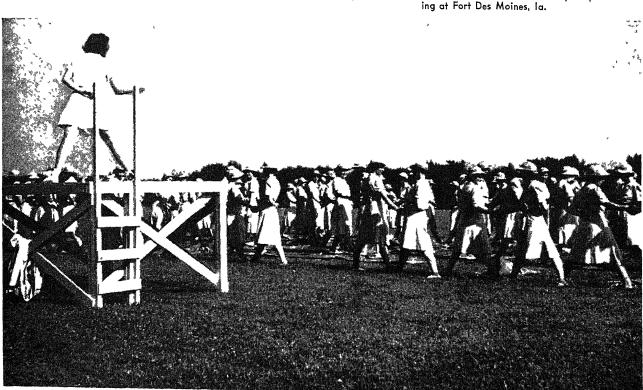

Basic training for women in the army was six weeks, during which the transition from civilian to military life was made.

The basic military program was, with some adaption, the same as the first six weeks of military training given to men in the army. The courses were largely the same, the drill the same (except for shorter steps and without weapons) and the daily routine likewise the same.

In the course of training the women were taught military customs and courtesies, organization of the army, defense against chemical and air attack, first aid, barracks sanitation and wear and care of the uniform. They learned to dress in 15 minutes, to march in formation and to master simple physical conditioning exercises designed especially for women to keep them fit for army duties.

Following basic military training, the woman soldier was assigned directly to a post, camp or station somewhere within the United States, or given additional training in

Group exercises for members of the Women's Army corps in train-

Parade of overseas WACs on the Champs Élysées in Paris, celebrating the third anniversary of the Women's Army corps, May 1945

one of the basic technical courses conducted at the training centre, or sent to a specialist school.

If her civilian skills were such that she needed no more than on-the-job training at an army post, she was assigned directly to an army job. The majority of women fell into this category. If she qualified in one of the fields for which additional training was required, she was sent to a specialist school. As women acquired proficiency on an army job, they became eligible for advanced military specialists' training at any of the army schools open to enlisted men. Officers were eligible to attend the Command and General Staff school or any officers' school, except the wholly tactical schools available to men of the army.

The type and extent of advanced military training given members of the Women's Army corps depended on the need for such advanced skills in the command to which the individual was assigned. She was sent to a small arms repair school, for example, if the post to which she was assigned saw that there was or would be need for personnel with such training. The extent of training was gauged always by army needs.

Whether a member of the Women's Army corps acquired new skills by attending a school or by learning on the job, each new military specialty she acquired was entered on her classification card. It was by these military specialist numbers that she might later be selected for reassignment to a more important job in the United States or overseas. Overseas theatre commanders placed requisitions for WAC personnel by these military occupation specialties (MOS).

There were 239 of these specialties in which women in the army were found equally adept, sometimes more so, than men. Many of them had civilian counterparts (stenography and typing, for example) which had long been a field for women rather than men. Many others were army jobs which had no civilian counterpart, but for which women were readily trained.

The first class of officer candidates began on July 20, 1942, at Fort Des Moines, Ia. This class and eight succeeding classes were made up of eligible women selected directly from civilian life. The tenth, which started early in Nov. 1942 and all subsequent classes were composed of women selected from the ranks of the corps. Beginning in Sept. 1943 all officer candidate classes were held at the 3rd WAC Training centre, Fort Oglethorpe, Ga. They continued there until they were shifted back to Fort Des Moines, where the 57th class began on March 5, 1945. The last and final class of officer candidates, the 60th, was commissioned on Nov. 17, 1945.

At peak strength of approximately 100,000 (6,800 officers and 93,000 enlisted women), members of the Women's Army corps were serving at more than 400 installations in the United States and in all theatres of operation. They performed practically every type of task except actual combat. Enlisted women were assigned, for headquarters work, to combat elements in overseas theatres. The women of the corps served with army ground force installations, with the army air forces, corps of engineers, the ordnance department, chemical warfare service, the signal corps, military intelligence, the provost marshal general's office, the transportation and quartermaster corps, the judge advocate general's and the inspector general's departments, the surgeon general's office, office chief of finance, in the adjutant general's office, in civil affairs and with the general staff corps.

WACS were present at many of the historic moments of

World War II. Twenty-seven of them operated the switchboard at the Potsdam conference; 432 worked on the atomic bomb project; others were present at the meetings of the Big Three at Yalta, in Canada, at Potsdam, at the German surrender at Reims and at the Japanese surrender at Baguio, P.I. Still others were on duty as legal stenographers and aides at the war crimes trials in Germany and in Manila.

One of the unusual jobs held by WACS was in the prisoner of war camp at Chartres (France), where they handled administration in connection with 500 German women prisoners. In the 8th air force, WACS worked as watch officers, staying with a mission from the planning stage to the return of the bombers. A former University of Illinois coed directed a fleet of taxis in Paris. In the United States, women served as radio operators in transport planes, on bombers at training fields and on hospital ships.

Before any WAC was sent overseas, she must have spent at least three months on an army job in this country, to enable her to acquire a general knowledge of army procedure, improve her occupational skill and so adapt herself to army work methods that she was equipped to adjust herself to new surroundings.

It never proved necessary to send any woman to a foreign theatre who, for personal or family reasons, might undergo great hardship in leaving the United States. So many women were eager for overseas service that for the most part selection was made from those who had volunteered.

Not all of the willing and capable volunteers were sent overseas. However, nearly 18% of the army's 100,000 WACS did go, and some had more than 3 years of overseas service. WAC officers and enlisted women served in Bermuda, Puerto Rico, Italy, North Africa, Alaska, the Netherlands Indies, Belgium, Scotland, Germany, England, France, Egypt, India, China, Ceylon, New Guinea, Australia, Hawaii, Labrador, British Columbia and Yukon territory, Leyte and Luzon in the Philippines, Japan and Korea, New Caledonia, African Gold coast, New Zealand, Austria and Panama.

More than 9,000, the largest number in any 1 overseas theatre, were serving in the European theatre of operations just after V-E day. At the same time there were approximately 5,600 in the Pacific theatre.

Pay for members of the Women's Army corps was exactly the same as that of men in the army for the corresponding grade or rank. Where their duties warranted it, WACS drew flying pay and all of those serving overseas received the same additional overseas pay as the men.

Although originally the head of Pallas Athene, official WAC insignia, was worn by all members of the corps, after Sept. 1943 it was replaced by many for the insignia of other branches of the army to which they had been assigned. For example, women serving with the army air forces, wore the air force wings; those with the signal corps, the crossed semaphores; women with ordnance, the bursting bomb and those with the general staff corps, the insignia of the general staff.

Women in the army were subject to all army regulations, had the privileges of free medical care, free postage, leave and furlough. They were entitled to benefits under the Soldier's and Sailor's Relief act as well as all benefits provided under the GI Bill of Rights. They were eligible also for National Service Life insurance.

Service in the predecessor Women's Army Auxiliary corps did not entitle former members to veterans' rights and

benefits. However, they were entitled to mustering out pay and hospitalization, if they were honourably discharged for physical disability.

As of March 1, 1946, one member of the corps had been awarded the Distinguished Service Medal; 33 the Legion of Merit; 479 the Bronze Star; 7 the Soldier's Medal; 2 the Air Medal; 2 the French Legion of Honour; 5 the French Croix de Guerre; 16 the Purple Heart; 2 had received letters of commendation from the United States navy; 7 wore the Most Excellent Order of the British Empire and 31 Meritorious Service Unit Plaques had been awarded.

On June 1, 1946, the strength of the Women's Army corps was approximately 20,000. While recruiting was discontinued after V-J day, on April 1, 1946 the war department announced a re-entry program, permitting honourably discharged WACS to re-enter the corps at the grade held upon discharge.

On July 24, 1946, the WAC Integration Act of 1946, establishing the Women's Army corps in the regular army, was introduced in the senate by Chairman Elbert Thomas of the senate military affairs committee. The same bill was introduced in the house of representatives on July 26, 1946. The bill called for an initial corps strength of 5,000 enlisted women and 500 officers, and established the maximum strength at 2% of the regular army male strength authorized from time to time. (W. B. BE.)

Women's Reserve of the U.S. Navy

The women's reserve of the United States naval reserve (WAVES) was established as an amendment to the Naval Reserve act of 1938 on July 30, 1942. Although enlisted women served with the navy in World War I this was the first time they were enlisted and appointed as officers on an equal basis with men. The legislation originally limited ranks to 1 lieutenant commander, not more than 35 lieutenants, and lieutenants (junior grade) not in excess of 35% of the total number of commissioned officers. However, this limitation proved too restrictive as numbers increased, and on Nov. 8, 1943, the original legislation was amended removing restrictions on ranks up to captain and limiting that rank to one officer. This amendment likewise provided more liberal allowances and benefits comparable to those for male officers and enlisted men rather than to those for civil service employees. The restriction of assignments to continental United States which was in the original legislation was not removed until Sept. 1944, when another amendment authorized assigning women outside the continental limits of the United States to the American area and the territories of Hawaii and Alaska.

Three WAVES, trained as machinist's mates in the repair and overhauling of aeroplane engines, working on a navy plane at the naval air station in Jacksonville, Fla., during 1944

Under the authority of this act, women could serve in the navy "during the present war and for six months thereafter or until such earlier time as the Congress by concurrent resolution or the President by proclamation may designate." It was planned to continue on active duty a limited number of officers and enlisted women volunteering until July 1, 1947.

The first woman to be sworn into the navy on Aug. 3, 1942, was the director, the former Mildred H. McAfee (later Mrs. Douglas Horton), president of Wellesley college, Wellesley, Mass. She served in this capacity first as a lieutenant commander and later as a captain until Feb. 1946, when she resigned from the service to resume her full time duties at Wellesley college. Her place was taken by Jean T. Palmer, who had served as an assistant to Mrs. Horton since the beginning of the program.

The standards for the appointment of women officers were the same as for male officers in the naval reserve, while the educational qualifications of enlisted women were higher than those for enlisted men. Some of the physical requirements were slightly lowered for women since their service was to be confined to shore based naval activities.

Training.—The training of WAVES began less than a month after the passage of the necessary legislation, when an advance class of approximately 100 women reported to the Naval Reserve Midshipmen's school (WR) on the campus of Smith college, Northampton, Mass., prior to their assignment to recruiting and procurement offices and to the staffs of schools for WAVES which were to open soon. A two-month course for officer candidates was developed there which gave women a practical introduction to navy life and to their responsibilities as naval officers.

WAVES were also classified for their future duties through interviews with trained personnel officers. This officer school continued until Dec. 1944 and at one time also utilized facilities at Mount Holyoke college in South Hadley, Mass. It was later replaced on a much smaller

scale by an officer candidate school in Washington, D.C., from April to Oct. 1945. The classes at the school in Washington varied in number from 20 to 30 WAVES and were composed of former enlisted women and of occupational and physical therapists drawn from civilian sources. Altogether over 9,000 women officers were trained, 12% of whom came from enlisted status. Many women officers were assigned directly to their duty stations at the completion of their indoctrinal period but others needed further training in their specialized fields before assuming their new duties. A communications school operated at Northampton, Mass., under the same command as the midshipmen's school.

The first class of women entered the Radcliffe branch of the supply corps school at Harvard university, Cambridge, Mass. during Jan. 1943. In Sept. 1943 training of aerological engineers was established at Massachusetts Institute of Technology in Cambridge, and other aerology classes later entered the University of Chicago and the University of California at Los Angeles. Other programs included the preparation of officers for duties in technical and administrative radar, Japanese language, air combat information, educational services and as instructors in air navigation, link celestial navigation, ships and aircraft recognition, aviation radio, photographic interpretation and gunnery.

The first schools for enlisted women opened Oct. 9, 1942, and combined both recruit and specialized training. WAVES learned to be radiomen on the campus of the University of Wisconsin at Madison; they became yeomen at Oklahoma A. & M. College at Stillwater and they prepared for duties as storekeepers at the University of Indiana at Bloomington. The first recruit school for WAVES opened on the campus of Iowa State Teachers college in Cedar Falls, Ia., in Dec. 1942; this school later trained yeomen when recruit training was transferred to New York city, where larger facilities were available. Other yeoman and radioman schools were established later.

The Naval Training school (WR), the Bronx, N.Y., on the uptown campus of Hunter college, was commissioned on Feb. 9, 1943. There a recruit training program was organized which provided WAVES with instruction in naval customs, regulations and history. In addition, the WAVES were classified for their future assignments to specialized training or to duty in the field as the result of interviews and standard navy tests. The length of this recruit training was originally four weeks, but was lengthened first to six weeks and later to eight weeks. This school remained the largest of those for WAVES, and at the peak of procurement for the women's reserve as many as 5,000 WAVES were in training there at one time.

During later months other training units for enlisted WAVES were located on the station at the Bronx. Specialists (S) V-10 (personnel supervisors) mailmen, cooks and bakers received instruction at schools there, and hospital corps WAVES were prepared for general duties in medical activities, or received advanced training for rehabilitation work.

The first specialized training for the aviation ratings began in Feb. 1943. Future aviation machinist's mates and aviation metalsmiths learned to repair planes and engines at the school at the Naval Training station, Norman, Okla., and in Memphis, Tenn. The first of many classes of link trainer instructors began learning the fundamentals of teaching flight by instruments at the Naval Air station, Atlanta, Ga. Training for assignments in aviation con-

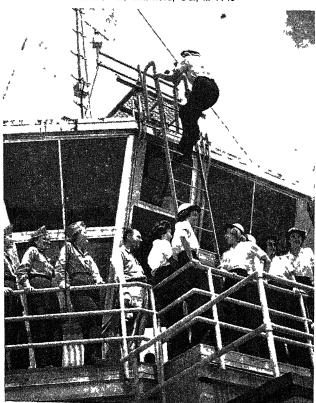

tinued to expand and later included preparation for duties as parachute riggers, aerographer's mates, control tower operators, fixed and free aircraft gunnery instructors, aircraft instrument repairmen, link celestial navigation operator-maintenance personnel, aerial camera repairmen and carrier pigeon trainers.

The training of women for the hospital corps was originally done at naval hospitals. This program, however, was gradually superseded by the concentration of initial hospital corps training at the school which opened in Bethesda, Md., Jan. 12, 1944. In the summer of 1945 when hundreds of new recruits were sent to this type of training, the activity at Bethesda was supplemented by schools at Camp Moffett, Great Lakes, Ill., and the Bronx, N.Y.

The graduation of the last class of WAVES from the Hospital Corps school at Bethesda, Md., Jan. 10, 1946, brought to a close the training program for members of the women's reserve, which at its peak in 1944 was carried on at approximately 40 naval activities. In the three-and-ahalf years this program was in effect, 86,000 WAVES received either recruit or midshipmen's training, and many were also assigned to specialized training for duties in aviation, supply, medical and administrative activities. The schools for WAVES followed the pattern of those for navy men and were either established on the campus of a college or university or at a naval activity. The curricula at the specialized schools duplicated those set up for men in order that WAVES would be prepared to assume the same duties as men. In a number of cases, particularly in the aviation ratings and in advanced training for officers, WAVES studied at schools for navy men.

Duty of WAVES.-Shortly after V-J day the women's

WAYES and marines receiving instruction in control tower operation at Gordon field, Ga., in 1943

reserve reached its peak strength when there were a total of 8,000 officers and 78,000 enlisted women on active duty in 900 shore establishments throughout the continental United States and in the territory of Hawaii. At this time WAVES composed 18% of the total naval personnel assigned to shore establishments in the continental United States. They released 50,500 men for duty affoat or over seas and took over about 27,000 other jobs in the greatly expanded naval shore establishment service. Although WAVES were assigned to regular overseas duty only in the 14th naval district, they were also on temporary duty in such places as Alaska, the Aleutians, Puerto Rico and Bermuda.

The largest group of enlisted women were seamen, who filled a variety of billets which ranged from serving as general office workers to acting as film projectionists and chauffeurs. Thirty-eight ratings were open to enlisted women, with approximately 14,500 WAVES serving as yeomen. Others included storekeepers, radiomen, specialists, telegraphers, electrician's mates, cooks, bakers and printers. Approximately 30% of the WAVES were assigned to naval aviation. They repaired planes, packed parachutes and collected weather information. WAVE link trainer instructors gave lessons in instrument flying to approximately 4,000 men a day. Under the guidance of WAVE gunnery instructors additional navy men learned the essentials of aerial gunnery. WAVES directed air traffic from control towers and served as flight orderlies on almost all Naval Air Transport service routes in continental United States as well as on the Bermuda and Hawaii runs.

Getting supplies to the fleet and to the advanced bases, paying navy personnel and accounting for the expenditures of the navy were the primary duties of 1,000 WAVE officers assigned to the supply corps. Also assisting in the work of supplying the fleet were several thousand enlisted women, storekeepers, yeomen and seamen, whose work was identical with that of enlisted men on similar duty. The officers were assigned to general supply duties or to disbursing duty in which their responsibilities sometimes entailed expenditures aggregating millions of dollars each month. Supply corps WAVES became familiar with all types of navy materials, which ranged in variety from spare parts for plane engines to dry provisions. The majority of the WAVE officers served as line officers in billets which used their knowledge and training as administrators, language specialists, radio and radar technicians, lawyers, communicators and educational services officers. However, many officers were medical specialists serving as laboratory technicians, dental hygienists, occupational and physical therapists. There were 41 women doctors in the medical corps; two dentists in the dental corps and two women in the civil engineer corps.

WAVE officers in air activities included those who served as aerologists, assistant air transport officers and air navigation and link celestial navigation instructors. WAVE officers were designated as naval air navigators and were the first women officers in any United States military organization entitled to perform duties as part of a military air crew. They wore the wings of the naval air navigator on their uniforms. Of unusual interest was the increasingly important part played by women in the secret fields of technological research and development, particularly in the application of radar to the perfection of night fighter tactics and in controlled approaches and landings of aeroplanes.

WAVES in the hospital corps served in the wards, laboratories and offices of naval hospitals and dispensaries

throughout the United States and in Hawaii. At the peak of the women's reserve program in July 1945 there were approximately 13,000 WAVES in the hospital corps.

When the navy's demobilization plan was announced shortly after V-J day, women were scheduled to be separated from the service in the same percentage to total numbers as for the men. Separate centres were established for the women, and the point scores were lowered in order to complete the navy's plan for demobilization in an orderly flow by Sept. 1, 1946. (J. PAL.)

Wood, Sir Kingsley

Sir Kingsley Wood (1881-1943), British statesman, was admitted as a solicitor in 1903, entered public life as a London county councillor for Woolwich in 1911 and was elected to Parliament as Conservative member for Woolwich West in 1918, the year in which he was knighted. Between 1919 and 1929 he was parliamentary private secretary to various ministers of health; from Sept. to Nov. 1931 he was parliamentary secretary to the Board of Education in the national government. In Nov. 1931, he became postmaster-general and during his tenure effected many reforms which put the post office on a profit-making basis for the first time in many years. When Stanley Baldwin became prime minister in June 1935, Sir Kingsley was transferred to the ministry of health. He retained that office until 1938, when he succeeded Lord Swinton as minister for air. His policies and leadership in the air ministry were harshly attacked by both government and opposition leaders, and he was shifted to the post of chancellor of the exchequer in May 1940, where he was given the difficult task of financing Britain's war expenditures. Sir Kingsley died in London, Sept. 21, 1943.

Wood, Robert E.

Wood (1879-), U.S. army officer and business executive, was born June 13, 1879, at Kansas City, Mo. A graduate of the U.S. Military academy in 1900, he was on active duty in the Philippines the following two years. During the construction of the Panama canal, he was assistant chief quartermaster and chief quartermaster and director of the Panama Railroad Co.

He left the army in 1915 to engage in private business, but rejoined the service upon the entry of the U.S. into World War I and was promoted to the rank of brigadier general. Gen. Wood was acting U.S. quartermaster general in 1918-19. He re-entered business in 1919 as vice-president of Montgomery Ward and Co., in Chicago, and later joined Sears, Roebuck and Co., also in Chicago, as vicepresident (1924-28) and president (1928-39). He became chairman of the board in 1939.

Gen. Wood supported the Roosevelt administration in 1932 and 1936, but split with the New Deal in 1940 because he disapproved its foreign policy. Fearing that all-out aid to Britain would weaken U.S. defenses and involve the nation in war, he organized the America First committee to oppose intervention in the European conflict. He maintained his opposition to Franklin D. Roosevelt's conduct of foreign policy throughout 1940 and 1941, but after the Japanese attack on Pearl Harbor, Dec. 7, 1941, he gave

unqualified support to the government in its prosecution of the war.

Wool

Overproduction and the warlike situation in Europe caused U.S. wool prices in 1937 to decline 35% from the peak. Early in the year, expected government contracts for the army, navy and Civilian Conservation corps caused wool industrialists to make heavy purchases of cloth, with a backlog of 50,000,000 linear yd. of men's wear at the middle of the year—a continuance of the immense business placed during 1936.

Germany, at the same time, was acquiring wool and other import commodities by the barter system, principally from South America. In the U.S., strikes, tying up intercoastal boats, caused at one time 30,000 to 40,000 bales of Australian wool to be held at west coast ports. Heavy floods in the midwest and sit-down strikes in the automobile industry, together with strikes in wool warehouses in June, added to the general instability of wool prices.

Six months of depreciation in wool prices in 1938 were followed by six months of appreciation. The contemplated British Trade treaty, lowering the tariff on wool fabrics, noils and wastes, caused uneasiness among growers and manufacturers. The growers were especially alarmed by the adverse trend of wool prices and urged legislation to secure a commodity loan on wool through the Commodity Credit corporation. In Feb. 1938 the secretary of agriculture assured growers that such a loan would have favourable consideration. The wool market continued to slump. Loan terms were announced about June 1, halting the decline in values, and an upward trend took place on the theory that the loan had placed a floor on prices. The removal of \$10,000,000 worth of surplus clothing for relief distribution caused the market to become more liquid for the regular operators in wool textiles.

Hearings in May 1938 by the Adams committee, investigating practices in the wool trade, for the purpose of separation of consignment accounts from direct purchases, were held in Washington. Little evidence was brought forth to substantiate the claims of growers that they had been subjected to unfair practices in part. The Australian-Japanese agreement for the year commencing July 1, 1938, allotted 350,000 to 400,000 bales of wool for shipment to Japan. Germany continued to purchase large weights of wool in the South American market. In the U.S., the wool labelling, or "truth in fabrics," issue was again renewed.

The wool industry during 1939 was saved to a great extent by the outbreak of World War II. In the U.S. the wool textile business was retarded because of the threat of lowering textile tariffs in the British treaty. This threat did not mature, as the declaration of war by Great Britain and France turned practically all of their production of textile machinery into war work.

Upon the declaration of war in Europe, U.S. wool textile manufacturers realized that there would be a continuation of their home market for fabrics, and the probability of immense orders from the belligerents. Orders for wools at that time caused prices to advance 50% above the market prices of June 1. Every effort was made by England to continue its export trade, with fabrics on hand or in process, and to take over the German business previously obtained in South America and in South Africa. In the U.S., former importers of British fabrics placed orders with domestic manufacturers, causing a demand for domesticgrown wools. From Sept. 1 to 30, 1939, fine territory wools

jumped from 68 to 70 cents to \$1.05 to \$1.08, clean basis. Australia, in Dec. 1939, released 75,000 bales of wool, approximating 30,000,000 lb., for immediate shipment to the U.S. More than 100,000 bales of South African wools were purchased for U.S. use. Argentina shipped 46,500 bales and Uruguay 11,000, a total of over 55,000,000 lb.

In Australia, the British government agreed to purchase every bale of wool for the duration of the war and one year after. The customary auction sales were indefinitely postponed. In the U.S., the government announced the extension of the Commodity Credit corporation loans on domestic grown wools to Feb. 15, 1940. Prices advanced considerably in the west. In September, the British government set up the English Wool Control plan with full control of all wool stocks in England, these stocks to be allocated directly to individual manufacturers. The Australian Wool commission established 848 different types of Australian wools.

The discouraging daily reports received from the battle fronts in Europe similarly affected the wool market during the first six months of 1940. Machinery output in U.S. mills was woefully below normal, and the lack of business had forced a number of small mills to shut down. The New York buyers of wool fabrics made but few commitments and only enough yardage to cover immediate needs. The rapid thrusts by the nazis through the Low Countries and France caused deep apprehension throughout England. This fear spread to the U.S., and Washington decided to conscript manpower as a protective measure against possible invasion, should England be attacked by invading forces. Congress went into action immediately, appropriating huge sums for the proper equipment of its army and navy. It was figured that it would take 10 sheep, growing approximately 75 lb. of wool, to clothe one soldier.

Start of U.S. Army Purchases.—As soon as the appropriations were signed by Pres. Roosevelt, the army requested bids for clothing and blankets. On June 13, 1940, the Quartermaster depot in Philadelphia announced that bids were to be opened for 10,500,000 yd. of overcoating, serge and shirting. The wool market immediately reversed itself from its previous position earlier in the year. At the same time, the British government negotiated for U.S. storage space for 250,000,000 lb. of Australian wool, to be held as a strategic reserve.

In August the Quartermaster depot advertised for bids on 1,000,000 blankets, later increased by 200,000. During the same month, invitations were published to furnish 8,000,000 yd. of material requiring 16,000,000 lb. of grease wool. Shut-down mills immediately reopened to secure a portion of this immense government business. These orders instilled confidence in the New York goods market, and civilian business in volume was resumed. Awarding of these government contracts showed that 70% of the men's wear business in the mills was scheduled for the army and navy. On Oct. 1, less than 10% of the season's domestic wool clip was unsold.

On Oct. 9, 1940, the army opened bids for an additional 2,000,000 blankets, requiring over 8,000,000 lb. of scoured wool. The following day the Quartermaster depot issued invitations to bid on 18,000,000 yd. of flannel, olive drab serge and elastique. On Oct. 11 the top futures exchange reacted to these purchases by an advance of 19 to 55 points. On Dec. 5 orders for 13,000,000 yd. of materials, specifying the use of foreign wool, were announced. These wools included those grown in Australia, South Africa and South America. Wools were cheaper in these markets, especially

in South America, compared with the prices of U.S.-grown wools. This was due to the impossibility of shipping wools from these markets to England and approved nonbelligerents on account of the submarine menace and blockades. Thus, only the market in the U.S. remained open for reasonable shipment. Because of the demand for South American wools, more than 50% of the season's clip was sold between Nov. 15 and Dec. 31. The bulk of the government orders for uniforms called for 18 oz. of serge, 32 oz. of overcoating and 18 oz. of elastique.

During the first six months of 1941, U.S. wool textile manufacturers were busy on orders placed during the last quarter of 1940. This heavy backlog of orders placed by the government, together with civilian requirements, placed the manufacturers in a very strong position. Buyers for civilian fabrics found but little idle machinery available for their needs. Approximately one-half of the 55,000,000 yd. of fabrics included in the backlog of orders was for men's wear which was held up by the precedence of government orders. The manufacture of women's wear suffered to a similar extent. Unfilled orders exceeded by 50% those of a year previous. The prospect of additional orders for the defense supplies caused the mills to withhold any offerings of fabrics for civilian purposes. During the month of May, U.S. mills were producing 4,000,000 yd. of fabric weekly.

The trade agreement with Argentina in Oct. 1941 reduced the tariff on lower grades of wool shipped from that country. Japan, a few months prior to Pearl Harbor, had freighters in seaports of Peru and Chile, loading all types of commodities, including wool and alpaca. The Defense Supplies corporation, a subsidiary of the Reconstruction Finance corporation, completed negotiations with the British government to transfer ownership of 176,000,000 lb. of British-owned wool stored in the United States or afloat.

Huge Military Demands.—The outbreak of war with Japan in Dec. 1941 resulted in a withdrawal of offerings of wool piece goods in New York, with the belief that the bulk of the textile machinery would necessarily be confined to government fabrics to equip at least 5,000,000 men. There was talk at this time of the government's taking over all wool supplies. The Office of Price Administration announced the temporary establishment of ceiling prices of wool and wool fabrics based on the approximate level of prices in effect during the period of Oct. 1 to Dec. 6. Immediately after the declaration of war with Japan, added names were appended to the British list of blocked nationals, the so-called blacklist of names considered by both governments to be within the Trading with the Enemy act. Prices remained fixed on wools in Australia, New Zealand and South Africa. The rise in war risk insurance did not stop U.S. purchasing of wools in these markets.

Orders for army cloth for the year amounted to 88,748,257 yd. and 5,848,784 blankets, with the navy and marine corps taking 3,355,000 yd. and 384,000 blankets. Wool consumption in the U.S. was 1,018,553,000 lb., as compared with a normal peacetime consumption of approximately 600,000,000 lb.

During 1942, wool was considered as a strategic material by all nations engaged in the global war. As such, free trading was stopped and was controlled for home use and export by the nations involved. The wool producing countries in South America were free to trade with the world on this commodity, but because of the circumstances of the times could ship only to the U.S. Some wool was shipped to Sweden from South America in ships flying the Swedish flag and having the required British navicert. A few ships

carrying large weights of wool destined for Germany were seized by British and U.S. patrols, and the cargoes were confiscated.

At the beginning of 1942, the transition from defense to actual war economy took place. The OPA issued maximum prices on shorn wool, effective Feb. 28. Mills, under adjustment to the conservation program, experimented with substitutes for virgin wool. The use of 100% virgin wool for civilian fabrics was restricted during the year because of greater military requirements. During the period from Aug. 3, 1942, through Jan. 31, 1943, worsted manufacturers were permitted to use not in excess of 25% of such basic poundage for the manufacture of fabrics and yarns of any wool content, and an additional amount of wool owned, not in excess of 30% of such basic quarterly poundage, for fabrics containing not more than 65% wool. For woollen manufacture an amount of wool not in excess of 5% of such basic quarterly poundage could be used for the manufacture of fabrics and yarns, with an additional amount of wool, not in excess of 25% of such basic poundage, for the manufacture of fabrics and yarns containing not more than 65%.

War risk insurance rates on wool reached a peak of 25%, principally because of the submarine menace, but were reduced later in the year to 121/2% as sinkings by submarines lessened. Insurance was established by the U.S. government at 11/2% up to 4%, thus re-establishing heavy purchases of wool in Australia, South Africa and South America. Orders placed in March by the government called for 74,182,000 yd. of woollen and worsted fabrics, 10,000,000 blankets and 10,000,000 pairs of wool socks. A reciprocal trade agreement between Peru and the U.S. included the reduction in duty of alpaca, used extensively in the manufacture of aviators' uniforms. An agreement between the U.S. and Uruguay was ratified in Washington, wherein the U.S. agreed to purchase from Uruguay a part of the 1941-42 and 1942-43 wool clips, covering 30,000 bales of the older clip and 37,500 bales of the newer clip, providing the latter was unsold by June 1, 1943.

In Dec. 1942, the secretary of agriculture assumed full control over the U.S. food program (wool being included). The government's stock pile of wool was announced to be 450,000,000 lb., principally Australian, New Zealand and South African. Of this, 33,000 bales, or 11,000,000 lb., of Australian wool were sold by public auction in Boston during December. In addition to this holding, there were 225,-000,000 lb. in storage intended for transshipment to the United Kingdom. The War Production board's general imports order M-63, covering government control of shipping space for the importation of strategic materials, including wool, required importers to obtain the necessary authorizations or licences to import wool. These licences were granted only on grades of wool, including certain types of alpaca and wool-wastes, suitable only and deemed necessary and appropriate in the public interest and to promote national defense.

U.S. wool consumption during 1942 amounted to 1,021,200,000 lb. of greasy, 22% of which was for civilian fabrics and 78% for military. An army blanket required 101/2 lb. of shorn wool; 1 yd. of 18 oz. serge, 41/2 lb.; 1 yd. 32 oz. melton, 31/6 lb.

The year 1943 again showed a consumption of over 1,000,000,000 lb. of wool in the U.S. In bids for government fabrics, preference was given to those containing domestic-grown wool. Nevertheless, of the 445,000,000 lb. of scoured wool consumed during the first three-quarters of the year, the National Association of Wool Manufacturers reported that 37% was domestic and 63% imported.

CCC Control.—To assure the effective distribution of wool for the fulfilment of war and civilian requirements in the U.S., the War Food administration, in 1943, issued an order requiring that U.S.-grown wool not sold prior to April 25 should, with certain exceptions, be sold to and purchased only by the Commodity Credit corporation. The order applied to both shorn and pulled domestic wool, the wool being purchased through handlers on the basis of ceiling prices, less handling costs. It then would be sold directly to manufacturers at ceiling prices. In addition to the purchase of approximately 250,000,000 lb. of U.S.grown wool, an additional amount of foreign-grown wool was purchased by the government. This stock pile consisted of 290,000,000 lb. of Australian, 6,000,000 of Argentinian and 32,000,000 of Uruguayan, 20,000,000 still remaining in Uruguay at the end of 1943. The total of 328,000,000 lb. of foreign wool did not include an estimated amount of 525,000,000 lb. of Australian, New Zealand and South African wool owned by Great Britain and stored in the United States. This large accumulation of wool was held in storage in the United States for British use should the mills in Yorkshire become incapacitated through German action. Low priced wools from South America, in comparison with domestic wool prices, were attractive to importers, and sizable orders were placed. Deliveries were slow on account of the scarcity of ship bottoms and other circumstances. The War Production board stopped shipments in March from South America of 44s quality and below, and finer than 58s, because shipping space was badly needed for other strategic materials, and the lower and finer qualities of wools from South America were not deemed necessary for the war effort.

The surrender of Italy in Sept. 1943 accentuated a conservative feeling throughout the trade. Manufacturers faced demands for civilian goods over and above those which could be filled, pending calls for military and lend-lease fabrics.

Overoptimism concerning the possible end of the war in Jan. 1944 caused many manufacturers to accept sizable civilian orders. The estimated early defeat of Germany did not take place, however, and by the end of the year these same mills were more concentrated on military goods than at any time during the previous war period. Shortage of manpower affected the mills. New machinery and parts for repairs were practically unobtainable. Necessary soaps and oils were scarce, causing bottlenecks in scouring and in topmaking. This was the fourth successive year in which over 1,000,000,000 lb. of wool was consumed in the United States.

On Jan. 18, 1945, the Defense Supplies corporation offered 1,900,287 lb. of greasy and 3,620,859 lb. of scoured Uruguayan wool by auction. This lot of wool was understood to be originally destined for axis accounts. Statistics showed that the use of imported wool amounted to 64% and domestic 36%. Large military supplies were lost during the "battle of the bulge." New government orders were immediately placed for early delivery, disrupting mill plans for civilian output. With large supplies of the merino type of wools in Australia and South Africa, these orders caused continued activity in these primary markets. The larger amount of business was placed by the U.S. in Australia because of speedier deliveries. Orders for wool placed in both the Cape and South America were taking from five to six months for delivery.

Australian and other foreign apparel wools could be imported into the U.S. at 10 to 20 cents lb. clean basis,

including the duty, which was under the ceiling prices in force of domestic-grown wools. The growers in the U.S. urged a centralized control of foreign and domestic wool under one control. The so-called "Hıll plan" was offered as another expedient in the manipulation of foreign wools brought into the U.S.

The world wool surplus was estimated to be 2,500,000,000 lb. at the close of 1945. The stock pile of domestic-grown wool was estimated to be slightly under 300,000,000 lb.

Reconversion.—In 1945 the consumption of wool in the U.S. again showed the use of over 1,000,000,000 lb. The mills used approximately 90% of imported wools, because of lower conversion cost and higher yield. After the defeat of Germany in May, the government demands for wool fabrics subsided. By the end of November, 400,000,000 lb. of domestic wool were on hand from the three clips commencing in 1943. In Aug. 1945, after the capitulation of Japan, the manufacturers looked ahead to reconversion of their plants for postwar needs. Wartime orders not in process were immediately cancelled, but there still remained a bottleneck in scouring and combing, as well as time spent in making suitable samples to offer for the civilian trade.

During April and May the British empire group laid the foundation for the orderly marketing and disposal of the war-controlled surplus of wool and the forthcoming clips. A long-term basis was agreed upon for the disposal of these surplus wools, estimated to take at least 12 years to market. It was shown that as of June 30, 1945, there were approximately 3,315,000,000 lb. of United Kingdom owned wool on hand, of which 3,245,000,000 lb. were of dominion origin. Auction sales were recommended as the best medium of marketing this accumulation, and it was expected that the dominions would begin theirs soon after July 1, 1946, and in London prior to that date.

The surplus stock of wool owned by the U.S. government at the end of 1945 amounted to 425,000,000 lb. This consisted of the balance of the 1943–45 clips purchased by the Commodity Credit corporation at established ceiling prices and resold on the same basis. During the week beginning Nov. 26, a new price schedule took effect, lowering the established ceiling prices from 15 to 20 cents clean basis.

A general strike in the woollen and worsted mills was threatened at the beginning of 1946. The New York Western Union strike delayed cable service to Great Britain and the wool centres in South America and South Africa. Manufacturers were hesitant to make wool purchases because of the uncertainty in the labour situation.

As of Jan. 7, 1946, the Commodity Credit corporation reported its unsold stock of domestic-grown wool as 419,-115,000 lb., although nearly 22,000,000 lb. had been sold since Nov. 27 of the preceding year, when prices were reduced. Total purchases by this bureau from the beginning of the 1943 program to Dec. 15, 1945, aggregated 895,000,000 lb.

World competition brought about great changes in the wool supply. Australia sold 300,000 to 400,000 bales to France during two weeks in Jan. 1946. The U.S.S.R., Holland and Spain purchased large weights in South America, causing the market in Montevideo to advance 10% almost immediately. U.S. orders placed in Australia during the 7 months ending March 31 totalled 1,408,350 bales or approximately 460,000,000 lb.

Considerable interest was shown in a proposed U.S. government policy on domestic wools, as prepared by the departments of agriculture and commerce. Under this pro-

posal, wool parity prices would be advanced to a level equivalent to other farm products. Many favoured a direct subsidy on sheep to continue to encourage production of wool

Large weights of foreign wools were re-exported to Italy and to other European countries from the United States. Considerable barter business was being done, exchanging the raw material for yarns or finished fabrics. Mills on the continent were running at 60% of capacity, with labour supply best in Italy. The wool manufacturing industry was practically undamaged in France, Belgium and Italy. The British mills, at the middle of the year, had 158,000 wage earners, with an additional 66,000 needed to restore the prewar complement of 224,000.

The return of auction sales commenced in Sept. 1946 at the various centres in Australia, South Africa and London. Continental competition for these wools caused them to advance from 10% to 20% above the former issue prices of June 30. Ceiling prices in the U.S. were decontrolled on domestic-grown wool by the OPA, but controls were maintained over foreign wools under a regulation which held that, while products might be judged to be agricultural if produced domestically, they did not necessarily come under that category when produced abroad. Woolton, 1st Baron

Baron Woolton (Frederick James Marquis Woolton) (1883—), British economist, businessman and government official, was born Aug. 24, 1883. Educated at Manchester university, he was awarded a research fellowship in economics by that institution and became warden of the university settlement in Liverpool. Later, he started the first children's dental clinic in Liverpool and with his wife inaugurated the city's first prenatal clinic.

During World War I, Woolton, who was rejected as medically unfit for military service, joined the war office and became secretary of the Leather Control board. After the war, he went to the U.S. for a study of industrial conditions and on his return he joined the board of Lewis, Ltd., a department store. He became managing director in 1927 and chairman of the board in 1934. He was raised to the peerage as 1st Baron Woolton in 1939.

In early 1939, he joined the war office as director-general of equipment and stores and in April 1940, he was appointed minister of food. Winston Churchill named Woolton to the post of minister of reconstruction in Nov. 1943. Woolton was lord president of the council from May 1945 to the accession of the Attlee government in the following July.

Words and Meanings, New

The words listed in this article were chosen as most typical of the years 1937–46 from some thousands which came into the English language during that period, either by coinage, by extension of meaning, by new combinations or by borrowing from other languages.

The words became prominent or were seemingly used for the first time during the decade 1937–46. Dates within the parentheses following a word or definition indicate the first recorded use of the new word known. A preceding hyphen means that the word or meaning is at least as old as the date given.

In general, the new words of 1937 reflected unrest—dissatisfaction with working and living conditions follow-

ing a long period of economic depression and widespread unemployment. Some of the new expressions revealed a desire for security, as in government pensions for the old. There was a new feeling of hemispheric solidarity as turmoil increased in Europe. On the other hand, much advance in science was indicated by the many coinages in the fields of aviation, radio, motion pictures, chemurgy and the new synthetics.

In many cases, the individual word or term was first used prior to the year of the listing in which it appears. It is included in that listing, however, because it became prominent or generally definable in that particular year.

1937

Airacuda. An experimental bimotored fighter-bomber built by Bell Aircraft corporation for the U.S. army air corps. Named for the ferocious barracuda.

ad lib, v. i. & t. To speak lines not in the script during a radio broadcast (-1937; older in theatre); to insert a "lick" in playing a jazz music score. (-1935) Colloq.

air poll. Survey of radio program popularity, with listeners checked by a device called a radiovoter.

Ambassador-at-Large. A representative of the United States on a special mission abroad.

artificial heart. The Lindbergh-Carrel mechanism for medical experiments in blood circulation. Also glass heart and robot heart. (1936)

audition, v. i. & t. To compete in any sort of trial, as ice-skating. Originally a trial of a candidate for employment as a vocalist or instrumentalist.

avoidance of taxes. To be distinguished from "evasion of taxes." The U.S. treasury published the names of 67 wealthy taxpayers who "avoided" full payment of taxes by transferring personal assets to corporations.

bacteriological warfare. The spreading of pestilential germs endangering the enemy's life, both directly and through his food and water supply. First employed in 1340's against Turks by the Tartars, who catapulted corpses of Black Death victims over city walls. Also germ warfare.

bank night. A copyrighted form of lottery in motion picture theatres with prizes awarded to members of the audience previously registered. Banknighter. The winner in such a lottery. (-1935)

barrelhouse. Playing without regard for what others are playing in a jazz orchestra. Slang.

Battey Ball. A form of paddle ball which was a national fad of 1937. Also Bo-Lo, Fli-Back, Hi-Li, Rapatap, Rick-Rack, Sockit.

Bauhaus, New. A school of design opened in Chicago in 1937, based on the ideas of the German school. Also American Bauhaus.

Bemberg. Trade name of a rayon fabric made by the cuprammonium process.

B film. A film produced quickly and cheaply, without star performers, with routine plot and treatment.

bingles. Token money paid by the U.S. government to settlers in Matanuska valley, Alaska.

blind landing. An aeroplane landing with the pilot guided wholly by the radio homing-type compass. See DF.

boogie-woogie. A type of jazz music characterized by free improvisation in the treble range against a pronounced rhythm bass.

bracket, high- and low-, n. Those bracketed together as of the same age, size, price, amount of income, etc.

break, n. & v. Those improvisations distinguishing "hot" jazz music from "sweet." They broke from the basic melody, and each solo was a "lick" for some player. Slang.

broken homes. Those homes disrupted by divorce.

Brown Shirt. (Ger. Braunhemd.) A member of the Sturmabterlung, in nazi Germany.

Bund, The German-American. A pro-nazi organization in the U.S., formed in 1936 as the *Amerikadeutscher Volksbund* with a "culture centre" at Camp Siegfried, L.I.; headed by Fritz Kuhn.

camelback. An uncured compound of rubber for mending pneumatic tires. (-1937)

candid-camera. A small camera for taking unposed photographs. Legislation was urged to curb its use. Also, candid-cameraman, -craze, -fan.

captive mine. A coal mine owned and operated by a large industry consuming the entire output. Opposed to domestic mine.

cash-and-carry-provision. A clause in the Pittman Neutrality act requiring nations at war to pay in cash for and to transport goods bought from the U.S.

ceiling. A maximum limit on prices, wages or hours, fixed by the government as legal. Opposed to floor.

chemurgy. Chemical utilization of farm products in industry. Term coined in 1935 from chemistry plus ergon (Greek for work). Also chemurgic and chemurgical.

coaxial cable. An insulated cable used to transmit telegraph, telephone and television signals.

commercial, n. Radio entertainment paid for by advertisers. Opposed to sustaining program.

commercial band. A large well-known jazz band playing "compromise swing"; opposed to serious jazz players.

composite. A seaplane for ultra-long-range flights, consisting of two aeroplanes, one mounted on the other's back and released therefrom in flight.

compressibility burble. A disturbance of the airflow as a plane approaches the speed of sound.

contact lens. Thin plastic lens fitting invisibly over the eyeball and moving with it; designed to correct errors of vision.

court-packing. President F. D. Roosevelt's proposal to add a new justice to the U.S. supreme court for every existing member who persisted in sitting beyond the permissible retirement age of 70 yr. See Nine Old Men.

crop control. Secretary of Agriculture Wallace's system of limiting planting and fixing prices of farm crops. Farmers who accepted the plan were called co-operators.

cyclotron. Atom-smashing machine invented by Dr. E. O. Lawrence, of the University of California in 1932.

Dead End. A grimly realistic play and film on juvenile delinquency, in New York's slums; by extension, used to describe underprivileged, delinquent children.

death sentence. Section 11b of the Securities and Exchange Commission's Public Utilities act, limiting the operation of utility holding companies, effective Jan. 1, 1938.

de-icer. An air-driven device to melt the ice forming on the wings and tail surfaces of an aeroplane in flight. Also de-icing overshoes. (1934)

DF. (Direction-finder.) A radio device located on the ground to guide a plane from any point within transmitting range. (-1928 in England)

Du Prene. Trade name for a synthetic rubber manufactured by du Pont. (1935)

dust bowl. a region suffering from prolonged drought and dust storms; *specifically*, the western border of the great plains from 1934 to 1937.

economic rent. Cost of interest, amortization and maintenance of property. Opposed to social rent, the sum which low-income families can afford.

economic royalist. One believing himself superior by virtue of wealth. (-1936) Also ducal economic overlord, and tory.

Eire. Ireland, an independent and sovereign republic, superseding the Irish Free State. Pronounced Airy.

electroencephalograph. An apparatus for detecting brain activity and recording it on a visible screen.

emcee, n. & v. To act as master of ceremonies at a night club, on a radio program, etc. Also M.C.

epiallopregnanolone. Male hormone No. 3. Also EAP. Epok. Outdoor advertising sign operated by photoelectric cells, showing a series of animated cartoons. See spectacular.

estrone. One of the most important female sex hormones. Also oestrone.

ever-normal granary. The plan of Secretary of Agriculture Wallace to maintain a federal reserve or reservoir of such crops as cotton, corn, wheat, rice and tobacco to equalize shortages and surpluses.

facsimile broadcasting. A method of transmitting the printed page, with maps and diagrams, by radio and of reproducing them in the home or office. See wirephoto.

Fair Trade Act. Miller-Tydings act prescribing a minimum price for the resale of a commodity bearing the trade-mark of the manufacturer.

fever therapy. The treatment of disease by artificially induced fever called machine fever. Also, fever cure.

fifth column. General Franco's sympathizers within Madrid (General Emilio Mola); thus, those who seek to undermine a nation in the interests of a foreign power. fighter. A military pursuit plane.

fireside chats. President Roosevelt's informal radio addresses in which he appealed to the people for support of certain measures. (1936)

flight recorder. An aeroplane device to keep automatic records of altitude, use of the plane's radio transmitter and reception of beacon signals. Also flight analyzer.

floor. A minimum level, as of prices, wages, hours of work. Colloq.

Flying Fortress. Boeing trade-mark for Model 299 fourengine bomber. Also destroyer of the skies, flying dreadnought, etc. (1935)

flying laboratory. Experimental aeroplane to test new safety devices, flying fatigue of aviators, etc.

freeze. To fix by order, as prices, wage scales, capital.

frequency modulation. A system of radio transmission depending upon controlled variation of wave frequency, as opposed to the conventional system of varying wave amplitude. Frequency modulation virtually eliminated static and offered listeners very high fidelity. Also, FM.

Gestapo. (Ger. Geheime Staatspolizei.) The nazi secret police.

Good-neighbour policy. President Roosevelt's policy of friendship and business co-operation with the Latin American countries and Canada. (-1933)

goon. A labour union representative using violence and illegal coercion. Slang.

grass-roots Republicans. The "People's party," embracing all kinds of Republicans from old guardsmen to labourers, with Glenn Frank as chief in 1937 (name itself possibly dated from the 1920s).

groove, in the. Descriptive of swing music played in an inspired fashion; later applied to persons. Also groovey, going to town and out of this world. (-1936) Slang.

guinea pig. The subject of any sort of experimentation. gutbucket. "Low-down" jazz music. (-1936) Slang.

halter. The upper half of a woman's abbreviated swimming suit; or any woman's sport blouse designed for maximum legal skin exposure.

heavy electron. An atomic particle believed to constitute a large part of cosmic rays. Also X particle.

hep cat. A swing music addict. (-1936) Slang.

horse opera. A "western" film, or any melodramatic thriller. Also hoss opera.

Horst Wessel song. Official nazi rallying song, composed by Horst Wessel, most famous nazi martyr. (-1933)

hot jazz. A series of variations on a basic theme, often improvised, played or sung with gusto. (-1935)

hot money. Foreign capital invested in the U.S.

hydroponics. Growing of plants in nutrient solutions for commercial purposes. Also tray agriculture.

ickie. One pretending to like jazz but having no knowledge of true jazz. Opposed to jitterbug. Slang.

incident. Undeclared or unauthorized war, border clashes; especially, Japanese and German aggression, as the Mukden incident and the Panay incident.

Isograph. A machine for solving complex equations, invented by Dr. T. C. Fry.

ivory hunter. Personnel officer of a business firm interviewing likely candidates on college campuses.

jam, n. & v. i. Free improvisation in swing manner against a rhythm background; to make music in this fashion. jam session—An unrehearsed, unplanned, experimental ensemble performance by ruggedly individual swing musicians. (-1936) Cant.

jitterbug. A person genuinely receptive to swing and interested in its technique. Also one gesticulating wildly while dancing. *Collog*.

Keedoozle Stores. A chain grocery system composed of self-service stores employing key-operated electric vending machines.

Kinescope. Trade name attached to a form of cathode ray tube capable of converting streams of electrical particles into visible images. Used in one form of television system.

Koroseal. Goodrich's translucent flexible synthetic material. Also rubber glass.

lanital. An artificial wool made by Italian chemists from skimmed milk.

Liberty League, American. A conservative political group, organized in 1934, which fought the New Deal in the 1936 presidential campaign. Also, Liberty Leaguer and Liberty Leaguish.

liquidate. To kill secretly and ruthlessly, as in the soviet "blood purge."

Little TVA's. Seven proposed federal power projects similar to the Tennessee Valley authority, including the Columbia valley, the Cumberland and the Nebraska. See Regional Planning.

loss leader. Any article advertised for sale below its cost as a means of drawing customers who might buy other goods offered at profitable prices.

Lucite. Trade name of du Pont's transparent synthetic resin (polymerized methyl methacrylate). Known also as firefly glass.

minicam, n. & v. Short for miniature camera. As a verb, to photograph with such a camera.

neutrino. A light, chargeless particle of smaller mass than the neutron.

newscaster; sportcaster. A reporter broadcasting news or sporting events.

Nine Old Men, The. U.S. supreme court justices over 70 years of age, whom President Roosevelt wished to replace on grounds of their being overaged.

nonobjective, n. An abstract art form characterized by bright colours and avoidance of all physical symbols and associations. Also nonobjectivist, n. The artist. (1930)

off-the-record, adj. Not for publication; as of information given out in confidence by government officials during informal press conferences, etc.

Oscar. The annual award for excellence in directing or acting in motion pictures. (-1936)

parachute infantryman. A soldier trained and equipped to descend from the air behind enemy lines; first demonstrated by the soviets at their army manoeuvres near Kiev in 1935.

photomontage. A composite picture, made up of several individual photographs.

pilot error. A mistake in judgment responsible for an aeroplane accident. Flying fatigue caused by oxygen deficiency at high altitudes was held responsible for many such errors.

platter. A phonograph record. Also wax. Slang.

plexiglas. A transparent plastic material (methyl methacrylate) used in military aircraft in place of window glass.

Pliofilm. A trade name for a thin transparent rubber hydrochloride, used for raincoats and packaging material, manufactured by Goodyear. (-1936)

Polaroid. A trade name for a light-polarizing plastic material, used in eyeglasses, windshields and lamps as a glare-preventive. Also anti-glare, adj.

pressure-cabin. A sealed aircraft-cabin in which the atmospheric pressure is kept at normal ground pressure by a cabin-supercharger or pressurizer.

pulps. Magazines printed on rough-surfaced paper, and commonly devoted to crime, mystery, gangster and "spicy" detective fiction. Also pulpwood magazines, and pulpdom. Opposed to slicks. *Slang*.

quarantine, v.t. To segregate, boycott, or otherwise engage in specific punitive action against a nation. President Roosevelt made the term famous in his speech of Oct. 5, 1937, at Chicago, when he recommended quarantining "aggressor nations."

quick-freeze, v.t. To freeze food in a special high-speed refrigerator for storage or transportation. Clarence Birdseye, inventor of the frozen foods process, sold his rights to General Foods corp. in 1929.

quickie. A sit-down strike of labour. (-1936) Slang.

reefer. A cigarette containing the dried leaves and flowers of marijuana. Also bennys, Mary Warners, muggles, etc. Slang.

Regional Planning Bill. Original plan was to include seven power-producing Little TVA's. (Tennessee Valley Authorities.)

reliefer. An unemployed person on federal government relief rolls. Also relief client.

roadable aeroplane. The Waterman Arrowplane corporation produced a combination automobile and aeroplane called an *Arrowbile*. (The wings of the aeroplane were detached for road use.) A roadable autogiro was produced in 1936.

Rome-Berlin axis. An alliance entered into in 1936 between Italy and Germany.

Sanforizing. A mechanical patented process of preshrinking woven materials. Named after the inventor, Sanford Cluett. (1929)

schmaltz, n. & v. (Ger. Schmalz, grease, fat.) A derogatory term to describe playing jazz in a "sweet" or sentimental style. (-1935)

schuss, n. (Ger. shoot.) A straight, high-speed run in skiing. (1936)

send, v. To communicate the personal excitement of the swing musician to his listeners through inspired improvisation or "licks." Cant.

shadow, n. A skeleton or outline ready to be completed when needed, as a shadow factory or government. (-1936) Collog.

short. A short subject in a moving picture program, as a Disney short. Also film short.

sit-down, n. & v. A labour strike in which the workers cease work and refuse to be ousted from the place of employment. Also sit-in, show-down, lie-down. Sit-down strikers were called sitters, sit-downers, or trespassers. (-1936) A possible origin of the term was traced to a strike in the General Electric plant in 1906.

smear campaign. Personal political attack. Also whispering campaign and whispering campaigner. Slang.

spectacular. A large outdoor advertising sign. Also Wondersign, trade name.

sponge rubber. Foamed latex for use in the cushions of upholstered furniture and mattresses; opposed to cast rubber.

sterilization of gold. The buying of imported gold by the U.S. federal government for the purpose of holding it in reserve to prevent glutting of U.S. bank reserves. Also insulation.

streamliner. Streamlined railroad train.

strip tease, n. & v. A burlesque dance act wherein a supposedly beautiful girl slowly struts across the stage, disrobing as she goes. Also, strip-tease and strip-and-tease, adj. Slang.

strong man. A leader in politics, sports, etc. Also, strong-man, adj.

sulfanilamide. A white crystalline compound, discovered in 1935, used successfully in the treatment of bacteria-caused diseases.

superfortress. A four-motored bombing plane built by Boeing.

sustainer. A sustaining program paid for by a radio network rather than an advertiser.

swing. n. A style of playing dance music which subordinates melody entirely to improvised variations. Opposed to sweet. Swingster, an advocate of swing music. Also, swing band and swing fever.

Technicolor. A patented process of making movies in natural colour; first developed in 1915 but not made commercially practical until 1937.

Thiokol. A synthetic plastic rubber manufactured by the Dow company. (-1936)

Third Reich. (Ger. Das dritte Reich, the third empire.) The German totalitarian state, established in 1933.

tin ear. Term applied to a jazz player with poor intonation and with a mechanical method of playing. (-1935) Slang.

total war. War waged with all a country's available resources and against the total population and resources of the enemy. Opposed to limited or defensive war.

Townsendite. Member of the Old Age Revolving Pension, Ltd., advocating a monthly \$200 pension for person over 60 years of age not in active employment. Also Townsendeer, Townsender, Townsendist. (-1936) The Townsend Clubs were founded in 1935.

trailerite. One traveling in a trailer cottage, an automobile-drawn home. Traileritis, a name for this mode of living.

trucking. Dancing (usually to swing or jazz music) with a shuffling step.

ultraviolet ray screen. A barrier or screen of germ-killing ultraviolet rays created by a special lamp; used to protect the rest of a hospital from its contagious wards.

unemployment census. A registration conducted by the federal government to determine the number of unemployed in the United States.

workshop in education. An informal study group organized to help teachers apply the principles of "progressive" education to the solution of their own educational problems by the laboratory method. Also, workshopper. (-1936)

1938

Prominent among the new words of 1938 were many relating to war—air-raids, blackouts, gas masks, the scorched earth policy, conscription. Science had been stimulated by approaching war and its needs; thus many of the new terms dealt with the results of experiments with the atom and with medicine. A new preoccupation with race was shown, because of the conflicts of nations.

* * *

air-mass theory of weather. The Bjerknes theory; used successfully by the Germans in military aviation and by most U.S. air lines as the basis for forecasts and dispatching.

air raid shelters. Steel and cement structures used as protection against enemy bombing and gassing, in London, Paris, Leningrad and many German cities. Also bomb shelters, bombproof shelters, shelters.

amphibian. Amphibious tank built for use in marshlands.

area tactics. A military strategy, used by Chiang Kaishek's army, of filtering into unprotected enemy territory. badman. Gangster or desperado.

balloon barrage. British system of balloons and steel cables used to guard key cities from attacks by low-flying enemy aircraft.

barytron. A sub-atomic particle whose electrical shifts give off energy to cement atoms together. Or, a heavy electron.

bathinette. A combined dressing table and tub for babies. battle wagon. A battleship. Slang.

Benzedrine. Trade name applied to amphetamine, a synthetic drug closely related to certain gland secretions, used as a nasal inhalant and as a stimulant producing alertness and wakefulness.

Big Apple, n. & v. A dance, adapted by college students from the highly imaginative dancing of Negroes, which took the United States by storm and also became popular in England.

blackout, n. & v. An air raid precaution in which all lights are extinguished or covered.

blanketing of a radio station. Silencing of a station by a more powerful station. Fig. Censorship, as of war news. blind bombing. Haphazard dropping of small projectiles from above cloudbanks.

blitzkrieg. (Ger. lightning war.) A German method of war first suggested by Von Moltke and later evolved in detail by General Hans von Seeckt. Blitzkrieg involved the concentration of mobile troops, devastating air raids, together with shattering attacks of all manner of armoured vehicles.

blue-ribbon grand jury. A panel of jurors selected for special qualifications, such as alertness, intelligence and common sense. Also Blue Ribboners. Colloq.

brain wave. Electric current generated by a human brain cell. An instrument tor measuring brain waves was invented by Hans Berger in 1929. See electroencephalograph, in 1937 list.

breakdown, n. An analysis or classification. Break down, v. To analyze or classify.

Chicago piano. An eight-barreled "pom-pom," or rapidfire, anti-aircraft gun. Slang.

Chicago Plan. A system of higher education advocated by certain faculty members of the University of Chicago, providing for four years of broad cultural training, to be followed by two years of specialization in the student's chosen field.

class. A group of conscripts becoming eligible for military service in a given year.

closed end trust. An investment trust whose securities have no right of redemption. Opposed to open-end.

cold Anschluss. Term applied by some newspaper correspondents to Hitler's bloodless conquest of Austria.

commentator. In radio, one who broadcasts news summaries, with or without comments.

Corrigan, Wrong Way. A nickname for Douglas Corrigan, who flew to Ireland in a decrepit plane without the authority of the U.S. department of commerce. Also Nonstop Corrigan and On again, off again, up again Corrigan. To do a Corrigan—to do a daring feat. Corriganism became synonymous with recklessness. Manhattan Corriganitis described the hysterical acclaim with which he was met on his return to the United States.

crab, v. To head an aeroplane into a cross wind to counteract drift.

Dagenan. Trade name applied in the United States to a pneumonia-combating chemical (hydroxyethylapocupreine). The British name *T693* was coded shortening of the full chemical word-formula.

Dapp. The Mexican government's system of press censorship.

deadpan. Expressionless countenance. Slang. (-1936)

desterilization. The release by the U.S. treasury of inactive gold reserves. See sterilization of gold, in 1937 list.

dime store. A ten cent store. Also 5-and-10, both singly and in combination, as "Barbara Hutton, the 5-and-10 heiress."

Divinism. A nation-wide religious cult led by "Father Divine," Harlem Negro (legal name, George Baker). His followers called themselves angels, and the cult head-quarters in a luxurious Hudson river estate became known as paradise. Cult slogan: "Peace, it's wonderful!"

documentary, adj. Applied to an artistic presentation of factual material; as the U.S. government's documentary film "The River."

double-talk, n. Talk or writing that ostensibly is meaningful but is a mixture of sense and gibberish.

drive-in, n. & adj. Roadside restaurant serving customers in their automobiles; suburban moving picture shows viewed by patrons in their cars; banking service given to customers in their cars.

Dunningcolor. Three-hue colourfilm, used in advertising. educational orders. Government orders for war material awarded to selected firms to enable them to perfect methods of large-scale production in advance of actual need by the armed forces.

egg in your beer. An unreasonable demand. Slang. enterprise capital. Proprietor's capital, risk-bearing capital, venture capital.

escapism. Turning of the mind from routine and reality to more pleasing imaginative activity. Escapist, adj., as in escapist literature; escape, adj. as in escape mechanism—

any means employed in "escaping" from reality.

fact-finding, n. & adj. The process of ascertaining the facts in a case by careful investigation, as by a congressional committee. Also fact seeker.

Fair Labor Standards Act. U.S. federal legislation, dealing with wages, hours and child labour.

feathering, n. & adj. Pertaining to a device which enables the pilot of an aeroplane in flight to turn the propeller blades so that they present their edges rather than their flat surfaces to the resistance of the air mass.

Fiberglas. Trade name applied to fine tough strands drawn from molten glass and spun into textiles or made into sound and heat insulation.

five-suit bridge. Originated by Dr. Walter Marseilles of Vienna; a game employing a 65 card deck.

Flat Foot Floogee with the Floy-Floy. A popular swing dance and song, the latter written in jive talk.

Floxalan. A synthetic wool fabric made from cellulose. fluorescent lamp. A tubular electric lamp which uses mercury vapour instead of a filament and produces much illumination.

flying squadron. A committee organized for quick and effective action; as in politics, labour union strikes and police patrols. Or flying squad. (-1934)

front. A figurehead.

gagaism. Modernistic art.

gangster nations. The axis. Also international gangsters.

Garand rifle. A semi-automatic, gas-operated rifle, used by the U.S. army.

gastrin. A hormone located in the inner lining of the lower end of the stomach, discovered by Dr. S. A. Kamarov, of McGill university.

giropilot. A mechanism for steering an aeroplane after it has gained its desired cruising altitude. Also gyroscopic pilot and gyropilot. Also mechanical mike. Slang.

glamour boys. Actors, athletes, aviators and other men appealing to the popular U.S. fancy. Slang.

glamour girls. Actresses and society girls noted for beauty and "oomph." Slang.

googol. An arbitrarily coined word intended to denote the number formed by the numeral "1" followed by 100 zeros.

green light, to give the. To grant permission to proceed with a project. Colloq.

hair-do. Woman's coiffure.

Ham and Eggs for Californians. An old-age pension scheme, planned by Lawrence Allen, a Hollywood lawyer, based on the stamped-scrip idea, promising "\$30 every Thursday" to each jobless Californian more than 50 years old. Also Ham-and-Eggers, adherents of the plan.

heel. A contemptible person. Slang.

Henleinite. Follower of Konrad Henlein, Sudeten nazi leader. Also Henleinist. The Free Corps of nazis in Czechoslovakia were Sudeten exiles who demanded autonomy.

high-light, v. To give prominence to.

hit-and-run driver. A motorist leaving the scene of an accident illegally after striking someone.

ideology. A system of theories and aims constituting a program, as New Deal ideology. Ideologist, n., and ideological, adj.

institutional. Descriptive of advertising aimed to create good will and prestige for a company. Cant.

integration. The combination of companies or industries through stock purchase. A wagon-wheel is such a combination in which the components are clustered around a large city or consumption area. The clothesline type of

combination is made up of geographically separated units loosely strung together.

jitterbug. A small industrial truck for handling internal [within a factory] materials. Slang.

jive, v. To play swing music. Jive talk, the lingo of swing musicians.

jobholder. An employe of the U.S. federal government. juicer. A machine to extract fruit and vegetable juices. La Follette party. The National Progressive party, or-

ganized by Robert and Philip La Follette in 1938.

Lambeth Walk. A novelty dance imported into the United States from England; a restrained sort of Big Apple.

live, adj. Applied to radio network programs in which the performers actually appeared in the studio; opposed to recorded or transcribed programs.

Lovelace mask. The substratosphere oxygen mask for aviators, tested by Howard Hughes. Also B.L.B. inhalator, named for the three designers, Drs. Boothby, Lovelace and Bulbulian.

Ludlite. A fireproof building-sheathing material consisting of a thin sheet of stainless steel bonded to a layer of sound-deadening composition board. Full trade name, Ludlite Bord.

lug, n. Political pressure for campaign funds (-1936). Also kickback. Slang.

mercy killing. Euthanasia or painless death for the incurably ailing.

methylcholanthrene. Powerful carcinogen (cancer-producing chemical).

Metrazol. Trade name for a camphor derivative used in treating mental disorders.

Navicert. (Naval Certificate.) A maritime bill of lading devised in 1916, when the American consul-general in London persuaded the British admiralty to establish a method of determining in advance the senders, receivers and contents of cargoes carried by neutral ships, to prevent enemy receipt of such cargoes. A war word revived in 1938.

neutretto. An electrically neutral atomic particle.

Number 1. The most important member or exponent; Number 1 educator.

Number 2. Second in importance; Number 2 nazi (Goering).

Nylon. Yarn 66 of the Du Pont company. The name was coined by company chemists to designate a whole group of synthetic polyamides.

oomph. A term made by onomatopoeia to express male appraisal of female beauty and charm. Ann Sheridan was the first U.S. "Oomph Girl." (-1936) *Time* magazine used gazoomph and gazoomphing. Also umph.

open city or town. Undefended; hence immune under international law from attack by an enemy power.

Oslo Group. Seven powers (Denmark, Sweden, Norway, Finland, the Netherlands, Belgium and Luxembourg) banded together in 1936 to foster economic and political co-operation. Also Oslo Powers, Oslo States and Noninterveners.

outside route. An airline from the U.S. to Alaska over the open sea; opposed to inside route.

pickaback plane. "Composite" plane (see 1937 list). Also piggyback. Slang.

pipe, v. To transmit 1 adio programs by telephone wires to restaurants, etc.

pipe line. A means of transmission of ideas; as information from abroad to the U.S. press.

631

predicator. Electric sighting mechanism on British anti-

pressure, v. To force passage or defeat of legislation or alter public policy through unofficial channels. Also, pressure campaign and pressure group.

Progressivism. The theory of education holding that children learn best by their own experience. Introduced into the United States about 1918 by John Dewey, who adapted the principles of Froebel and Rousseau. Also, progressive, adj.

protective arrest. Detention, often in concentration camps of those disagreeing with the views of rulers, as Pastor Martin Niemoeller in nazi Germany. Or protective custody.

racism. A doctrine based on the assumption that certain races are inherently superior. Also, racist, adj., and racial, adj.

racial fitness. The anti-Jewish policy of the Third Reich of sterilizing those persons who did not pass "racial fitness" tests.

radio knife. An electric needle used for cutting through tissue, sterilizing the edges of the wound at the same time.

rank-and-filers. Members of labour unions, as opposed to the leaders.

Revisionist, Jewish. An extremist political party in Palestine which wished to drive out the Arabs.

scorched earth. A policy adopted by retreating armies of destroying property which might have possible use to the enemy. Usually scorched earth tactics.

screwball. Anything acting crazily. (1) In baseball, a variety of pitched ball made famous by Carl Hubbell and "Lefty" Gomez; also screwballist. (2) A fanatic, eccentric or zany. Slang.

Siegfried Line. The nazi line of concrete fortifications along the Rhine, begun in 1936.

Silk Road. The caravan route linking Russia and China, once used by Marco Polo. Also Silk Route and Marco Polo Route.

situation. Irregularity or fraud. Also, special situation and Wall Street situation.

sound conditioning. The use of filters in air-conditioning ducts to keep sound from travelling to other parts of the building.

spiral, n. In economics, a rapid increase or decrease; as the downward spiral of the 1938 recession in the United States.

spot, adj. Originating in a local radio station, as spot advertising.

Sterilamp. The Westinghouse germ-killing, air-conditioning lamp used in hospitals and other public places.

stork derby. The contest among mothers of large families in Canada to secure a share of the \$500,000 stork derby prize provided by the bequest of C. V. Millar. Also, baby derby.

subsistence homestead. A co-operative community financed by loans from the Farm Security administration. Among the projects were the Cumberland, Penderlea, Red House and Skyline homesteads. Members were known as homesteaders.

super-cyclotron. An atom-smashing machine of great power.

tape transmission. A narrow continuous film used in recorded radio programs (-1936).

TASS (Rus. Telegraphnoye Agenstvo Sovyetskovo Soyuza). The soviet news agency.

televisigraph. A patented device for writing by television.

Tergitol. Trade name for a chemical wetting agent. thought control. Japanese censorship system in which police arrested persons suspected of having "dangerous thoughts."

Time Capsule. A seven-foot long, torpedo-shaped shell of Cupaloy (an alloy of copper, chromium and silver) buried on the grounds of the New York World's Fair, containing 10,000,000 printed words on microfilm, 1,000 photographs, a dictionary of slang, the World Almanac, periodicals and excerpts from the Encyclopædia Britannica.

Trubenizing. A patented process for producing semistiff collars. (1934) A patent for a method of wilt-proofing collars was taken out by the Celanese corporation in

Upsweep hair-do. A favoured coiffure of women in 1938.

Vitamins L-1 and L-2. Two new vitamins reported by Japanese scientists, extracted from liver and yeast.

Vitamin K. The diet factor influencing coagulation of blood; discovered by Dr. E. A. Doisy.

warphan. A child whose father and mother had been killed in war.

war weariness. Low morale among the general public in wartime. Also, war-weary, adj.

wire photo. A service, begun in 1935 by the Associated Press, to transmit a facsimile of a photograph by electrical signals over telephone wires.

yardstick. A unit of measure for determining the cost of production of electric power, milk, farm machinery, etc. Federal projects were set up to attempt to establish costs and prices.

1939

The new words for 1939 had a background of war. Hundreds of strange terms appeared, naming munitions, mines and anti-mine devices, mechanized war equipment and lines of fortifications in Europe.

In the U.S., however, many persons were attending the two great World's Fairs—in New York city and in San Francisco—where the exhibits showed many new wonders of science.

* * *

absolute. Measured from the ground, in aeronautics; as, the absolute altimeter.

abstraction. An abstract composition in art representing an idea or an emotion by means of nonrepresentational designs. Abstractionist and semi-abstractionist designated the artists. Near abstraction was a nonrepresentational design with recognizable elements.

aerial mine. A large bomb dropped from an aeroplane in flight and delayed in descent by a parachute. Also chute and parachute mine.

air raid bulbs. Dimmed blue street lights giving no more than two yards vision. Also A.R.P. lights.

air raid warden. A local officer directing air raid precautions.

Alnico. General Electric's permanent magnet alloy capable of hoisting weights nearly 1,500 times heavier than itself. It was used also in loudspeakers and phonograph pickups.

Anderson shelter. A sheet-steel hovel, sunk several feet into the ground and covered with earth. One million were distributed free in Britain by Sir John Anderson, A.R.P. head. Also doghouse air raid shelter. Slang.

antenna mine. A large naval mine with projecting wire

filaments, exploding on contact with a metal object, such as a passing ship.

anti-aircraft sound detector. A mechanism with large horns pointing skyward, mounted on a truck. Also sound locator. Also mechanical ears. Slang.

area bombing. The royal air force method of highaltitude bombing of large areas; opposed to precision bombing.

A.R.P. codes. The code word "yellow" signified the bombers were 20 minutes away; "red," 5 minutes; "green," all clear.

bail out, v.i. To make a parachute jump from an aeroplane in flight.

baby bonus. The offering of prizes for large families. Mussolini spent \$3,000,000 for prizes to Italian mothers during a single year.

banana-town. A town in the Latin-American tropics. Slang.

bank. A storage place for a reserve supply; as a blood bank, with blood for transfusions kept in refrigerated containers.

barbiturate. A drug used as a sedative or hypnotic; sold under a variety of trade names. Also **lullaby pills.** *Slang.*

beam at, v. To aim a radio broadcast at certain receiving stations; as German propaganda programs beamed at North America. (-1933)

black. Illicit; as the black bourse in New York city, where smuggled German marks were bought from German refugees.

blackout fashions. Women's costumes in London and Paris included many white accessories as a safety measure during blackouts. White patches were also sewn on the sleeves of both women and men.

blitzkrieg, sea. Submarine mine warfare.

blueprint, n. and v. A plan for anything; as, blueprints for "Mobilization Day."

 $\mathbf{B}_{\mathbf{x}}$ vitamin. A growth vitamin of the B groups; antagonistic to the action of the sulfanilamides. Also antigray-hair vitamin.

C.A.B. (Co-operative Analysis of Broadcasting.) A confidential poll for radio advertisers and their agencies. See Crossley rating and Hooper-Holmes survey.

Chamberlain fashions. Hats, combs, and fur-handled umbrellas, named for Prime Minister Chamberlain, featured in U.S. fashions. In Belgium, citizens called an umbrella un Chamberlain. In Normandy, a new dance was named La Chamberlaine.

consumer subsidy. A plan to move surplus farm products by a two-price system; proposed by the department of agriculture. Reliefers (persons on government relief) were to be issued bonus checks or relief stamps (blue and orange stamps), for which they could buy surplus foods at reduced prices.

critical materials. Those materials essential to national defense which were not so difficult to secure as strategic materials. The U.S. government listed 17 in 1939, including asbestos and vanadium. Or critical commodities. See essential materials.

Crossley rating. A weekly index on a radio program's audience.

cyclical budgeting. The plan of Marriner S. Eccles to abandon annual budgeting for the federal treasury. Its opponents called it the Spend and Wait theory.

decontaminate. To free of poison gas.

Domei (Domei Tsushin-sha). Official Japanese Federated News agency.

dust-bowler. An inhabitant of the Dust Bowl.

dry shaver. An electric shaver.

Egalitarian Women's Party. Advocates of equal rights for women. Opposed to protectionists.

Ekarhenium. Discovered by Prof. Jean Baptiste Perrin in pitchblende ore, in a natural state; the same element as No. 93, synthesized in 1934 by Prof. Enrico Fermi.

electric apron. A powerful magnetic force that could be thrown some hundreds of feet ahead of mine sweepers to render magnetic mines inactive.

electric organ. A musical instrument using electric devices instead of wind; especially the *Hammond organ*.

electronic microscope. A supermicroscope using the invisible rays given off by electrons.

essential materials. Those materials essential to national defense which were not classified as critical or strategic but which later might be so classified.

evacuation camps. British camps in the country for women and children evacuated from bomb-threatened London.

exposition feet. A slight case of gout aggravated by excessive walking, as at the New York World's fair and the Golden Gate International exposition in San Francisco.

F.A.F. (fly-away field). Descriptive of a completed plane, ready to be flown away; as, listing at \$2,995 F.A.F. Wayne, Mich.

farm, n. & v. A system, in professional sports, wherein a recruit is assigned to a minor league for training until he is needed by an associated major league.

Flying Pencil. Dornier-17 plane.

flying wing. A type of aeroplane with a specially designed wing, without fuselage and with pusher-type engine.

fog disperser. Calcium chloride to dispel fog endangering docking ships; under experimentation in 1938 at the Massachusetts Institute of Technology.

fog dispersion beam. System of sending out a beam of infra-red rays, which cuts a clear-vision channel through smoke or fog; for airmen, mariners, etc.

fortify. To improve a food in nutritive value by adding vitamins and minerals when processing destroys the factors; as pasteurized milk fortified by the addition of vitamins A and D.

Futurama. A diorama designed by Norman Bel Geddes for the General Motors exhibit at the N.Y. World's Fair, portraying superhighways and other methods of modelling traffic in the future.

ground crew. A crew of mechanics and technicians maintaining and servicing a plane. Opposed to flight crew.

gun, v. To open up the throttle of a motor to increase its speed; as to gun a plane.

Harbour Service. A German saboteur spy working in the great world ports during peacetime. More common types of secret agents were termites (spreading rumours to lower a country's morale) and torpedoes (active wreckers and assassins).

harmonic synthesizer-analyzer. A machine for solving complex mathematical equations.

Hatch Act. Act barring U.S. federal employees from engaging in national political campaigns.

Hooper-Holmes survey. An investigation of the listening habits of radio audiences. Later, Hooper rating.

Hydra-matic Drive. A combination of "a liquid flywheel and fully automatic transmission" to eliminate gear shifting; developed by General Motors. 33

infiltration, troop. Enveloping tactics combined with the encircling manoeuvre; used by the Germans in their operations in Poland in 1939. Described by the German general staff as putting the enemy in *Beutels* (bags). .

Information Please. A radio quiz show born on May 17,

interceptor plane. Speedy light plane with quick-firing cannon. Also, interceptor-pursuit, pursuit-interceptor and interceptor fighter.

iron horse. The U.S. army combat car; a tank-type vehicle assigned to the mechanized cavalry. Also, iron cavalry.

Ivy Leaguer. Member of a big-time Eastern university football team. John Lardner divided them into two groups: hedera helix (true ivy) and rhus toxicodendron (poison ivy). The latter were paid players.

Janizariat. President F. D. Roosevelt's close advisers, including Tommy Corcoran, their head; borrowed from old Turkish term by Gen. Hugh S. Johnson. Also called the Corcoran Crowd.

Jones's corner. The spot at which the clippers changed their course in flying between California and Hawaii. Aviators' slang.

klystron. A super-short-wave radio transmitter.

lending-spending program. By law President Roosevelt was granted \$5,000,000,000 for relief projects. Also spendlend.

Limes Line. A name given by Hitler in 1939 to the Siegfried line, from the ancient term applied to the Germanic outposts of the Roman empire. Pronounced: lee-mez.

Lincoln Brigade. The Abraham Lincoln Battalion of the International Brigade (Loyalists) in the Spanish Civil War, made up of volunteers. Spanish volunteers fought in such numbers as to warrant the Spanish conflict's being called Little World War after Aug. 1936.

linear resonant accelerator. An 8-foot-high glass tube atom-smasher which impels the particles in a straight line. macon. Mutton smoked to approximate bacon; an experiment of the British ministry of food.

magnetic mine. A naval mine designed to explode when its magnetic needle is deflected by the proximity of the metal hull of a vessel.

Mannerheim Line. The Finnish line of fortifications, named after Baron Mannerheim.

marathoner. A participant in one of the many competitions calling for endurance; as Bible-reading, bike-racing, dancing, etc.

maturism. The theory of economic maturity advanced by President Roosevelt at the opening of congress, Jan. 1939; the belief that the U.S. economic system was no longer capable of being self-supporting on a free-enterprise basis.

Melba toast. Very thin toasted bread, originated by Mme. Marie Ritz, and named for Mme. Melba, who was stopping at the same hotel.

microscalpel. A glass instrument with a 1/1,000,000-inch point.

microvivarium. Micro-organisms projected on a fivefoot screen; a New York World's fair exhibit.

monitor, $v.\ t.$ To check short-wave receivers; as by interpreters listening to European broadcasters for possible news flashes.

moto-rustlers. Modernized cattle thieves who packed steers into trucks. (-1986)

Munich, A. Any appeasement pact; as "a new Munich."

Neohexane. A process to increase gasoline's octane rating.

nickelodeon. A machine which plays a music record when a coin (nickel) is put in a slot.

night owl broadcast. Illegal early morning radio program. Also bootleg broadcast.

night raid. To bomb at night.

Nisei. A second-generation Japanese in the U.S.; a citizen of Japanese ancestry. Also Nissei.

Novachord. Trade name for a stringless piano with piano and harpsichord tones, invented by Laurens Hammond

nursery school. A pre-kindergarten school which extends scientific upbringing to children aged two to five.

octane rating. Establishment in 1927 of the octane number scale rated the anti-knock quality of a motor fuel. 100-octane gas was first used in 1936.

package, n. and adj. A unit containing miscellaneous elements. A package offered by brokers might contain some securities with excellent earning records, some that were speculations. General Motors produced a packaged power unit of engine and generator; the radio networks had packaged programs of transcribed numbers. Also package-sale.

Panelbilt House. The U.S. Steel corporation's prefabricated house.

paper bullet. A form of psychological warfare in which propaganda leaflets were dropped by plane in enemy territory. Also bomphlet and throwaway.

parentorium. A parent guidance centre where parents were taught to help cure their offspring of speech disorders.

penetration, nazi. German propaganda activities.

phony war. The "sitzkrieg," or non-active war on the western front, dating from Sept. 1939.

photogenic. Very suitable for being photographed.

pianothon. A piano-playing marathon.

pops. Concerts of popular music.

polymethylacrylate. A tough, rubberlike, transparent material made from milk; used in the manufacture of sails, balloon cloth and anti-war-gas uniforms.

polystyrene. A colourless, transparent thermoplastic made from mineral oil.

polythene. A solid hydrocarbon polymer, discovered in the laboratories of the Imperial Chemicals Industry, Ltd. of Great Britain and further developed by Du Pont; valuable for wire and cable insulation.

Polyvinyl Acetate. A Monsanto plastic, used in the manufacture of safety glass.

psychological warfare. Propaganda designed to break down the morale of the enemy, both those in the armed services and civilians. Also called radio armament, leaflet raids, war of nerves.

put the finger on. To point out as the intended victim. Originally racketeer slang.

radiocast, n. A radio broadcast.

radio photo. A facsimile of a photograph transmitted long distances by electrical impulse instead of by wire. International Radio photos offered this service.

R man. An air-wave detective of one of the Federal Communications commission monitoring stations, who watched for unlicensed operations, checked on the efficiency of ship transmitters and recorded questionable programs.

red, walking on the. A street traffic signal violation. Republicart. One who withdrew temporarily from the Republican party in April 1938 to vote with the Democrats. (1935)

robot plane. Crewless, radio-controlled plane, directed both from land stations and from bombers. Also robot bomber.

rugcutter. A swing dancer. (-1938)

safety-belt. A safety zone proclaimed by 21 American republics at the Panama Neutrality convention in Dec. 1938; to run from the Canadian line around both the eastern and western coasts of the Americas, at an average of 300 mi. from shore. Known also as the hemispheric defense zone.

safety glass, high-test. Two layers of glass with an inner layer of polyvinal acetate resin, used in automobiles.

sealed beam. Headlamps for automobiles, with the reflector, the light source and the lens in a single, hermetically sealed unit.

secret weapon, Hitler's. The magnetic mine, the parachute mine and the use of the loudspeaker for propaganda purposes were among the various new weapons which the allies thought might be the secret weapon hinted at by Hitler.

Singapore, American. Guam, which the U.S. navy hoped to fortify strongly. A French Singapore in Indo-China was also planned.

sitathon. A marathon motion picture show with seven full-length films.

sitzkrieg. (Sitting war.) An inactive war, as opposed to the blitzkrieg of the nazis.

Six-man football. Introduced by Stephen Epler, on the Columbia university campus, following the success of the six-man football game which he introduced in 1934; the latter was played by 2,100 schools in 1938.

slap-happy. Witless. Originally pugilistic slang. (-1938) soup. Horsepower. Corruption of supe from supercharge. Aviation slang. (-1937)

soup up. To step up the power of an engine.

S.S. (Schutzstaffel.) Hitler's bodyguard; known also as the Black Shirt Guard (Schwarzhemd) because of their black uniforms. Superseded the S.A. (Sturmabteilung, Brown Shirts, Storm Troopers) in 1934, as Hitler's favoured group.

Stader splint. A method of clamping broken bones together by running a steel pin into both ends of the break and connecting the pins with an adjustable metal bar.

Stakhanoff movement. The speed-up system in soviet industry. Stakhanoffite, the Russian superworker.

Station wagon. An automobile with a wooden body, several cross seats and a baggage compartment.

Stock pile. A reserve supply of an essential material usually built up by a nation in anticipation that war or blockade might cut off the supply.

strategic materials. Those materials, essential to national defense, which must be largely imported and which must be strictly controlled.

Stratoliner. Trade name of the Boeing 307, a four-motored substratoplane, commercial counterpart of the army's Flying Fortress. (1938)

straw-hat theatre. Summer theatre presented in many small communities throughout the United States, often by amateurs.

suicide fleet. Mine sweepers.

supernova. A nova hundreds of times brighter than common novae (black, lightless stars).

super tank. A tank weighing 80 tons or more.

talkathon. A talking marathon; that is, a protracted legislative debate.

tank trap. Artificial obstacles of many sorts—thick vertical walls of concrete, deep shell craters, cement or steel posts, bunkers, abatis (tree branches interwoven with

barbed wire), etc.

teardrop design. Streamlined, as automobile bodies. telecast, v. To broadcast by television.

telegenic. Suitable for photographing for television.

third-termers; anti-third-termers. 'Persons in favour of President Roosevelt's being elected to a third term or opposed to it, respectively.

tin fish. A submarine. Slang.

T-man. (Treasury-man.) Special agent of the U.S. treasury department.

Tommie gun. A Thompson submachine gun.

video. Pertaining to the transmission of televised images. Television waves, after radio-frequency amplification, are split into video and audio impulses.

Voder, (voice operation demonstrator.) A mechanism to provide speech for persons who have lost their larynxes. Nicknamed **Pedro**. An earlier form of the machine was called *Vosyn*.

war chest. Funds deposited in U.S. by foreign governments for war materials to be bought in the U.S.

war names. Suggested by correspondents to magazines during 1939 were the following: Hitler's War, European Power War, Nervy Nazi War, Nutsy War, Ritzkrieg, Weird War, the Word War, The Little War that Wasn't There, World War II.

war of nerves. Psychological warfare, resulting in war fever, war hysteria and war jitters.

West Point of the Air. Randolph Field, Texas.

West Wall. Hitler's definition: "West wall is for all times the Reich frontier in the west." Nazi newspapers first called the German fortifications the Siegfried line, then adopted *Limes*, and rechristened them the West Wall.

wild mine. An unanchored or free sea mine.

Youth Hostel, American. An affiliate of International Youth Hostels association, which was organized in the U.S. by Monroe Smith. In 1939 300 leaders held their second annual meeting in Northfield, Mass.

(M. J. M.)

1940

AA. See ack-ack.

ack-ack. (From ack, the word used by British signallers for "a.") Short for anti-aircraft gun; also the fire of one or more anti-aircraft batteries. Also AA.

action station. (Brit.) Place on shipboard to which a man is assigned during an action against the enemy.

aeroembolism. A painful embolism consisting of bubbles of nitrogen in the blood and the tissues, resulting from a too rapid ascent to rarefied altitudes of 30,000 ft. or more; relieved by oxygen. (-1940)

airblitz. Aerial blitzkrieg.

airplot room. Room for planning air operations.

anchor. A vital military position, a base of operations for an important area.

anoxia. State of being without adequate oxygen, esp. common among fliers at altitudes over 15,000 ft. unless adequately protected.

asdic. Initials of Anti-Submarine Detection Investigating Committee, a device for detecting and locating submarines by the use of reflected inaudible sound waves. (1989)

bar-fly, Slang. A frequenter of bars or drinking-places. barroon. (Brit.) A barrage of balloons.

basin-hat. (Brit.) A steel helmet. See bassinet.

bassinet. (Brit.) A steel helmet; also called tin hat. From the pronunciation of basin-hat.

635

beach-head. A foothold gained and held on an enemy beach to make possible the landing of troops and supplies in sufficient number and quantity for further advances.

billetee. (Brit.) One evacuated from a section in danger of being bombed.

blister turret. A small compartment, usually for a gunner, protruding above the top of the fuselage of an aeroplane and equipped with a transparent covering shaped like a blister.

blitz, v. (Ger. lightning.) To attack with lightning-like rapidity and force, esp. from the air. blitz, n. Short for blitzkrieg (see 1938 list).

Blitz, or The Blitz. The bombing of Great Britain by the German airforce extending from Aug. 1940, to May 1941.

blitzer. See blitzkrieger.

blitzflu. A type of influenza with quick onset and rapid recovery.

blitzkrieger. One engaging in a blitzkrieg. Also called blitzer.

blitzlull. (Brit.) A letup in a blitz.

bombardier. That crewman of a bomber who, through the use of a bombsight, drops the bombs at the proper time

bomb bay. A bay in the bottom of the fuselage of a bomber where the bombs are stored and from which they are dropped after the bomb bay doors are opened.

bombee. One who has gone through an air raid.

brown off. R.A.F. Slang. To have had one's fill; to suffer from ennui; to be in low spirits. (Old Brit. slang term revived in World War II.)

buttoned up. R.A.F. Slang. Prepared in every detail; orders distinctly comprehended, or executed; consummated attack.

cabineteer. A member of a cabinet.

camporee. A word blended from camp and jamboree to describe a meeting of Boy Scouts drawn from a district or section of the country.

car-hop. One, usually young, who waits on patrons in parked automobiles.

cat. Slang. A shortening of caterpillar tractor.

cat skinner. Slang. One who drives a caterpillar tractor. chatter-bug. (Brit.) Term coined by Harold Nicolson, parliamentary secretary to the minister of information, to describe a civilian whose loose talk (chatter) revealed military facts.

chutist. Short for parachutist.

Clara. (Brit.) Employed by Londoners for the all-clear signal.

combined operations. An operation in which at least two fighting services combined to assault an enemy.

conscriptee. One conscripted.

coventrate, v. t. See coventrize.

coventrize, coventryize, v. t. To make rubble of a city as was done by the Germans at Coventry during the night of Nov. 14–15, 1940, when an estimated 500 German bombers dropped some 1,100,000 lb. of bombs. Also coventrate.

crashproof. Of an aeroplane and its equipment, proof against damage as a result of crashing. (-1940)

Cunningham's comet. A comet discovered by Leland E. Cunningham.

curb, v. t. To take (a dog) to the curb; as, curb your dog. curvaceous, adj. Well-shaped, exhibiting curves; in reference to the female body.
